295	Wood, J., Pt., A, 3d Maryland Cavalry, age 21.	May 18, June 3, 1864.	Right; double flap. A. A. Surg. C. Bauseh. Died June 11, 1864; pyæmia.
296	York, M., Pt., E, 120th New York, age 20.	July 2, 27, '63.	Left. A. A. Surg. F. Hinkle. (Gang.) July 28, amp. right leg, lower third. Died Aug. 8, 1863; exhaustion. *Specs.* 1605, 1609.

The operations were performed in the right leg in one hundred and twenty-seven and in the left leg in one hundred and fifty-eight instances; in eleven cases the side was not indicated.

Intermediary Amputations in the Middle Third of the Leg.—Three hundred and sixty-eight cases of intermediary amputations in the middle third of the leg are found on the records. The terminations are ascertained in all: two hundred and fifty-eight ended in recovery and one hundred and ten in death, a mortality rate of 29.8 per cent.

Recoveries after Intermediary Amputations in the Middle Third of the Leg.—The two hundred and fifty-eight operations of this group were performed on two hundred and thirteen Union and forty-four Confederate soldiers; in one instance the patient was a citizen employé. Of the two hundred and thirteen Union soldiers the names of two hundred and

[1] Lidell (J. A.), *On the Major Amputations for Injuries in both Civil and Military Practice*, in *Am. Jour. Med. Sci's*, 1864, Vol. XLVII, p. 365.

ten were found on the Pension Rolls. Fourteen have died since the date of their discharge, one from constant discharge of stump, six from phthisis, and seven from causes not stated. In four instances amputation in the thigh was subsequently performed.

CASE 763.—Private G. W. Smith, Co. F, 76th New York, aged 20 years, was wounded in the left leg, at Gettysburg, July 1, 1863. He was conveyed to a field hospital of the First Corps, where amputation was performed but not recorded. Surgeon H. Janes, U. S. V., reported that the wounded man was admitted to Camp Letterman August 20th, his injured leg having been previously amputated, also that the patient did well and required no other treatment than simple dressings to the wound. Surgeon B. A. Clements, U. S. A., reported the following description and termination of the case: "The injury involved the ankle joint and was caused by a minié ball, which passed through antero-posteriorly, fracturing the bones. The leg was amputated by the circular method, at the Express Office Hospital, Gettysburg, five days after the reception of the injury. The man at the same time was wounded by another ball in the upper part of the left thigh. This was a flesh wound and healed in about two months. The stump healed kindly, and was entirely well when the patient was transferred to Central Park Hospital, New York City, on October 14th. In December following the stump ulcerated and a portion of a ligature escaped, after which it again healed." On May 20, 1864, when discharged from service at his own request, the patient's general condition was good and motion of the knee joint perfect. After leaving the hospital he was furnished with a "Palmer" artificial leg. In his application for commutation the pensioner describes the stump as remaining in "good condition," and states that Surgeon J. H. Beach, 24th Michigan, performed the amputation. The pensioner was paid March 4, 1880. A cast of the stump (*Spec.* 4318), showing amputation to have been performed at the middle third, and exhibiting the curious marking of an equal-armed cross on the cicatrix, was contributed by Acting Assistant Surgeon G. F. Shrady, and is represented in the wood-cut (FIG. 300).

FIG. 300.—Stump of left leg 10 months after circular amputation in middle third. *Spec.* 4318. [From a cast.]

CASE 764.—Private G. Cullom,[1] Co. D, 83d Ohio, aged 20 years, was severely wounded in the left ankle joint, at Champion Hills, May 16, 1863. He entered and remained at a field hospital for three weeks, when he was sent on board of a Hospital transport. Assistant Surgeon H. M. Sprague, U. S. A., recorded the wounded man's admission on board of the Steamer City of Memphis, June 8th, and his transfer to Jackson Hospital, Memphis, June 14th. Surgeon W. Watson, U. S. V., in charge of Jackson Hospital, contributed the pathological specimen with the following history: "The patient was under the attendance of Acting Assistant Surgeon J. Witham. When admitted he was very much reduced by diarrhœa, greatly emaciated, and suffering from extensive bed-sores over the sacrum. He had undergone amputation of the wounded leg, eight inches below the knee, previous to admission, and both bones were protruding from the stump. Simple dressings were used and adhesive plasters applied to the bed-sores, and he was allowed a generous and nourishing diet, with porter. On June 18th, he was placed upon a water-bed, after which a constant but slow improvement ensued and the stump was healing. On August 25th the bone, having become entirely detached, was removed. After this operation the patient's progress was more rapid, and he acquired strength enough to go about on crutches. On September 30th, when the patient was transferred to St. Louis, the stump had nearly healed." The removed fragment (*Cat. Surg. Sect.*, 1866, p 405, *Spec.* 2099), consisting of semi-tubular sequestrum from the tibia, five inches in length, is represented on PLATE LXXI, FIGURE 4, opposite page 428. The patient was discharged from service, at Jefferson Barracks Hospital, October 19, 1863, and pensioned. In the following year he was supplied with an artificial limb by Dr. Douglas Bly who described the amputation as having been performed by the flap method. In his application for commutation, dated 1870, the pensioner stated that his limb was amputated twenty-five days after the reception of the injury. The pensioner died August 27, 1872, of consumption, superinduced by the amputation, his attending physician certifying that the stump never healed and never ceased to suppurate, discharging fragments of bone at times.

FIG. 301.—Fractures in lower thirds of the bones of left leg. *Spec.* 2284.

CASE 765.—Private J. Sterritt, Co. C, 119th Pennsylvania, aged 39 years, was wounded in the lower part of the left leg, at Spottsylvania, May 10, 1864. Surgeon O. A. Judson, U. S. V., contributed the pathological specimen, shown in the annexed wood-cut (FIG. 301), with the following history: "The wound was caused by a conoidal ball entering the leg anteriorly about three inches above the ankle joint, passing transversely through, producing compound comminuted fracture of the lower third of the tibia and involving the ankle joint. The man entered Carver Hospital, Washington, three days after being wounded. At the date of his admission the injured ankle was tumid, red, and painful, and the foot œdematous; but his constitutional state was good and there was no emaciation. On May 14th the patient was etherized and the parts were examined, when the severity of the fracture was discovered and pus was found to have burrowed freely about the ankle joint. Consequently the leg was amputated at the middle third by the skin-flap method and circular section of muscles. The operation was performed by Acting Assistant Surgeon O. P. Sweet. The patient reacted well from the shock of the operation and continued to do well. Simple dressings were applied to the stump and stimulants were administered. About half of the anterior flap sloughed, but by June 1st the stump looked well and secreted laudable pus; granulations red and healthy. About June 12th an abscess formed on the crest of the tibia, probably resulting from necrosis of a small portion of the bone." The patient recovered and subsequently passed through different hospitals, being ultimately discharged August 7, 1865, and pensioned. Previous to leaving the service he was supplied with an artificial leg. In his application for commutation, dated 1870, he described the condition of the stump as "unhealthy at present," and six years later he reported it as "inclined to be sore." The pensioner was paid June 4, 1880. The specimen (No. 2284) consists of the amputated portions

[1] BRYAN (JAMES), *Seventeen Additional Cases of Amputations from the Armies of the South-West*, in *American Medical Times*, 1863, Vol. VII, p. 288.

of the bones of the leg, and shows the extremities of the fibula to have been carried away and the adjacent portion of the tibia to be broken. Another fracture, where the bone was chipped, is also exhibited five and a half inches above the joint, from which longitudinal fractures extend into the articulation.

CASE 766.—Sergeant J. Peart, Co. A, 21st New York Cavalry, aged 22 years, was wounded in the left leg, at Ashby's Gap, July 18, 1864, and entered the General Hospital at Frederick nine days afterwards. Assistant Surgeon R. F. Weir, U. S. A., in charge, reported the following history: "The injury was caused by a minié ball, which shattered the tibia near the ankle. When admitted here the limb was in a very bad state, being œdematous, ecchymosed, and discolored. Amputation of the leg in the middle third was performed by Acting Assistant Surgeon J. H. Bartholf on July 31st, by lateral flaps of skin and fascia and circular method through muscles. The patient's constitutional condition at the time of the operation was fair and his health good. One week afterwards the stump became gangrenous, when nitric acid was applied with success. The patient's progress went on gradually to recovery. Though the stump was not entirely cicatrized at the end of three months it was in good shape and there was no retraction of the flaps, extension of them by weight and pulley having been adopted at the beginning. The stump was healed, and the patient in good health on December 20th, when he was transferred to Central Park Hospital, New York City, for an artificial limb." The patient was discharged from service at the latter hospital May 23, 1865, and pensioned, and several weeks afterwards he was furnished with an artificial leg. In his application for commutation the pensioner described the stump as continuing in a "healthy condition." His pension was paid March 4, 1880.

CASE 767.—Private C. Burbridge, Co. K, 88th Pennsylvania, aged 40 years, was wounded at Spottsylvania, May 10, 1864, and entered Mount Pleasant Hospital, Washington, three days afterwards. Assistant Surgeon C. A. McCall, U. S. A., reported: "The injury was caused by a minié ball entering at the internal malleolus of the right leg, comminuting the fibular extremity and the astragalus and laying bare the tendon. The parts became swollen, tense, and discolored, and synovitis was fully developed. Amputation at the junction of the middle and lower thirds of the leg was performed by the antero-posterior flap method on May 24th, by Acting Assistant Surgeon P. C. Potter. The anæsthetic was made up of two parts chloroform and one part ether. At the time of the operation the patient was in a weak and debilitated condition and failing hourly, suffering from nervous trembling, restlessness, exhausting insomnia, and severe pain, which was lancinating and at times grinding and unsupportable. There was also copious discharge of ichor from the wound, and a sinus and abscess had extended up the limb and was opened a day or two before the operation. Interrupted sutures were applied to the stump, which broke out from ulceration of the flaps on the third day. Straps were then used and a tendency to slough counteracted by antiseptic poultices. Tonics and malt drinks were administered. By June 30th, the sloughing had stopped and abundant granulations were springing up. The greatest point of difficulty in this case was produced by the flaps falling asunder at each dressing, thus breaking up the nearly healed union and allowing the tibia to protrude." In the following month the patient was transferred to York, and subsequently he passed through various hospitals at Philadelphia, being ultimately discharged from service at Chester, June 27, 1865, and pensioned. He had been previously supplied with an artificial leg. In his application for commutation, dated 1870, the pensioner described the stump as being "tender;" but in his subsequent statements he represented it in "good condition." The pensioner was paid June 4, 1880.

Fatal Cases of Intermediary Amputation in the Middle Third of the Leg.—The one hundred and ten operations of this group were performed on one hundred and nine patients, in one instance both legs having been amputated. Ninety-eight were Union and eleven Confederate soldiers. In one case the amputation in the leg was followed by amputation in the thigh in the lower third. Death is ascribed to pyæmia in thirty-four, exhaustion in eighteen, gangrene in five, and tetanus in four instances.

CASE 768.—Private J. Heakin, Co. D, 6th U. S. Cavalry, aged 24 years, was wounded in the right ankle, at the battle of Old Church, May 31, 1864. He was admitted to Stanton Hospital, Washington, four days afterwards, where amputation was performed by Surgeon J. A. Lidell, U. S. V., who made the following report:[1] "The wound was inflicted by a minié ball, which entered anteriorly, passed backward and inward, apparently going close to the posterior tibial artery and escaping behind the lower end of the tibia. The ankle joint was involved. The parts became swollen, red, and tender. During the night of June 7th the patient had secondary hæmorrhage from the wound, losing about a pint of blood, bright red in color. On the following day the leg was amputated at the place of election by double flap method, the anterior flap being shorter than the posterior, and the tibia being divided after the procedure of Sanson. Sulphuric ether constituted the anæsthetic. The loss of blood was trifling during the operation and the patient's general condition at the time was favorable, there being no constitutional disturbance worth mentioning. The shock of the operation was little and passed away quickly; reaction moderate. The patient died of pyæmia June 21, 1864. The examination of the injured member showed the lower end of the tibia to be badly comminuted into the ankle joint, which was filled with pus. The posterior tibial artery was grazed by the bullet and some very small fragments of bone had been driven into it. The hæmorrhage occurred on the detaching of these fragments by suppuration, together with the separation of the bruised tissue belonging to the wall of the artery. The astragalus was uninjured." The latter bone and the lower portion of the amputated tibia (*Spec.* 2470) were contributed to the Museum by the operator, and are represented in the wood-cut (FIG. 302).

FIG. 302.—Bones of the right ankle joint; tibia fractured. *Spec.* 2470.

CASE 769.—Private W. Nixon, Co. H, 20th Illinois, was wounded in the lower part of the right leg, near Kenesaw Mountain, June 17, 1864, by a musket ball striking the anterior surface of the tibia and entering the bone. He was admitted to a field hospital at Big Shanty, and thence, ten days later, to the general hospital at Rome. Slight hæmorrhage is said to have

[1] LIDELL (J. A.), *Secondary Hæmorrhage from Posterior Tibial Artery, etc.*, in *U. S. Sanitary Commission Memoirs*, New York, 1870, Vol. I, p. 23.

occurred on June 21st, and while being transported in the railroad cars from Big Shanty to Rome the patient bled to syncope. After several more slight hæmorrhages, which were temporarily checked by plugging the wound, it was found that the bleeding could no longer be restrained, it being impossible to secure the vessel at the point of the injury on account of extensive disorganization around the wound as well as on account of the depth of the artery and the uncertainty of finding it. Amputation was then decided upon and performed through the middle third of the leg, on July 6th, by Surgeon G. F. French, U. S. V. The ball was found in the medulla of the amputated bone, and the bleeding vessel was discovered to be the anterior tibial artery. At the time of the operation the patient was enfeebled by the loss of blood. Reaction was fair, but his condition was low; pulse feeble; lips and skin very pale. For some days his condition continued very critical. On July 27th, a slight diarrhœa came on and the patient's condition, although improved, was still critical. On August 3d, colliquative diarrhœa set in and the patient's strength was fast failing; pulse flagging; appetite entirely lost. He died on August 19, 1864, of exhaustion, though every effort had been made from the beginning to sustain his strength by a nutritious diet and the generous use of stimulants. At the time of his death the stump had almost entirely healed. The amputated tibia (*Spec.* 3382), longitudinally fractured, with a battered conoidal ball lodging in the lowest third of the bone, was contributed, with the history, by the operator, and is shown in the wood-cut (FIG. 303).

FIG. 303.—Fractured lower portion of the right tibia. *Spec.* 3382.

CASE 770.—Sergeant P. Smith, Co. K, 69th New York, aged 30 years, was wounded at Deep Bottom, August 16, 1864. Surgeon J. F. Dyer, 19th Massachusetts, reported his admission to the field hospital of the 2d division, Second Corps, with "shot fracture of both legs." Four days after receiving the injury the wounded man was admitted to Satterlee Hospital at Philadelphia, where both limbs were amputated by Acting Assistant Surgeon J. H. Hutchinson, who described the wound as follows: "A conoidal ball entered the left foot a little in front of the external malleolus, which it fractured, thence passing behind the joint and making its exit below and posterior to the internal malleolus. The missile then entered the right foot just in front of the internal malleolus, penetrated the joint, and lodged against the external malleolus, whence it was removed August 26th. Considerable difficulty was experienced in discovering the position of the ball, a large mass of loose bone having to be removed before it could be found. After the patient's admission it at once became evident that he would have to lose both feet; but it was considered more prudent to wait for the establishment of suppuration. About September 3d, both feet were discharging a large amount of healthy pus, and the patient was weak in consequence of this excessive drain, but was supported by means of quinine, beef essence, and milk punch. On September 6th I amputated both legs by the circular method, the left one above the ankle joint (at the junction of the middle and lower thirds) and the right one and a half inches higher up, the patient being etherized during the operation. By September 23d the patient, considering his situation, was still doing well. Considerable sloughing had taken place, particularly in the left stump, where the tibia was exposed. There was also two slight bed-sores notwithstanding the very careful nursing the patient received." Surgeon I. I. Hays, U. S. V., in charge of the hospital, reported that the patient died of exhaustion October 10, 1864. The amputated bones of the ankles of both legs (*Spec.* 3644) were forwarded to the Museum by the operator and are shown in the wood-cut (FIG. 304). In addition to the injuries described the specimen exhibits the left astragalus to be fractured, the base of the right tibia to be shattered, and the right fibula fractured transversely just above the malleolus as if by the propagated force. There are also traces of periosteal disturbance.

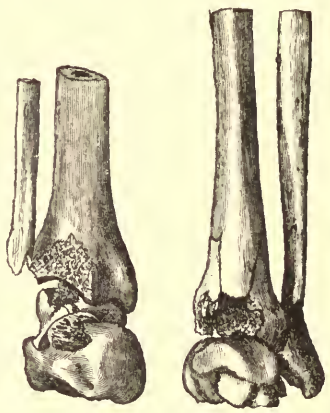

FIG. 304.—Bones of both ankles. The astragalus and outer malleolus of the left and the base of the tibia of the right ankle are fractured. *Spec.* 3644.

TABLE LXXIII.

Summary of Three Hundred and Sixty-eight Cases of Intermediary Amputations in the Middle Third of the Leg for Shot Injury.

[Recoveries, 1—258; Deaths, 259—368.]

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.	NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Ackley, C., Pt., I, 50th Pennsylvania, age 21.	May 12, 21, '64.	Right; circular. Disch'd March 28, 1865.	8	Barber, J. M., Pt., H, 21st Ohio.	Sept. 20, Oc.10,'63.	Right; circular. Discharged February 27, 1864.
2	Adams, A. B., Pt., C, 16th Maine, age 19.	Dec. 13, 22, '62.	Left. Surg. E. Bentley, U. S. V. Disch'd May 20, 1863. *Spec.* 596.	9	Barney, H. F., Pt., A, 8th New Hampshire.	July 6, 16, '63.	Right; circular. Surgeon E. A. Thompson, 12th Maine. Disch'd Sept. 27, 1863. Re-amp. in 1864.
3	Allen, C., Corp'l, G, 62d New York, age 20.	Oct. 19, 28, '64.	Right; lat. flap. A. A. Surg. C. H. Jones. Hæmorrhage. Discharged Oct. 4, 1865. *Spec.* 104.	10	Beauboucher, V., Pt., E, 28th Mass., age 27.	June 4, 8, '64.	Left; circular. Surg. E. Bentley, U. S. V. Disch'd Jan. 6, 1865.
4	Allen, H., Sergeant, G, 119th Penn., age 22.	May 3, 30, '63.	Right; flap. Surg. J. H. Baxter, U. S. V. Discharged November 14, 1863. *Specs.* 1184, 1185.	11	*Beevers, H. G.*, Pt., A, 3d Arkansas.	Sept. 21, Oc.12,'63.	Left. Surg. — Sleighton, C. S. A. Recovered.
5	Atkinson, P., Pt., G, 67th New York, age 31.	July 1, 17, '62.	Right; double flap. Ass't Surg. W. Webster, U. S. A. Disch'd April 23, 1863.	12	Bennett, C., Pt., H, 14th N. Y. State Militia.	Aug. 29, Sep.4,'62.	Left. Discharged Oct. 8, 1862.
6	Bain, T., Pt., G, 60th Illinois, age 34.	July 4, Aug. 1, 1864.	Left; flap. (July 4, excision of 4 inches of tibia.) Gangrene. Discharged May 9, 1865.	13	Benning, E., Pt., I, 52d New York, age 28.	May 12, 19, '64.	Left; double flap. A. A. Surg. J. F. Thompson. Discharged March 17, 1865.
7	*Barbee, J.*, Pt., B, 5th North Carolina, age 29.	May 12, 20, '64.	Left; anterior posterior skin flap. Surg. D. W. Bliss, U. S. V. Exchanged. *Spec.* 2312.	14	Benson, T., Pt., A, 32d Maine, age 20.	May 12, 20, '64.	Left; oval flap. Discharged September 2, 1864.
				15	Berkley, C., Pt., E, 1st Colored Troops, age 19.	June 15, July 13, 1864.	Right; posterior flap. A. Surg. J. H. Frantz, U. S. A. Disch'd July 12, 1865.

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
16	Billman, H., Pt., A, 46th Ohio, age 25.	Nov. 25, Dec. 19, 1863.	Right; flap. Surg. W. W. Bridge, 46th Ohio. Discharged March 31, 1865.
17	Bolen, J., Pt., E, 6th Mass. Cavalry, age 25.	April 8, May 7, 1864.	Right; anterior posterior skin flap. A. A. Surg. R. W. W. Carroll. Discharged October 4, 1865.
18	*Bowers, S. M.*, Pt., F, 11th Mississippi, age 21.	July 3, 7, '63.	Right; circ. Exchanged March 3, 1864.
19	*Bowles, G. S.*, Pt., G, 18th Virginia, age 27.	July 3, 7, '63.	Right; circ. Exchanged March 17, 1864.
20	Boyson, W. G., Boatswain's Mate, U. S. Steamer Osage, age 39.	Mar. 29, April 1, 1865.	Right; circ. Surg. T. J. Turner, U. S. N. Discharged August 5, 1865. Died June 20, 1868.
21	Brannan, J. J., Serg't, G, 10th W. Virginia, age 27.	Sept. 19, Oct. 14, 1864.	Right; anterior posterior flap. Surg. H. F. Garrett, 10th W. Va. Discharged August 29, 1865.
22	Bressin, C., Pt., K, 4th Ohio Cavalry.	May 2, 10, '62.	Left. Ass't Surg. T. McMillan, 4th Ohio Cavalry. Discharged July 8, 1862.
23	*Bronn, H. G.*, Pt., A, 6th Georgia.	June 27, J'y 1, '62.	——. Surgeon — McKinney, C. S. A. Recovered.
24	Brooks, A., Pt., E, 72d New York, age 21.	July 2, 5, '63.	Right; flap. Discharged February 24, 1864.
25	Brooks, N. M., Capt., C, 12th N. Jersey, age 22.	May 12, June 2, 1864.	Right; flap. Surg. D. W. Bliss, U. S. V. Discharged October 4, 1864. *Spec.* 2429.
26	Brotts, H. A., Corp'l, H, 8th Ohio, age 23.	July 3, 25, '63.	Left; flap. Surg. N. Hayward, 20th Mass. Bone removed. Discharged December 15, 1863.
27	Bullock, S. J., Serg't, A, 108th New York, age 20.	July 3, 6, '63.	Right; circular. Ass't Surg. F. Wolf, 39th N. Y. Sept. 1, rem. necrosed bone. Discharged July 15, 1864. *Spec.* 4370.
28	Burbridge, C., Pt., A, 88th Pennsylvania, age 40.	May 10, 23, '64.	Right; anterior posterior flap. A. A. Surg. P. C. Porter. Disch'd June 27, 1865.
29	Burr, H. C., Pt., K, 8th Connecticut, age 35.	Sept. 17, Oct. 15, 1862.	Right; ant. posterior flap. Surg. G. H. Oliver, 111th Penn. Discharged April 14, 1863.
30	Butler, J., Pt., C, 3d Michigan.	May 3, 6, '63.	Right. Discharged May 1, 1864.
31	Buttinger, C., Corp'l, B, 20th Massachusetts.	June 30, July 4, 1862.	Right. Surgeon M. S. Kittinger, 100th N.Y. Disch'd Sept. 25, '62. Died Oct. 9, '65; consumption.
32	Cadugan, A., Corp'l, I, 116th New York.	July 13, Aug. 10, 1863.	Right; flap. Surg C. B. Hutchins, 116th N. Y. Discharged September 19, 1863.
33	*Caldwell, J. N.*, Pt., K, 3d N. C., age 30.	May 12, 15, '64.	Right; circular. Old Capitol prison October 14, 1864.
34	*Campbell, J.*, Pt., Stewart's La. Scouts, age 32.	Nov. 30, Dec. 7, '64.	Right; circular. Transferred to prison July 22, 1865.
35	Campbell, J. H., Pt., D, 95th Pennsylvania, age 15.	Aug. 21, 28, '64.	Left; lateral flap. A. A. Surg. W. B. Morrison. Disch'd Aug. 7, 1865. Subsequent operation.
36	Carr, C., Pt., E, 26th Pennsylvania.	Aug. 29, Sep. 6, '62.	Left. Discharged February 12, 1863.
37	Caufman, C. E., Pt., K, 1st Penn. Reserves.	June 30, J'y 3, '62.	Right. A. A. Surg. J. Swinburne, Discharged November 3, 1862.
38	Church, G. S., Pt., G, 6th Penn. Reserves.	Dec. 13, 25, '62.	Left; flap. Discharged March 19, 1863. *Spec.* 649.
39	Church, M. F., Pt., B, 16th New York, age 21.	June 27, July 22, 1862.	Left. Ass't Surg. R. Bartholow, U. S. A. Necrosed bone rem'd. Discharged January 11, 1863.
40	Cole, J., Pt., D, 188th Pennsylvania, age 21.	June 3, 22, '64.	Left (June 3, amp. toes; gang.; hæm.); anterior post. flap. A. A. Surg. H. M. Dean. Disch'd August 3, 1864. *Spec.* 2635.
41	Condon, T., Pt, K, 42d Illinois, age 32.	Jan. 1, 15, '63.	Left; circular. Surgeon T. D. Fitch, 42d Illinois. Discharged October 21, 1864. *Spec.* 277.
42	*Cook, M.*, Pt., I, 20th Louisiana, age 23.	April 7, 20, '62.	——; erysipelas. Trans. October 11, 1862, to military prison.
43	Courter, W. C., Pt., F, 43d Ohio, age 23.	Mar. 6, 11, '65.	Left; anterior flap. A. A. Surg. E. L. Mola. Discharged Aug. 8, 1865.
44	Cover, P., Pt., G, 14th Pennsylvania Cavalry, age 26.	Aug. 26, Sept. 23, 1863.	Right; posterior flap. Surg. J. Paddock, 22d Virginia, C. S. A. Discharged May 14, 1865. Died May 24, '65; phthisis pulmonalis.
45	Crawford, E., Pt., F, 105th Ohio, age 20.	Sept. 19, Oct. 4, '63.	Right; ant. post. flap. Surg. W. L. Johnson, 18th Ohio. Aug. 5, 1864, amp. thigh, lower third. Hæm.; ligat'n of profunda. Discharged Mar. 18, '65. *Spec.* 3108.
46	Crawford, T., Pt., I, 8th Michigan.	Sept. 14, 17, '62.	Right; circular. February, 1863, operation 8 ins. below the knee. Discharged February 5, 1863.
47	[1] Cullom, G., Pt., D, 83d Ohio, age 20.	May 16, June 10, 1863.	Left; flap. Aug. 25, rem. necro. bone. Discharged Oct. 19, 1863. Died August 27, 1872; phthisis pulmonalis. *Spec.* 2099.
48	Dallmeyer, F., Lieut., C, 12th Missouri, age 24.	May 22, 26, '63.	Right. Skey's method. A. Surg. H. M. Sprague, U. S. A. Discharged Nov. 14, 1864. Died July 18, 1871. *Spec.* 1627.
49	Devan, R. P., Pt., D, 3d Wisconsin.	Aug. 9, 17, '62.	Left; circular. A. A. Surgeon S. E. Fuller. Discharged October 29, 1862. *Spec.* 54.
50	Dickens, H. S., Pt., H, 126th N. York, age 30.	July 3, 11, '63.	Left; flap. A. A. Surg. S. R. Skillern. April 24, 1864, ant. post. flap amput'n thigh, lower third. Disch'd April 28, '65. *Spec.* 2740.
51	Dietz, W., Serg't, I, 29th New York.	May 2, 10, '63.	Right; circular. Surg. R. Thomain, 29th New York. Discharged June 20, 1863.
52	Dillen, F. M., Pt., H, 7th Wisconsin, age 24.	May 10, 13, '64.	Left; circ. Surg. D. C. Ayres, 7th Wis. Disch'd Oct. 8, 1864.
53	Dotts, J. L., Lieut., D, 54th Penn., age 22.	Sept. 22, Oc. 15, '64.	Right; circ. A. A. Surg. B. B. Miles. Discharged May 14, '65.
54	Dresser, W. M., Pt., G, 35th Mass., age 24.	Sept. 17, 22, '62.	Right; flap. Surg. W. H. Leonard, 51st N. Y. Discharged.
55	Drummond, R. A., Pt., I, 89th Indiana.	April 9, 12, '64.	Right; circ. Discharged April 30, 1865.

312	Lahser, A., Pt., I, 24th Michigan, age 20.	May 23, June 9, 1864.	Right. Surgeon G. L. Pancoast, U. S. V. Died June 18, 1864. *Spec.* 2464.
313	Lannahan, J., Pt., H, 9th N. Y. Heavy Artillery, age 20.	Oct. 19, Nov. 7, 1864.	Left; circular. A. A. Surg. R. H. Stirling. (Gangrene.) Died December 5, 1864; pyæmia.
314	Laveve, D., Pt., F, 5th New York, age 24.	June 2, 19, '64.	Right. A. A. Surg. W. H. Randolph. (Erysipelas.) Died June 27, 1864; asthenia.
315	McClellan, J., Pt., I, 40th Ohio, age 19.	May 15, June 4, 1864.	Left; circular. A. A. Surgeon H. C. May. Sloughing. Died June 23, 1864; exhaustion.
316	McClure, R., Pt., K, 82d Pennsylvania, age 37.	April 1, 17, '65.	Right; circular. A. A. Surg. A. V. Cherbonnier. Died July 3, 1865; dysentery. *Spec.* 4103.
317	McCoy, G., Pt., E, 62d Pennsylvania.	Jan. 23, Feb. 12, 1864.	Left; circular. A. A. Surg. W. F. Peck. Died February 26, 1864; pyæmia.
318	McGeough, M., Lieut., H, 1st Sharpshooters, age 30.	May 7, 17, '64.	Left; circular. A. A. Surg. J. C. McGee. Died May 22, 1864; pyæmia. *Spec.* 2275.
319	McMillen, J., Pt., K, 86th Illinois, age 23.	July 10, 17, '64.	Left; circular. Died August 17, 1864; exhaustion.
320	McMullen, G., Lieut., C, 110th Ohio, age 34.	July 9, 21, '64.	Left; circular. A. A. Surg. J. H. Bartholf. Died Aug. 21, 1864.
321	Madris, J., Pt., C, 33d Indiana, age 35.	July 20, Aug. 13, 1864.	Right; ant. post. flap. Ass't Surg. W. B. Trull, U.S.V. Died Aug. 29, 1864; irritative fever.
322	Magoon, J. B., Pt., A, 33d Mass., age 42.	June 22, July 15, 1864.	Left; ant. post. flap. Ass't Surg. B. E. Fryer, U.S.A. Died July 18, 1864; pyæmia.
323	*Martin, P.*, Pt., F, 18th Louisiana, age 32.	April 7, 16, '62.	——; erysipelas. Died April 25, 1862; mortification of leg.
324	Mayne, R., Pt., K, 6th Vermont, age 20.	May 5, 29, '64.	Right. Surg. Z. E. Bliss, U. S.V. (May 22, rem. of ball and fragments of bone; erysipelas.) Died June 2, 1864.
325	Miller, A. L., Pt., D, 121st New York, age 23.	May 11, 17, '64.	Left flap. A. A. Surgeon W. E. Clark. Died May 23, 1864; pyæmia.
326	Miller, L., Pt., 18th Ohio Battery, age 19.	De.16,'64, Jan. 8,'65.	Right; flap. A. A. Surg. F. G. Albright. Died Jan. 18, 1865.
327	Moore, C., Pt., E, 1st R. I. Light Art'ry, age 38.	May 3, 12, '63.	Left. Died June 30, 1863.
328	Morrison, D., Pt., A, 11th Maine.	May 31, June 29, 1862.	Left. A. A. Surg. F. H. Brown. (Also wound of right femur.) Died July 25, '62; tuberculosis. *Spec.* 13.
329	Mullen, E., Pt., D, 5th N.Y. H'vy Art., age 25.	July 18, 24, '64.	Left; flap. Ass't Surg. J. Willard, 1st Md. Died July 28, 1864.
330	Musser, W., Pt., I, 83d Pennsylvania, age 22.	July 1, 8, '62.	Right; flap. Ass't Surgeon J. S. Billings, U. S. A. Gangrene; diarrhœa. Died July 15, 1862.
331	*Neil, J. P.*, Pt., G, 14th South Carolina, age 18.	April 2, 9, '65.	Left. A. A. Surg. J. M. Hotaling. Died April 20, 1865; diarrhœa.
332	Nicholson, J., Corp'l, C, 40th Penn., age 27.	April 2, 22, '65.	Right; circular. A. Surgeon F. E. Martindale, U. S. V. Died April 24, 1865.
333	Nixon, W., Pt., H, 20th Illinois.	June 17, July 6, 1864.	Right. Surg. G. F. French, U.S.V. (Hæmorrhage); diarrhœa. Died Aug. 19, '64; exh'n. *Spec.* 3382.
334	Norton, A. L., Corp'l, D, 14th Conn., age 29.	June 3, 6, '64.	Left. Died June 29, 1864; pyæmia.
335	O'Harran, P., Pt., A, 52d New York, age 40.	June 16, July 16, 1864.	Left; posterior flap. A. A. Surg. E. Seyffarth. Gangrene. Died July 25, 1864; pyæmia.
336	Parry, W., Pt., B, 5th Mich. Cavalry, age 33.	May 28, J'ne 6,'64.	Left. A. A. Surg. J. H. Thompson. Died June 15, 1864; pyæmia.
337	*Parsons, B. F.*, Lieut., G, 4th Georgia, age 22.	July 13, 18, '64.	Right. A. A. Surg. N. A. Robbins. Died July 30, 1864.
338	Patterson, A., Pt., K, 4th Maine, age 35.	Oct. 28, Nov. 13, 1861.	Left; circular. Ass't Surg. W. Thomson, U. S. A. Died Nov. 19, 1861; gangrene. *Spec.* 4926.
339	*Peed, J.*, Pt., A, 16th Kentucky, age 28.	Nov. 30, Dec. 15, 1864.	Left; circular. Surg. J. R. Ludlow, U. S. V. Died January 8, 1865; pyæmia.
340	Perkins, A. W., Pt., E, 11th Infantry, age 40.	May 8, 24, '64.	Left; circular. Ass't Surg. W. F. Norris, U.S.A. Hæmorrhage. Died June 1, 1864; pyæmia.
341	Piper, E. C., Serg't, K, 12th New Hampshire, age 28.	June 3, 29, '64.	Left; ant. post. flap. A. A. Surg. L. C. Dodge. Died August 8, 1864; chr. diarrhœa. *Spec.* 2715.
342	Pittman, N., Pt., D, 1st Massachusetts Heavy Artillery, age 32.	May 19, June 10, 1864.	Left; circular. A. A. Surgs. H. B. Knowles and M. F. Price. Died June 14, 1864; pyæmia.
343	Pitzel, A., Pt., E, 34th Ohio.	Sept. 10, 14, '62.	Left. Died September 16, 1862; tetanus.
344	*Pressgraves, J. R.*, Lieut., 8th Virginia.	July 2, 13, '63.	Left. Surgeon C. S. Wood, 66th New York. Died July 15, 1863; tetanus.
345	Reynolds, W., Corp'l, I, 6th N.Y. H. A., age 32.	May 31, J'e 15,'64.	Left. A. A. Surg. J. H. Thompson. Died July 6, 1864; pyæmia.
346	Ross, W. A., Pt., I. 123d Pennsylvania, age 18.	Dec. 13, 18, '62.	Right. Died January 4, 1863; diarrhœa. *Spec.* 677.
347	Schuler, C., Corp'l, C, 71st New York, age 23.	July 2, 13, '63.	Left; hæmorrhage. Died July 21, 1863; hæmorrhage.
348	Scott, E., Pt., G, 25th Ohio, age 18.	Nov. 30, Dec. 4, 1864.	Left; anterior posterior flap. A. A. Surgeon W. Balser. Died December 28, 1864; hectic fever.
349	Sharp, W., Pt., I, 8th N. York Heavy Artillery, age 21.	June 3, 7, '64.	Left; anterior flaps. Surg. F. F. Burmeister, 69th Penn. (Hæm.) Died July 12, 1864. *Spec.* 3204.
350	Sieker, H., Pt., K, 35th Ohio.	Sept. 19, 22, '63.	Left; sloughing. Died October 16, 1863.
351 152	Smith, P., Serg't, K, 69th New York, age 30.	Aug. 16, Sept. 6, 1864.	Both; circular. A. A. Surgeon J. H. Hutchinson. Sloughing; bed-sores. Died October 10, 1864; exhaustion. *Spec.* 3644.
353	Spiller, J. F., Corp'l, I, 7th New Hampshire, age 21.	Feb. 11, Mar. 6, 1865.	Right; lateral flap. A. A. Surg. B. B. Miles. Died March 13, 1865; pyæmia.
354	Steele, G. A., Serg't, K, 1st New Hamp. Cav.	Oct. 6, 9, '64.	Right; circular. Died November 12, 1864; gangrene.
355	Stilwell, C., Pt., K, 57th New York.	Sept. 17, Oct. 3,'62.	Left. Surg. H. S. Hewit, U. S.V. Died October 9, 1862. *Spec.* 762.
356	Temple, A., Serg't, F, 1st Missouri Cavalry, age 24.	Aug. 21, Sept. 6, 1864.	Right; circular. A. A. Surgeon C. A. Warner. Died September 20, 1864; pyæmia.
357	[3] Tillapaugh, G. W., Corporal, B, 151st N. Y., age 23.	May 31, June 6, 1864.	Right; circular. A. A. Surgeon C. H. Osborne. Died June 21, 1864; pyæmia.
358	Umbarger, J. W., Corp'l, I, 117th Illinois, age 30.	Dec. 5, 1864, Jan. 12, 1865.	Left. A. A. Surgeon H. M. Lilly. (Dec. 15, 1864, Chopart's amp. foot; gangrene.) Died January 14, 1865; pyæmia.
359	Vangeson, J., Corp'l, F, 4th Artillery, age 35.	Aug. 16, 23, '64.	Left; circular. A. A. Surg. S. J. Holley. Died September 2, '64; exhaustion.
360	Van Scoter, G., Pt., G, 5th New York.	Aug. 29, '62. Int.	Left. Died October 12, 1862.
361	Velie, G. W., Pt., C, 24th Michigan, age 28.	June 3, 28, '64.	Right; circular. Surgeon D. W. Bliss, U. S.V. (Excision ankle.) Gangrene. Died July 18, 1864.
362	White, A. J., Pt., A, 8th New York Heavy Artillery.	June 3, 9, '64.	Left; rectangular flap. Surg. E. Bentley, U.S.V. Flaps sloughed. Died July 10, 1864; exhaustion. *Specs.* 2497, 3340.
363	*Williamson, H.*, Pt., D, 11th Miss., age 20.	July 2, 5, '63.	Right; sloughing. Died February 18, 1864.
364	Witzel, J., Serg't, I, 1st Maryland, age 24.	Aug. 19, 22, '64.	Right; circular flap. Surg. A. A. White, 8th Maryland. Died September 16, 1864.
365	Wood, F., Serg't, A, 5th Michigan Cavalry, age 22.	Oct. 19, Nov. 7, 1864.	Right; anterior post. flap. Ass't Surgeon D. C. Peters, U. S. A. Died Nov. 18, 1864; pyæmia.
366	*Woolten, T.*, Pt., F, 32d Virginia.	Mar. 10, 14, '64.	——; flap. Surgeon C. B. Gibson, C. S. A. Died May 19, 1864.
367	Wright, B., Pt., G, 8th Michigan, age 23.	May 6, 27, '64.	Right; anterior post. skin flap. Surgeon A. F. Sheldon, U. S. V. Died June 11, 1864; exhaustion and typhoid condition.
368	Yagle, J. F., Pt., E, 87th Indiana, age 23.	Sept. 20, Oct. 5, 1863.	Left; circular (gangrene). Died October 14, 1863.

[1] Lidell (J. A.), *On the Wounds of Blood Vessels, etc.*, in *United States Sanitary Commission Memoirs*, New York, 1870, Surgical Vol. I, p. 23.

[2] Packard (John H.), *Death from Chloroform*, in *American Journal Medical Sciences*, 1865, Vol. XLIX, N. S., p. 272.

[3] Lidell (J. A.) (*Secondary Traumatic Lesions of Bone, etc.*, in *U. S. San. Comm. Mem.*. Surg. Vol. I, N. Y., 1870, p. 408) cites this case as an amputation in the thigh; but in his report of cases of pyæmia, at Stanton Hospital, for the second quarter, 1864, he designates the operation an amputation in the leg.

Intermediary Amputations in the Lower Third of the Leg for Shot Injury.—The number of the intermediary amputations in the lower third of the leg is three hundred and thirty-five; two hundred and fifteen were successful and one hundred and twenty fatal—a mortality of 35.8 per cent.

Recoveries after Intermediary Amputation in the Lower Third of the Leg.—The two hundred and fifteen operations of this group were performed on two hundred and fourteen patients—fifty Confederate and one hundred and sixty-four Union soldiers. Of the latter, one hundred and sixty-two have been allowed pensions; the claim of one soldier is still pending, and the name of another has never appeared on the Pension Rolls. Twelve have died since their discharge from the service—three of phthisis, one of softening of the brain, one of ulceration of the stump, six of causes not reported; one pensioner was accidentally drowned.

CASE 771.—Private O. Payne, Co. D, 20th Colored Troops, aged 19 years, was wounded in the right foot, near Petersburg, June 7, 1864, and entered Mount Pleasant Hospital, at Washington, three days afterwards. Assistant Surgeon C. A. McCall, U. S. A., reported: "Accidental gunshot wound through tendo-achillis, passing through the ankle joint and emerging almost at right angle with the line of entrance, literally grinding the astragalus and part of the os calcis. Sanguineous fluid was discharged from the wounds, and the foot became somewhat œdematous as far as above the malleoli. Two weeks after the patient's admission his pulse grew weaker, more compressible, and frequent, which was attended by loss of appetite and sleep. On June 27th, an anæsthetic consisting of equal parts of ether and chloroform was administered, and the leg was amputated by the circular method, by Acting Assistant Surgeon A. Transue, the bone being divided one and a half inches above the malleoli. The patient reacted finely, and after the operation his appetite improved, he slept well, and the parts looked favorable." On October 8th, he was transferred to hospital at New Albany, where a second operation was performed by Acting Assistant Surgeon W. A. Clapp, who contributed the following description of the case: "The patient stated that he contracted syphilis previous to being wounded. Extensive necrosis of the shafts of the tibia and fibula followed the first amputation, and the pain and discharge from the stump became so great as to necessitate a re-amputation, which was performed by the circular method, three inches below the knee, on March 18, 1865. At the time of the operation firm sequestra had formed and there was great swelling of the soft parts. The subsequent progress was favorable." The patient was ultimately discharged from service, at the Joe Holt Hospital, Jeffersonville, August 1, 1865, and pensioned, and one year afterwards he was furnished with an artificial limb of the Palmer patent. The bones removed at the second amputation were subsequently contributed to the Museum by Dr. T. W. Fry, late Surgeon U. S. V., who at the same time stated that the man was in good health and walking about on crutches, with a good stump, which had healed kindly. The specimen is numbered 4740 of the Surgical Section, and is represented in PLATE LXXII, FIGURE 1, opposite page 317, *ante*. The pensioner was paid March 4, 1880.

FIG. 305.—Lower extremities of bones of left leg; the ball lodged in tibia. *Spec.* 4054.

CASE 772.—Private L. Vermilyea, Co. K, 91st New York, aged 21 years, was wounded at Gravelly Run, March 31, 1865. He was conveyed to the field hospital of the 3d division, Fifth Corps, whence Surgeon A. S. Coe, 147th New York, reported "a bullet wound with fracture of left ankle joint." Surgeon A. F. Sheldon, U. S. V., reported the following description and result of the injury: "A musket ball entered the lower extremity of the tibia anteriorly, fracturing it into the joint and upwards for four inches. The wounded man was admitted to Campbell Hospital at Washington, six days after the injury. Suppuration set in about the wounded foot and extended to the muscle of the calf and the patient suffered considerable fever and irritation of the system. On April 11th, circular amputation of the lower third of the leg was performed by Assistant Surgeon A. Delany, U. S. V., the operation being attended with the usual amount of hæmorrhage and three ligatures being applied. Anæsthesia was produced by sulphuric ether. The patient did well after the operation, and was discharged from service June 19, 1865." Several months later he was furnished with an artificial limb by the Salem Leg Company. The amputated portions of the bones of the leg (*Spec.* 4054) were contributed to the Museum by the operator and are represented in the annexed wood-cut (FIG. 305), showing the tibia to be fractured by a round ball, which is lodged just above the ankle, fissuring into it. In his first application for commutation, dated 1870, the pensioner represented the stump as being in a sound condition, but in subsequent statements he reported it as troublesome. The Albany Examining Board, on February 5th, 1879, certified to the amputation, and stated that "the stump is tender and abscesses occasionally form on the posterior aspect of the leg, more especially if an artificial limb is worn for a few weeks at a time. The pensioner also states that he has neuralgic pains and is now and then laid up for from one to three weeks." The pensioner was paid June 4, 1880.

CASE 773.—Private T. B. Stewart, Co. C, 2d Connecticut Heavy Artillery, aged 31 years, was wounded, at Opequan Creek, September 19, 1864, and admitted to the Depot Field Hospital at Winchester three days afterwards. Surgeon R. Sharpe, 15th New Jersey, in charge, recorded the following history: "The injury consisted of a shot wound of both feet by a shell, severely fracturing and comminuting all the tarsal bones. On September 23d the right leg was amputated, and on the following day the left leg was amputated, both by circular operation, at the lower third, by Assistant Surgeon J. G. Thompson, 77th New York. Severe sloughing of the stumps followed, and on October 2d there was secondary hæmorrhage from the interosseous artery of the left leg, which was controlled by taking up the vessel with the forceps. The patient recovered and was transferred from Winchester November 8th." He was subsequently admitted to hospital at Frederick, and lastly he entered Central Park Hospital at New York City, where he was furnished with artificial legs by Dr. E. D. Hudson. On August 13, 1865,

the man was discharged from service and pensioned. In his application for commutation, dated 1870, he described both stumps as being in "sound condition;" but five years later he reported that "the bones stick out." The pensioner was paid March 4, 1880.

CASE 774.—Private G. Morgan, Co. E, 97th New York, aged 30 years, was wounded in the left ankle joint, at Hatcher's Run, February 6, 1865. Assistant Surgeon D. C. Peters, U. S. A., reported: "The wounded man was admitted to Jarvis Hospital, Baltimore, February 11th. The injury was caused by a musket ball entering the external malleolus, fracturing the astragalus, and making its exit internally. Caries of the astragalus ensued and the foot became greatly inflamed. On March 2d, the leg was amputated at the lower third by Acting Assistant Surgeon B. B. Miles. Ether was used, and the operation was performed by lateral flaps with circular section of muscles." The patient was subsequently transferred to Ira Harris Hospital at Albany, where he was discharged from service October 13, 1865, and pensioned. A plaster cast of the stump (*Spec.* 1025), represented in the annexed cut (FIG. 306), was contributed to the Museum by Assistant Surgeon J. H. Armsby, U. S. V., in charge of the latter hospital, and shows the ends of the bone apparently rounded and sufficiently covered, while the cicatrix is slightly but not injuriously drawn on the posterior surface. In his application for commutation the pensioner described the stump as continuing in a "healthy condition." His pension was paid June 4, 1880.

FIG. 306.—Stump after flap amputation in lower third of the left leg. [From a cast.] *Spec.* 1025.

CASE 775.—E. Robinson, a landsman (colored), aged 24 years, while attached to the U. S. Steamer Rodolph, was wounded in the left leg by the explosion of a torpedo in Mobile Bay, April 1, 1865. The injury involved a dislocation of the tibia at the knee and a compound comminuted fracture of the fibula and tibia near the ankle of the same leg. The fracture was impacted as well as comminuted. When he was admitted to the Naval Hospital at Pensacola, three days afterwards, the dislocation had been reduced, but on examination (the patient being under the influence of chloroform) both the tibia and fibula were found to be severely injured near the ankle, the bones protruding from the wound and large and small fragments being easily felt by introducing the finger. It was then deemed useless to attempt to save the limb, and amputation was performed about four inches above the injury. The dislocated bone was kept in position by pasteboard splints and the greatest care was used in dressing the stump. The case progressed favorably until April 22d, when the patient complained of headache and nausea, followed in a short time by a severe chill and high fever. Pyæmia being apprehended, the stump, though nearly healed at the time, was carefully examined, and fluctuation was detected at the under portion near the cicatrix. After the escape of pus by free incision into this part the patient, who was a man of strong constitution, over six feet high and stout in proportion, improved rapidly under the administration of quinine, and was soon able to be transferred to New York, where he entered the Naval Hospital on June 15th. He was discharged from service November 24, 1865, with a good stump, being able to walk easily and well on an artificial limb and suffering no weakness of the knee consequent upon the dislocation. The history was contributed by Passed Assistant Surgeon J. R. Tryon, U. S. N., who also forwarded the amputated bones of the leg, which constitute specimen 5662 of the Surgical Section of the Museum, and exhibit the seat of the injury, including a longitudinal fissure in the tibia about three inches in length. The man is a pensioner and was paid September 4, 1880. He reported the stump as continuing in "good and healthy condition."

CASE 776.—Private O. M. Armstrong, Co. B, 120th New York, aged 33 years, was wounded at Cold Harbor, June 3, 1864. Surgeon F. F. Burmeister, 69th Pennsylvania, reported his admission to the Second Corps Hospital, at White House, with "shot wound of left ankle joint, for which amputation was performed by Dr. Henry McLean, of Troy, N. Y., on June 10th." Two days afterwards the patient entered Armory Square Hospital, Washington, where a subsequent operation was performed by Surgeon D. W. Bliss, U. S. V., who described the case as follows: "The man was admitted with amputation of the leg at the lower third. The stump was very painful and symptoms of necrosis were exhibited. Simple dressings were used, and stimulants and nourishing diet were prescribed. On October 11th, the patient was placed upon the operating table and put under the influence of chloroform, when the stump was opened and a ring of necrosed bone, which encircled the tibia, was taken away by means of a pair of dressing forceps. The patient did well after the operation, and was transferred to hospital at Rochester in February following." The removed fragment, consisting of a tubular sequestrum four inches long, was contributed to the Museum by the operator (*Cat. Surg. Sect.*, 1866, p. 404, *Spec.* 3284), and is represented on PLATE LXXI, FIGURE 3, opposite page 428, *ante*. The patient was discharged from service May 31, 1865, and pensioned, having been previously supplied with an artificial limb by Dr. D. Bly, who described the amputation as having been performed by the flap method. The pensioner died October 22, 1870. The cause of his death is reported to have been softening of the brain.

Fatal Intermediary Amputations in the Lower Third of the Leg.—One hundred and twenty amputations—one hundred and three performed on Union and seventeen on Confederate soldiers—belong to this category. In two instances amputation in the lower third of the thigh was unavailingly resorted to. Death was ascribed to pyæmia in thirty-five, exhaustion in twenty, tetanus in five, gangrene in three, and secondary hæmorrhage in four instances.

CASE 777.—Private L. Mock, Co. I, 119th Pennsylvania, aged 22 years, was wounded in the left foot, at Rappahannock Station, November 7, 1863, by a musket ball, which entered about one and a half inches below the internal malleolus, passing upward and outward, making its exit anterior and under the external malleolus and opening the ankle joint in its passage through the parts. He entered Armory Square Hospital at Washington two days after receiving the injury. On December 6th, Surgeon D. W. Bliss, U. S. V., amputated the leg above the ankle by flap operation, the patient being under ether, to

which a little chloroform was added towards the last. Three vessels were ligated, the loss of blood being small. The patient reacted well from the anæsthetic. At the time of the operation his constitutional condition was tolerably good and the tissues of the wounded parts were in a healthy state. The stump grew painful, but its appearance was good. Cold-water dressing was used and nourishing diet with stimulants were administered. On December 9th the patient had three chills, followed by profuse perspiration. On the following day there was no chill, the stump still looked well, and the patient suffered no pain. Quinine and opium were now prescribed in addition to the former treatment. By December 18th there was well-developed pyæmia, from the effects of which the patient died December 21, 1863. After death yellowness, to an extreme degree, came on, and, on inspection, the shoulder and elbow were found to contain pus, the shoulder having a large quantity and the other joints being believed to be in a like condition. The tarsal bones of the amputated limb, contributed with the history by the operator, constitute specimen 1903 of the Surgical Section of the Museum. The specimen exhibits no perceptible attempt at repair, and shows that the ball passed through the calcaneum, which is necrosed, and grazed the astragalus, opening the ankle joint. The appearance of the entrance and exit wounds is shown in PLATE XXXIX, FIGURE 2.

CASE 778.—Corporal G. B. Scott, Co. K, 8th New York Cavalry, aged 19 years, was wounded in the right lower extremity, at Beverly Ford, June 9, 1863. He was conveyed to Washington and admitted to Lincoln Hospital on the following day, whence Surgeon G. S. Palmer, U. S. V., contributed the pathological specimen (No. 1347) represented in the adjoining wood-cut (FIG. 307), with the following description and result of the injury: "The wound was of the right ankle joint, affecting the internal malleolus and bones of the foot. The ball entered over the inner malleolus and was not extracted. Incisions with the knife were made over the external malleolus, allowing the free flow of pus, and fragments of bone were daily extracted. The leg was amputated at the lower third on June 20th. The patient never recovered from the shock of the operation. On the second day he had a severe chill, followed by profuse sweating. His tongue became dry and he complained of great thirst; pulse 130; appetite capricious. The flaps of the stump grew whitish around the ligatures, and a watery offensive discharge commenced to escape from the stump. On the third day the anterior flap became tawny, having a decided tendency to slough, and the limb became decidedly erysipelatous. On June 24th, profuse diarrhœa set in and the patient complained of pain in the loins, but his mind was yet clear and he was in excellent spirits. The stump now had no sensation in it whatever. The chills followed each other in rapid succession, the patient having as many as two daily, followed in each case by diaphoresis. He rested well until the evening of June 29th. On the following day twenty-five drops of laudanum were administered, which produced a quiet slumber. On awakening from this he became delirious and very restless; pulse 183 and compressible; respiration thirty-five per minute and labored; fever intense. He died on the morning of July 1, 1863. The wound at no time discharged purulent matter, but profuse, thin, and offensive fluid, staining the dressings with a dirty blood color. The flaps retained their proper relations, the ligatures not loosening. No erysipelas existed beyond the knee, which was slightly swollen. At the *post-mortem* examination the stump was found to have become blackened, the epidermis being readily detached from its base, and a large bleb full of brownish serum was discovered on the inner side of the knee. The anterior flap was perfectly black, and the muscles in the posterior flap had become a softened pultaceous mass. The periosteum of the fibula was detached and of a dark green color; the muscles were affected as far up as the union of the tibia and fibula. The anterior portion of the fibula and the crest of the tibia were dotted with a reddish color, the rest of the bones being pure white." The specimen consists of the amputated lower extremities of the bones of the leg, the external malleolus being broken off.

FIG. 307.—The lower portions of the bones of right leg. *Spec.* 1347.

CASE 779.—Sergeant *W. H. Gaskins*, Co. K, 8th Virginia, aged 20 years, was wounded and captured at Gettysburg, July 3, 1863. His injury was described by Assistant Surgeon W. F. Richardson, C. S. A., from Camp Letterman, as follows: "A minié ball entered the centre of the sole of the right foot, passing through the tarsus and emerging at the top of the foot. The leg was amputated at the lower third on August 1st. The patient was troubled with abscesses which formed in the stump, and now and then attacks of diarrhœa came on, which brought his condition down. Astringents, nourishing diet, tonics, and stimulants were administered. In the beginning of September the discharge had grown very slight; but about October 20th the stump became much swollen and inflamed, the discharge copious and unhealthy, and the tibia protruded one-half inch, the bone being necrosed for six inches above the end of the stump. Diarrhœa was now profuse and obstinate. By October 30th the patient had become much reduced and the necrosed portion of the tibia was loose. On November 4th the diseased portion of the bone, six inches in length, was removed. The patient died on the following day, November 5, 1863." A section of the bones of the stump (*Spec.* 1962), showing very extended ravages of disease, was contributed by Acting Assistant Surgeon E. P. Townsend and is represented in the wood-cut (FIG. 308).

FIG. 308.—Sections of right tibia and fibula, three months after amputation in lower third. *Spec.* 1962.

CASE 780.—Private L. Smith, Co. D, 12th Infantry, aged 24 years, was wounded in the left foot, at Spottsylvania, May 12, 1864, and entered Stanton Hospital, Washington, six days afterwards. Surgeon J. A. Lidell, U. S. V., reported: "The nature of the injury was an extensive shell wound on the plantar surface, all the tarsal bones except the cuboid being fractured. The foot became much swollen and inflamed and the wound was sloughing and full of maggots. Acting Assistant Surgeon C. H. Osborn amputated the leg at the lower third, on May 21st, by the circular method, using sulphuric ether as the anæsthetic. But little blood was lost during the operation. The patient reacted promptly and did not suffer much shock. Tonics and stimulants were administered. On May 26th, there was a pyæmic chill, which returned at intervals for two weeks. The stump commenced to slough, abscesses formed in the thigh, and large bed-sores came on over the sacrum. The patient was also troubled with diarrhœa. Death resulted from pyæmia July 3, 1864. At the autopsy the anterior part of the stump was found to have sloughed to within one inch below the tubercle of the tibia, exposing the bone, which was denuded of its periosteum. There were two large abscesses, one in the popliteal space and the other in the middle third of the thigh; small thrombi in the veins. The lungs

contained several superficial abscesses; the liver was enlarged, soft, and fatty; spleen soft and enlarged. All the other viscera were in a normal condition." The stump of the leg, showing the tibia to be exposed for the extent of six inches, was contributed to the Museum by Assistant Surgeon G. A. Mursick, U. S. V., and constitutes specimen 2739 of the Surgical Section.

TABLE LXXIV.

Summary of Three Hundred and Thirty-five Cases of Intermediary Amputations in the Lower Third of the Leg for Shot Injury.

[Recoveries, 1—215; Deaths, 216—335.]

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Adams, S. N., Pt., D, 110th Ohio, age 29.	April 2, 12, '65.	Right; flap. A. A. Surg. F. H. Colton. (Also fracture and exc. left tibia.) Disch'd Sept. 11,'65.
2	Agan, H., Pt., I, 7th Michigan, age 17.	Sept. 17, 24, '62.	Right; circular. S. G. Gray, Acting Medical Cadet, U. S. A. Discharged June 6, 1863.
3	Anderson, R., Pt., H, 76th Colored Troops, age 25.	April 12, 20, '65.	Left; ant. post. skin flap; circular section muscles. Surgeon F. E. Piquette, 86th Colored Troops. Discharged June 10, 1865.
4	Armstrong, O. M., Pt., B, 120th N. York, age 33.	June 3, 10, '64.	Left; flap. Dr. H. McLean, Troy. Necrosis; sequestra removed. Disch'd May 31, 1865. *Spec.* 3284. Died October 22, 1870; softening of brain.
5	Babcock, E. G., Pt., I, 34th Mass., age 27.	June 18, July2,'64.	Left; flap. Confederate surgeon. Discharged July 6, 1865.
6	Bachtell, S., Pt., H, 7th Pennsylvania Cavalry, age 22.	Aug. 18, Sept. 17, 1864.	Right; circular. A. Surg. T. A. McGraw, U. S. V. Disch'd Jan. 30, 1866; subsequently re-amp.
7	*Bacon, A.*, Pt., B. 2d S. Carolina, age 21.	July 2, 26, '63.	Left; circular. Surg. S. Baruch, 3d Battalion, S. C. To Provost Marshal September 17, 1863.
8	Bacon, W., Pt., D, 7th Maine, age 21.	July 12, 15, '64.	Left; circular. A. A. Surg. T. Carroll. Necrosis. Discharged June 16, 1865. Amputation thigh in 1866. *Spec.* 2841.
9	Barnett, J. B., Pt., E, 191st Penn., age 33.	Mar. 31, April 8, 1865.	Left; ant. post. flap. Surgeon N. R. Moseley, U. S. V. (April 1, Syme's amp. ankle joint; sloughing.) Disch'd June 28, 1865.
10	Bathurst, J. F., Serg't, I, 5th Pennsylvania Reserves, age 23.	Dec. 13, 28, '62.	Left; circular. A. A. Surg. D. Weisel. Gangrene; exfoliat'n. Discharged December 19, 1863.
11	*Betty, W. M.*, Pt., K, 7th Arkansas.	Sept. 19, 28, '63.	Right. Surg. P. F. Eve, C. S. A. Recovery.
12	*Biglow, I.*, Pt., E, 8th Louisiana.	Sept. 17, 20, '63.	——. Union surgeon. Recovery.
13	Bisbee, A., Corp'l, B, 7th Maine, age 25.	April 16, May 12, 1862.	Right; circular. Surgeon R. B. Bontecou, U. S. V. Discharged February 10, 1863. April 8, 1863, amputation thigh.
14	*Blankenship, W. A.*, Capt., F, 25th Virginia, age 21.	July 2, 9, '63.	Right. Ass't Surg. W. Black, C. S. A. Exchanged Dec. 5, 1863.
15	Boardwell, I., Pt., C, 36th Wisconsin, age 18.	June 6, 19, '64.	Left; double flap. Ass't Surg. S. B. Ward, U. S. V. Disch'd May 4, 1865.
16	*Bowles, R. A.*, Pt., H, 22d Virginia Battery.	June 28, July3,'62.	——. Surg. —Peticolas, C. S. A. Recovery.
17	Brady, B., Pt., E, 73d Ohio, age 21.	May 15, June 5, 1864.	Left; circular. A. A. Surg. C. S. Merrill. Erysipelas. Disch'd February 28, 1865.
18	Brennan, W. D., Capt., A, 142d New York, age 24.	Sept. 29, Oct. 19, 1864.	Left; circular. Surg. D. G. Rush, 101st Penn. Discharged May 15, 1865.
19	Bromley, W., Pt., A, 149th N. York, age 33.	May 6, 13, '64.	Left; circular. Discharged May 25, 1865.
20	*Brown, A. T.*, Pt., B, 43d North Carolina.	Oct. 19, 25, '64.	——. Surgeon R. T. Baldwin, C. S. A. Recovery.
21	Brown, C. F., Pt., F, 1st Connecticut Cavalry, age 24.	June 20, July 3, 1864.	Left; circular. Surg. A. F. Sheldon, U. S. V. Disch'd March 26, 1865. March, 1868, re-amputation. *Specs.* 2765, 4700.
22	Brown, J. C., Pt., E, 52d Ohio, age 20.	July 21, Aug. 6, 1864.	Right; skin flap. A. A. Surg. S. W. Blackwood. April 22, 1865, re-amp. leg. Disch'd June 3, '65.
23	Brown, J. D., Pt., I, 109th New York, age 19.	Nov. 3, 6, '63.	Left; circular. Surgeon D. W. Bliss, U. S. V. Disch'd March 27, 1864. *Spec.* 1764.
24	Brown, S., Pt., I, 107th Ohio, age 21.	July 2, 5, '63.	Right; circular. Discharged February 7, 1864.
25	*Brown, W. A.*, Pt., F, 38th Alabama.	Nov. 25, Dec. 5, 1863.	Left; flap. Surg. J. C. Morgan, 29th Mo. (Also wound of right leg.) Transferred.
26	*Buist, C. B.*, Pt., C, 27th South Carolina.	June 16, 23, '62.	——. Surg. H. Iluger, P.A.C. S. Recovery.
27	Burke, J., Serg't, H, 7th N. Y. H'vy Art., age 21.	June 16, 28, '64.	Left; necrosis. July 16, re-amp. Disch'd Mar. 3, '65. *Spec.* 2880.
28	Bush, H., Pt., D, 85th Pennsylvania, age 33	Aug. 29, Sept. 1, 1863.	Left; circular. Surg. D. Merritt, 55th Penn. Sloughing; erysipelas. Discharged July 6, 1864.
29	Bush, J., Pt., B, 54th Indiana.	May 31, June 3, 1863.	Left; flap. A. A. Surgeon M. B. Graff. Trans. July 24, 1863. Died Jan. 14, 1870; ulceration of stump. *Spec.* 1629.
30	*Carver, S.*, Pt., G, 45th North Carolina.	May 5, 8, '64.	Left. Surg. J. B. Edelin, C. S. A. Discharged March 4, 1865.
31	Clark, R. A., Pt., F, 14th New Jersey, age 21.	July 9, Aug. 3, 1864.	Left; circ. A. A. Surgeon J. C. Shimer. (Also penetr. wound of lung.) Discharged September 11, 1865. *Spec.* 3922.
32	Cluck, J., Pt., B, 7th Penn. Reserves, age 30.	Dec. 13, 28, '62.	Left; circular. Surg. H. Bryant, U. S. V. (Also w'nd of hand and back.) Discharged December 11, 1863. *Spec.* 4548.
33	Conklin, J. H., Pt., A, 40th New York, age 22.	May 5, 8, '64.	Left; circular. Discharged May 15, 1865.
34	Conroy, J., Pt., C, 4th Infantry.	Aug. 30, Sept. 4, 1862.	Right; flap. A. A. Surg. F. H. Brown. Aug. 9, '63, bone rem.; gangrene. Discharged.
35	Coombs, L. D., Corp'l, F, 2d Wisconsin, age 28.	May 5, 15, '64.	Right; anterior posterior flap. Surg. E. Bentley, U. S. V. Discharged December 22, 1864.
36	Corey, R., Pt., C, 18th Connecticut, age 34.	July 18, 28, '64.	Left; circular. A. A. Surgeon J. Goldsborough. Disch'd March 23, 1865.
37	Crocker, N. C., Pt., A, 11th Maine, age 28.	Aug. 14, 25, '64.	Right; circular. A. A. Surgeon R. O. Sidney. Discharged June 12, 1865.
38	Cruger, E., Pt., E, 5th New York.	Aug. 30, Se.20,'62.	Right. Discharged February 11, 1863.
39	Curtis, H. H., Pt., C, 7th Wisconsin, age 22.	May 5, 31, '64.	Left; circ. Confederate surgeon. Discharged May 26, 1865.
40	Curtis, J. B., Pt., I, 8th New York Artillery, age 21.	June 3, 14, '64.	Left; circular. A. A. Surg. A. N. K. Andrews. Sloughing. Discharged November 10, 1864. *Spec.* 2533.
41	Davidson, S., Pt., B, 7th Indiana, age 23.	June 9, 13, '62.	Right; circ. Surg. P. F. Whitehead, C. S. A. Discharged October 3, 1862.
42	Dayton, B. F., Pt., B, 57th Mass., age 18.	May 12, 27, '64.	Left; circular. Surg. O. A. Judson, U. S. V. August, 1864, re-amp. Disch'd Dec. 27, 1864.
43	Denniston, J. F., Capt. and Commissary, U. S. V., age 24.	Aug. 25, Sept. 10, 1864.	Right; circular. Surgeon D. W. Bliss, U. S. V. (Aug. 25, Pirogoff's amp. ankle joint.) Disch'd January 1, 1867. *Spec.* 3211.
44	Dersam, F. E., Pt., H, 8th New York Heavy Artillery, age 31.	June 3, 9, '64.	Right; ant. posterior flap. Ass't Surg. S. B. Ward, U. S. V. Discharged Sept. 13,'65. *Spec.* 2664.

271	Knowles, A. J., Corp'l, M, 1st Maine Heavy Artillery, age 34.	June 18, July 10, 1864.	Right; circular. A. A. Surgeon M. L. Baxter. Died July 17, 1864; exhaustion. *Spec.* 2829.
272	Kurtz, F. E., Serg't, G, 159th N. York, age 22.	Aug. 25, 28, '64.	Right; circ. Surg. Z. E. Bliss, U. S. V. Died April 28, 1865.
273	Lake, J., Pt., D, 6th N. York Heavy Artillery, age 40.	May 19, June 18, 1864.	Right; ant. post. skin flap. Ass't Surgeon W. Thomson, U. S. A. Died July 11, 1864. *Spec.* 3565.
274	Lance, S., Pt., I, 29th Missouri.	De.29,'62, Jan. 19, 1863.	Right. Died January 23, 1863. *Spec.* 1031.
275	Linekin, J. F., Pt., K, 20th Maine, age 17.	May 5, 8, '64.	Left; ant. post. flap. Died June 19, 1864; exh'n and privation.
276	Ling, C. B., Pt., B, 56th Pennsylvania.	July 1, 16, '63.	Right. Died July 18, 1863.
277	Long, T., Pt., H, 37th Wisconsin, age 34.	June 18, J'y 2, '64.	Left; flap. Surg. T. R. Crosby, U. S. V. Died July 7, 1864; exhaustion.
278	McCawley, S. E., Pt., H, 28th Iowa, age 19.	Oct. 19, Nov. 7, 1864.	Right; circ. A. A. Surg. E. R. Fell. (Necrosis); hæmorrhage. Nov. 11, ligation anterior tibial. Died Nov. 19, '64; hæmorrhage.
279	McCleary, A. P., Pt., B, 63d Penn., age 25.	July 2, 8, '63.	Right. Died November 7, 1863.
280	McClure, R. C., Pt., H, 29th Iowa.	April 30, May 3,'64.	Right. Died May 22, 1864.
281	*McGilton, J. F.*, Pt., G, 6th Texas, age 18.	Nov. 30, Dec. 26, 1864.	Right; circular. A. A. Surgeon L. Sinclair. Died February 6, 1865.
282	[1]Minamom, J. G., Pt., L, 1st New York Artillery, age 23.	May 18, 21, '64.	Left; double ant. posterior flap. Ass't Surg. G. A. Mursick, U. S. V. Died June 8, 1864; pyæmic pneumonia. *Spec.* 2494.
283	Mitchell, T., Pt., C, 36th Indiana.	Sept. 19, Oct. 7, 1863.	Left; flap. A. A. Surgeon J. A. Romayne. (Gangrene.) Died October 15, 1863; pyæmia.
284	Mock, L., Pt., I, 119th Pennsylvania, age 22.	Nov. 7, Dec. 6, 1863.	Left; flap. Surgeon D. W. Bliss, U. S. V. (Necrosis.) Died Dec. 21, 1863; pyæmia. *Spec.* 1903.
285	Morrison, S., Corp'l, D, 81st New York, age 24.	June 3, 27, '64.	Left. Died July 26, 1864; pyæmia.
286	*Moulton, B.*, Pt., H, Gordon's Cavalry, age 28.	Oct. 20, 31, '64.	Right; flap. Surg. G. W. Hogeboom, U. S. V. Gangrene. Died Nov. 6, 1864; typhoid fever.
287	Murray, L., Pt., H, 1st Maine Heavy Artillery, age 18.	May 27, June 8, 1864.	Left; circular. Surg. R. B. Bontecou, U. S. V. Died June 8, '1864; exhaustion.
288	Nailan, P., Pt., H, 3d Rhode Island.	June 16, —, '62.	Right. Died July 27, 1862; diarrhœa.
289	Newburg, H..Pt..F, 24th Massachusetts, age 28.	Aug. 12, 24, '64.	Left; circular. A. A. Surg. W. L. Welles. Died August 29, 1864; mortification of stump.
290	Nivemeyer, J., Pt., G, 33d Iowa.	April 30, May 4,'64.	Right. Died May 13, 1864.
291	Norton, M., Pt., I, 73d N. York, age 23.	July 3, 21, '63.	Left. Died August 1, 1863. *Spec.* 1453.
292	Owens, G. H., Pt., F, 6th Maine, age 18.	Nov. 7, 11, '63.	Right: circular. Surgeon D. W. Bliss, U. S. V. Died January 31, 1864; variola. *Spec.* 1769.
293	*Piles, W.*, Pt., A, 3d Virginia.	Aug. 30, Sept. 10, 1862.	Right. Died October 21, 1862; pyæmia.
294	Pinager, J., Pt., H, 12th Missouri Cavalry, age 24.	Dec. 15, 25, '64.	Left; ant. post. flap. Ass't Surg. W. B. Trull, U. S. V. (Gang.; tetanus.) Died December 27, 1864; inflammation of lungs.
295	Poole, J. H., Lieut., I, 52d Ohio, age 33.	June 27, July 17, 1864.	Left; flap. Surg. J. E. Herbst, U. S. V. (Gangrene.) Died July 30, 1864; pyæmia.
296	Porsno, L., Pt., B, 14th New Jersey, age 23.	May 6, 17, '64.	Left; circular. A. A. Surgeon T. Carroll. Died Sept. 24, 1864.
297	Porter, G. H., Pt., D, 3d Indiana Cavalry, age 31.	May 5, 17, '64.	Right; circular. Ass't Surg. W. Thomson, U. S. A. (May 5, Syme's amputat'n.) Died June 4, 1864; pyæmia.
298	*Redd, J. P. D.*, Serg't, E, 13th Virginia.	Dec. 13, 16, '62.	Left; circular. Died January 12, 1863.
299	Relyea, H., Pt., I, 2d N. York Heavy Artillery, age 52.	June 18, July 4, 1864.	Left; circular. A. A. Surg. W. H. True. (Gangrene.) Died July 10, '64; exhaustion. *Spec.* 2763.
300	Reynolds, P., Pt., K, 5th New Jersey, age 19.	June 17, 20, '64.	Left; circular. Surg. W. Watson, 105th Penn. Died July 30, 1864; exhaustion. *Spec.* 4578.
301	Rickman, F., Pt., K, 55th Massachusetts.	July 8, 13, '64.	Left; antero-posterior flap. Died July 28, 1864; pyæmia.
302	Ruthledge, J.W., Serg't, E, 97th Indiana, age 30.	June 15, 30, '64.	Right; circular. A. A. Surg. J. W. Digby. Died July 6, 1864.
303	Schulz, P., Pt., K, 4th Artillery, age 28.	May 3, 20, '63.	Right. Surg. J. H. Baxter, U. S. V. Died May 31, 1863; tetanus. *Spec.* 1136.
304	Scott.G.B.,Corp'l, K,8th N. Y. Cavalry, age 19.	June 9, 20, '63.	Right. Died July 1, 1863; erysipelas. *Spec.* 1347.
305	Shaffle, J., Pt., H, 90th Pennsylvania, age 29.	Dec. 13, 25, '62.	Right. A. A. Surg. D. Weisel. Died January 12, 1863; pyæmia. *Spec.* 479.
306	Shlaffly, C., Pt., F, 1st Pennsylvania Rifles.	Sept. 14, Oct. 3,'62.	Left. Surg. H. S. Hewit, U. S. V. Died October 17, 1862. *Spec.* 439.
307	Shoemnker, I., Pt., H, 57th Ohio, age 33.	Jan. 11, 31, '63.	Left. (Jan. —, amp. ankle joint.) Necrosis; gangrene. March 8, re-amp. leg, middle third. Died March 19, 1863; gangrene.
308	Simmons, N. E., Pt., K, 3d Tennessee, age 26.	May 14, June 8, 1864.	Right; circular. Ass't Surg. C. C. Byrne, U. S. A. Died June 16, 1864; pyæmia.
309	Simpson, C. H., Pt., C, 143d New York.	Oct. 29, Nov. 18, 1863.	Left. Ass't Surg. C. S. Frink, U. S. V. Died November 25, 1863; pyæmia.
310	Smith, H., Serg't, K, 2d Infantry.	Sept. 17, Oct. 3,'62.	Left. Died October 15, 1862.
311	Smith, H. S., Pt., F, 11th New Jersey, age 21.	May 12, 21, '64.	Left; ant. post. flap. Dr. Lewis, Philadelphia. Exfoliation. Died November 22, 1864; pyæmia.
312	Smith, L., Pt., D, 12th Infantry, age 24.	May 12, 21, '64.	Left; circular. A. A. Surg. C. H. Osborn. Large bed-sores. Died June 3,'64; pyæmia. *Spec.* 2739.
313	Smith, P., Corp'l, C, 3d New Hampshire, age 19.	Aug. 16, 22, '64.	Left; circular. A. A. Surg. C. F. Bullen. (Amp. right leg.) Died August 30, 1864; exhaustion.
314	Smith, T., Pt., G, 28th Connecticut.	June 14, —, '63.	Left. Died June 29, 1863.
315	Snyder, A. W., Corp'l, K, 183d Pennsylvania, age 20.	Mar. 25, April 5, 1865.	Right; circular. A. A. Surg. H. E. Woodbury. Died April 24, 1865; pyæmia.
316	*Starwalt, M.*, Pt., K, 5th North Carolina, age 21.	Oct. 19, Nov. 1, 1864.	Left; circular. A. Surg. W. H. Williams, 5th North Carolina. Died Nov. 10, 1864; pleuritis.
317	Sterling, G., Pt., I, 20th Maine, age 27.	Sept. 30, Oct. 11, 1864.	Left. Lenoir's method. Surg. R. B. Bontecou, U. S. V. Erysipelas; gangrene. Oct. 15, amp. thigh. Died October 20, 1864; exhaustion. *Spec.* 3285.
318	Steward. A. R., Pt., B, 34th Illinois.	April 6, 20, '62.	Left. Died April 25, 1862.
319	Steward. R., Pt., I, 8th Penn. Reserves.	Dec. 13, 27, '62.	Left. Died December 28, 1862.
320	Stoerzer, H., Pt., B, 22d Massachusetts.	July 1, 27, '62.	Left. Died July 28, 1862.
321	Stone, W., Pt., D, 2d Connecticut H'vy Artillery, age 32.	June 1, 27, '64.	Left; ant. post. flap. Ass't Surg. W. Webster, U. S. A. Died July 24, 1864; pyæmia.
322	Thompson, J., Pt., A, 14th N. York Cavalry, age 21.	April 9, 24, '64.	Left; flap (erysipelas). A. Surg. A. Hartsuff, U. S. A. Died May 5, 1864; pyæmia.
323	Trumpleman, O., Lieut., C, 119th New York.	July 3, 20, '63.	Right (hæmorrhage). Died July 24, 1863. *Spec.* 1459.
324	Vangelder, L., Pt., D, 107th N. York, age 21.	May 25, June 24, 1864.	Left; circular. A. A. Surg. H. C. May. (Necrosis.) Died July 29, 1864; diarrhœa. *Spec.* 3496.
325	*Vermillion, J. K.*, Pt., B, 1st Virginia Artillery, age 20.	July 24, Aug. 5, 1864.	Left; circular. A. A. Surg. A. R. Gray. (Necro.); pyæmia. Died August 20, 1864. *Spec.* 3808.
326	*Wagers, J.*, Pt., B, 14th South Carolina, age 17.	April 2, 5, '65.	Left; circular. Died April 19, 1865; pyæmia.
327	Waters, D. J., Pt., F, 60th Ohio, age 21.	May 11, 25, '64.	Left; circular. Surg. R. B. Bontecou, U. S. V. Died June 25, 1864; pyæmia.
328	Webber, G. A., Pt., A, 20th Maine, age 19.	May 6, 29, '64.	Left; circular. Ass't Surg. W. F. Norris, U. S. A. Died July 10, 1864; exhaustion and chronic diarrhœa. *Spec.* 3534.
329	Wetzel, J., Pt., C, 165th New York.	May 27, J'ne 8,'63.	Right. Died June 12, 1863. *Spec.* 1306.
330	Wilson, H., Serg't, A, 71st Ohio, age 26.	Sept. 2, 20, '64.	Left; flap. A. A. Surgeon D. H. Bell. (Gangrene.) Died Sept. 24, 1864; exhaustion.
331	Wood, L., Pt., D, 5th New Hampshire, age 15.	April 6, 18, '65.	Right; circular. A. A. Surg. C. H. Pegg. Died April 26, 1865. *Spec.* 4098.
332	Woodward, H. B., Serg't, E, 125th New York, age 22.	Aug. 16, Sept. 10, 1864.	Left; circular. A. A. Surg. G. P. Sargent. (Sloughing.) Sept. 20, and Oct. 5, hæmorrh. Died December 7, 1864; pneumonia. *Specs.* 3658, 3657.
333	*Wormsley, L. W.*, Pt., K, 8th Florida, age 35.	July 2, 6, '63.	Left; necrosis. Dec. 29, amput'n thigh. Died Dec. 30,'63; exh'n.
334	Wright, M. F., Major, 20th Ohio, age 26.	Dec. 20, —, '64.	Left. (Dec. 20, excision tarsus.) Died January 7, 1865.
335	York, M., Pt., E, 120th New York, age 20.	July 2, 28, '63.	Right. (July 27, amp. left leg.) A. A. Surg. F. Hinkle Died Aug. 8, 1863. *Specs.* 1605, 1609.

[1] LIDELL (J. A.), *On Thrombosis and Embolism*, in *American Journal Medical Sciences*, 1872, Volume LXIV, p. 354, and *On the Secondary Traumatic Lesions of Bone*, in *U. S. Sanitary Commission Memoirs*, 1870, Surgical Volume I, p. 330.

Intermediary Amputations in the Leg, in which the Point of Operation is not specified.

In forty-seven instances of intermediary amputation in the leg the precise point of ablation was not indicated. Fifteen operations were successful and thirty-two fatal; they were performed on forty-six patients, in a fatal instance both legs having been removed. Twenty-nine were Union and seventeen Confederate soldiers.

CASE 781.—Corporal *W. Dunlap*, Co. E, Confederate Marine Corps, aged 32 years. was wounded during the naval engagement with the Confederate Steamer Atlanta, June 17, 1863. He was captured and treated at various hospitals, lastly entering West's Buildings, Baltimore, on February 11, 1864. Surgeon T. H. Bache, U. S. V., in charge of the latter, described the injury as a "shot fracture of the right leg, produced by an iron splinter, for which amputation of the leg was performed on June 25th." Surgeon A. Chapel, U. S. V., reported that the patient recovered and was sent to Fort McHenry April 10, 1864. The Confederate hospital records show that the man was ultimately retired from service January 31, 1865.

CASE 782.—Private *R. Field*, Co. A, 6th Virginia, was wounded in the leg during an engagement on June 21, 1862. On the following day he was admitted to Confederate hospital Chimborazo No. 2, at Richmond, the records of which show the following description of the injury and its result: "There was a gunshot comminuted fracture of the tibia and fibula, implicating the ankle joint, the point of entrance being just above the external malleolus and that of exit three-fourths of an inch above the internal malleolus. When admitted the ankle joint was swollen and painful, but there was no swelling above the seat of the fracture, and no fever. On consultation it was decided to save the limb, which was laid on a pillow, cold-water dressings being applied and poultices used to promote suppuration. By June 26th there was high inflammatory fever, which abated on June 30th. The ankle joint was now greatly swollen and red and suppurating considerably; patient very much emaciated; appetite poor. Amputation of the leg was performed on July 2d, and on the night following hæmorrhage took place from the stump. This was checked by elevating the stump and the application of cold water. The patient continued to decline, and died on the next day, July 3, 1862. An examination of the amputated leg revealed extensive injury to the soft parts in addition to the comminution of the bone. The tibia was split for three inches, and the ankle joint was filled with pus."

TABLE LXXV.

Summary of Forty-seven Intermediary Amputations in the Leg, the Point of Ablation unspecified.

[Recoveries, 1—15; Deaths, 16—47.]

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.	NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.

[1] SWINBURNE (J.), *Unnecessary Amputation of the Leg—Tetanus—Death*, in *Medical and Surgical Reporter*, Philadelphia, 1863, Vol. X, p. 319.

In the case of Private *M. McDaniel*, Co. K, 48th Virginia (No. 37, TABLE LXXV), the left femoral artery was unsuccessfully ligated eighteen days after the amputation.

SECONDARY AMPUTATIONS IN THE CONTINUITY OF THE LEG FOR SHOT INJURY.—Of the amputations in the leg for shot injury, the secondary operations give the most favorable results. Of four hundred and forty-four cases, one hundred and seventeen were fatal, a mortality rate of 26.3 per cent., or 4.6 per cent. less than the fatality of the primary operations. One hundred and thirty-three operations were performed in the upper third, one hundred and seventy-four in the middle third, one hundred and twenty-one in the lower third of the leg, and in sixteen instances the reports failed to indicate the precise point of ablation.

Secondary Amputations in the Upper Third of the Leg for Shot Injury.—Of the one hundred and thirty-three cases of this group, thirty-seven, or 27.8 per cent., had fatal terminations. In sixty-two cases the right, in sixty-seven the left leg was removed; in four this point was not recorded.

Examples of Recovery after Secondary Amputations in the Upper Third of the Leg for Shot Injury.—The ninety-six successful operations were performed—thirteen on Confederate and eighty-three on Union soldiers. Of the latter, eighty-one became pensioners; ten have died since the date of their discharge from the army.

CASE 783.—Private *B. Fields*, Co. C, 27th North Carolina, aged 21 years, was wounded in the right leg and taken prisoner at Antietam, September 17, 1862. He entered hospital No. 5, at Frederick, ten weeks afterwards, where Surgeon H. S. Hewit, U. S. V., recorded the following description of the injury: "A gunshot wound of the tibia and fibula by a minié ball; continuity of bone entirely destroyed; leg very much swollen, offensive, and filled with pus. Flap amputation at the upper third of the leg was performed on November 28th by Acting Assistant Surgeon A. V. Cherbonnier. The stump was closed with three stitches and wet strips of muslin. Reaction was very satisfactory; patient cheerful. On the next day the dressing was removed and some adhesive strips were applied, the stump looking well but there being some pain, for which one grain of morphia was administered. On November 30th the patient looked and felt well, having slept nearly all night; appetite good; wound suppurating well; stump dressed with lint and cold water and well supported with a roller. Secondary hæmorrhage occurred on December 1st, when the popliteal artery was ligated by Surgeon Hewit. One week afterwards the ligature had not yet come away, but there was hæmorrhage from the wound, the cause of which was not very obvious. The tourniquet was then applied to the femoral and the wound filled with charpie saturated with solution of persulphate of iron. By December 11th the wound in the popliteal space was suppurating; stump healthy looking and dressed with wet strips of muslin; patient pale in appearance, and ordered to take three grains of quinine and five grains of tartrate of iron and potassa every four hours. Early on the morning of December 15th another tolerably severe hæmorrhage took place, the popliteal ligature not yet having come away; continued the tourniquet to the femoral and prescribed quinine and iron, cod-liver oil, and egg-nog. Two days later the tibia was found to protrude; tourniquet still kept applied, though a little slackened. On December 18th there was another hæmorrhage, the loss of blood being about six ounces, controlled by tightening the tourniquet. By December 20th reaction was slowly established, though the patient's face was still bloodless; appetite tolerably good; treatment continued. An attack of diarrhœa had been promptly arrested by the administration of rhubarb powder, ipecacuanha, and opium. December 24th, patient rallying, though the stump still gives evidence of a low state of vital powers. Several days afterwards the stump looked healthier, and on December 29th, when the patient was transferred to hospital No. 1, he was in good spirits and good granulations were springing up." Assistant Surgeon R. F. Weir, U. S. A., in charge of the latter hospital, recorded the subsequent progress of the case as follows: "The stump continued to look and suppurate well, the patient having but very little pain and his bowels remaining in good condition; appetite improving. For three days previous to January 26th he complained of great tenderness along the inner side of the thigh, where, on examination, fluctuation was detected, and where an incision was made which was followed by the evacuation of ten ounces of pus, the sinus extending under the deep muscles of the posterior and outer aspect. Injections of hydrochloric acid and laudanum diluted in water were then used, and by January 27th the ulcer of the stump had nearly cicatrized and the cavity of the abscess was rapidly filling up; patient improving in general health and able to sit up most of the time. About two weeks later the patient was in very good condition and going about on crutches, the stump cicatrizing rapidly and looking healthy. On February 28th the patient was discharged from hospital treatment, his general condition having improved very rapidly and the ulcer of the stump having healed." Several days afterwards the patient was paroled and sent south. The Confederate hospital records show that the man was admitted, on March 18th, to the General Hospital at Petersburg, and that he was permitted to leave for his home, on furlough, April 6, 1863. The greater portion of the amputated bones of the injured leg (*Spec.* 751), contributed to the Museum

FIG. 309.—Ununited comminuted fracture in the right tibia and fibula.—*Spec.* 751.

by Dr. Cherbonnier, are represented in the annexed wood-cut (FIG. 309), showing an ununited comminuted fracture of both bones in the lower part, followed by an effusion of a large amount of callus, fragments being attached to the fibula, while the tibia is carious within.

CASE 784.—Private B. F. French, Co. H, 7th New Hampshire, aged 21 years, was wounded in the right ankle during the attack on Fort Wagner, July 18, 1863. On the following day he was admitted to hospital No. 9, at Beaufort, where secondary amputation was performed by Assistant Surgeon J. F. Weeds, U. S. A., who recorded "a musket ball wound of the right foot, followed, on September 19th, by amputation of the leg at the upper third, Lake's operation being employed." The patient was subsequently transferred to McDougall Hospital at Fort Schuyler, and thence, on November 4th, to Lovell, at Portsmouth Grove. Surgeon L. A. Edwards, U. S. A., in charge of the latter hospital, reported that the stump was the result of an antero-posterior flap amputation, also that it had become unhealthy at the time of admission and showed a disposition to slough, for which bromine was applied. On March 3, 1864, the patient obtained a furlough, and subsequently he entered Central Park Hospital, New York City, where he was supplied with a "Hudson" artificial leg. Surgeon B. A. Clements, U. S. A., reported the following recapitulation and result of the case: "The injury was at the ankle, the missile passing from within outward and fracturing the bones entering into the composition of the joint. Not much hæmorrhage took place. Water dressings were applied at first, and three days after the injury the ball was searched for but could not be found. Three weeks later the missile was removed, about which time erysipelas attacked the parts, extending up to the groin, but soon disappearing. The amputation was performed on account of extensive necrosis, the patient being under the influence of chloroform and ether. Sutures and adhesive strips were applied. The stump was very slow in healing, but at the time of the patient's admission to Central Park Hospital, June 21st, it was in good condition." The man was discharged from service at his own request, October 7, 1864, and pensioned. He was paid September 4, 1880. In his applications for commutation he continues to report the stump as being in good and healthy condition. A cast of the stump (*Spec.* 4373), made thirteen months after the date of the amputation and contributed by Acting Assistant Surgeon G. F. Shrady, is shown in the adjoining wood-cut (FIG. 310), and exhibits the cicatrix extending transversely across the face of the stump, which is well formed.

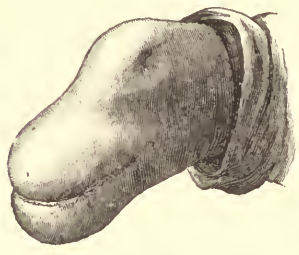

FIG. 310.—Stump of right leg thirteen months after antero-posterior flap operation. *Spec.* 4373.

CASE 785.—Private H. Dimock, Co. K, 52d Pennsylvania, aged 20 years, was wounded in the left leg, fracturing the tibia, at Fair Oaks, May 31, 1862. One week after the reception of the injury the wounded man was conveyed to Philadelphia, where, after undergoing treatment at various hospitals, he was discharged from service April 21, 1863, Surgeon I. I. Hayes, U. S. V., in charge of Saterlee, certifying to "the wound rendering the limb of no use." Examining Surgeon C. Marr, of Honesdale, Pennsylvania, certified, September 25, 1863: "He received a gunshot wound through the leg below the knee, producing a false joint." Several years later Drs. J. D. Lewis and J. M. Farrington, of Trumansburg, New York, testified that they examined the pensioner and found him suffering from the effects of the wound, also that they deemed amputation of said leg necessary, which was performed by the former on February 12, 1867, about five inches below the knee joint. They further certified that after the amputation they examined the wound carefully and found the tibia one and a half inches gone, a cartilaginous union having formed a false joint in its stead, and the fibula being partially dislocated at the knee joint in consequence of the whole weight of the body being thrown upon it in walking. Below the cartilaginous union in the tibia a number of pieces of lead were discovered in the substance of the bone below the periosteum, all of which rendered the leg useless and a source of irritation, causing a decline of his general health, etc. Dr. Farrington also stated that in addition to the condition described the tibia contained an oblique irregular fracture. About a year after the date of the amputation the pensioner was supplied with an artificial leg by the firm of B. F. Palmer, of Philadelphia, who described the operation as having been performed by "flap method." In his subsequent application for commutation the pensioner represented the condition of the stump as "sound." He was paid December 4, 1879.

FIG. 311.—Portions of left tibia and fibula—anterior view. *Spec.* 5580.

CASE 786.—Private G. C. Flanders, Co. E, 8th Ohio, aged 18 years, was wounded in the left leg, at Winchester, March 23, 1862. He was treated at several hospitals and lastly at Camp Dennison, where he was discharged for disability November 1, 1862. Surgeon B. Cloak, U. S. V., certified to "gunshot wound in the upper third of the tibia, producing compound comminuted fracture. At present the flexors of that extremity are very much contracted, rendering the leg nearly two inches shorter," etc. Some months after being discharged the man re-entered the service and joined the 11th Ohio Cavalry, in which organization he served until May 26, 1865, when he was finally mustered out and pensioned. At the time of receiving his last discharge he was quite lame, the wound having broken out anew about two months previously and requiring surgical operations subsequently. Examining Surgeon J. W. Toward, of Augusta, Maine, in 1867, certified to the injury, and stated that "some of the bone has been taken out and the ball remains in the leg. The wound frequently breaks out and is painful. He wears an apparatus attached to the boot and extending to the hip, relieving the leg of pressure by the weight being sustained by the hip and thigh. I think amputation will prove necessary," etc. Two years later Dr. J. C. Reeve, of Dayton, Ohio, certified that during the six years following the reception of the wound the pensioner had seven operations performed on the leg without cure, and added: "On June 17, 1868, I amputated Flanders' wounded limb, and subsequently I attended him for some weeks. Examination of the bones after the operation showed that the ball, apparently a minié, had perforated the bone in an upward direction and remained embedded in the head of the tibia just below the line of the amputation." The amputated bones are represented in the wood-cuts (FIGS. 311, 312). The missile is battered, considerably flattened, and embedded

FIG. 312.—Posterior view of the same specimen.—[*Spec.* 5580.]

in a projecting form in the posterior surface of the tibia. The specimens were contributed to the Museum by the operator. About nine months after the date of the amputation the pensioner was well enough to commence using a "Palmer" artificial leg. In the following year he described the stump as being in a "sound condition," but stated that the artificial limb did not prove satisfactory. He died on June 16, 1872. The immediate cause of his death has not been ascertained.

CASE 787.—Private F. Mullen, Co. E, 43d New York, aged 21 years, was wounded in the left leg, at Fredericksburg, May 3, 1863, and subsequently underwent secondary amputation. Surgeon J. A. Lidell, U. S. V., who performed the operation,[1] forwarded the following descriptive history: "The wound was caused by a minié ball, which passed through and fractured the tibia in the lower third. The man was brought to Stanton Hospital, Washington, three days afterwards. His general condition was good, and it was judged expedient to attempt to save the limb without operation. It was accordingly placed in Hodgen's splint and cold-water dressings were applied; stimulants administered. After several days the parts suppurated freely, and by June 1st the wounds were discharging a good and healthy pus, consolidation taking place, and appetite and pulse being normal. The parts continued to heal nicely up to July 28th, when the patient fell and re-fractured the limb while attempting to walk across the Ward. On August 2d, several pieces of bone were removed. August 15th, parts œdematous; discharge thin and fetid. On August 19th, several openings for the exit of pus were made, when a small necrosed splinter came away; pulse weak; general health suffering. The leg remained in about the same condition until September 1st, when compression by bandage was applied. About October 1st there was both general and local improvement, the discharge being of a thick and healthier character. The splints were now removed and stimulants continued. One month later necrosis of the shaft of the tibia had become extensive, the dead bone being completely encased in an involucrum; condition fair; discharges from several openings. But little change took place up to December 1st, and none for the better for one month afterwards. The involucrum was now large and the skin covering the front of it thin and about to ulcerate extensively; the foot being considerably twisted inward by abnormal muscular action (partial talipes varus) and the deformity steadily increasing; ankle joint also becoming stiff. There being now no hopes of preserving a useful limb it was deemed advisable to remove it by amputation. The operation was performed on January 9th, at the junction of the upper and middle thirds, by the flap method (double flaps, the anterior one being short). The sawn end of the tibia was beveled off as recommended by Sanson, that is, by placing the saw obliquely—not on the ridge, but on the internal surface of the bone. The fibula was divided somewhat higher up than the tibia, as practised by Roux. Throughout the operation the patient was kept insensible by sulphuric ether. He did not exhibit any perceptible shock. The flaps were carefully coaptated and secured at several points by interrupted sutures and strips of isinglass plaster. Several turns of a roller were placed around the leg to serve as a supporting bandage; but no other dressing was applied. A full anodyne was administered after the operation and another at 12 P. M. On the following day the patient was sitting up in bed reading a newspaper, the stump being in fine condition, free from heat and redness, and almost devoid of pain and swelling. On January 13th the sutures were removed and the stump was dressed for the first time and found to be uniting by primary adhesion. There was no constitutional disturbance whatever. On January 24th the last ligature, that of the posterior tibial artery, came away. The patient had not at any time nor in any way suffered in consequence of the amputation, and the stump had united by first intention. In short, he recovered precisely in the same way as the most fortunate cases of amputation of the leg on account of disease get well." The amputated bones of the leg (*Spec.* 2022) were contributed to the Museum by the operator and are represented in the wood-cut (FIG. 313), showing the fractured tibia, with an abundant involucrum formed to nearly the point of section, and a large detached but imprisoned sequestrum being exhibited through the cloacæ. A few points of osseous deposit are also seen on the fibula, which is uninjured. The patient entirely recovered, and was ultimately discharged September 5, 1864, and pensioned. In his application for commutation, dated 1870, he described the condition of the stump as being "in good order." He died March 5, 1871. The cause of his death has not been ascertained.

FIG. 313.—The lower thirds of the bones of the left leg, with involucrum of the tibia. *Spec.* 2022.

Fatal Cases of Secondary Amputations in the Upper Third of the Leg for Shot Injury.—The thirty-seven operations belonging to this group were performed—seven on Confederate and thirty on Union soldiers. Pyæmia was noted in eight, gangrene in one, secondary hæmorrhage in five, diarrhœa in three, and exhaustion in twelve instances as the immediate cause of death.

CASE 788.—Private S. R. Twitchell, Co. G, 89th New York, aged 25 years, was wounded in the left leg, at Antietam, September 17, 1862, and admitted to hospital at Chester two weeks afterwards. Surgeon J. L. LeConte, U. S. V., recorded the following history: "The injury was just above the ankle joint and was followed by limited necrosis of the tibia and formation of pus, which was evacuated by two incisions, one on the anterior aspect about six inches in length, and the other posteriorly about three inches long. For three weeks after the incisions were made the wound progressed favorably. It then commenced to slough, and this went on until the external wound measured six inches long and three inches wide. On February 15, 1863, amputation was performed by the flap method at the upper third by Acting Assistant Surgeon L. Fisher. Tonics, stimulants, perchloride of iron, quinine, whiskey, beef-tea, etc., were administered. The case progressed satisfactorily for a week after the operation, when signs of constitutional irritation showed themselves and the patient gradually became worse. On February 28th he had a rigor, lasting twenty-five minutes, and the case was diagnosed as one of pyæmia. After this time the patient continued to sink until March 5, 1863, when he died. The *post-mortem* examination revealed nothing but pus in the knee joint." The amputated two lower thirds of the bones of the leg (*Spec.* 2067), contributed by the operator, show that the tibia was partially fractured in the lowest third, the injury being nearly repaired by callus, leaving, however, a sinus in the bone.

[1] LIDELL (J. A.), *On the Major Amputations for Injuries in both Civil and Military Practice*, in *Am. Jour. Med. Sciences*, 1864, Vol. XLVII, p. 376.

CASE 789.—Private H. Linn, Co. A, 6th Pennsylvania Reserves, aged 25 years, received a shot fracture of the left leg, at Antietam, September 17, 1862. Two weeks afterwards he was admitted to hospital No. 5, at Frederick, where Surgeon H. S. Hewit, U. S. V., noted the following description and treatment of the injury: "A minié ball entered the lower part of the leg inside the gastrocnemius tendon, and emerged on the outer side of the leg near the crest of the tibia and six inches from the knee joint. On October 15th a fragment of lead was cut out from the outer part of the leg near the wound. Subsequently a sinus formed up the intermuscular space for four inches, for which incisions and poultices were applied, eight pieces of tibia being removed during the treatment. Towards the last week in November the patient was doing well. On December 3d a small portion of the fibula above the malleolus was excised. The bones were found considerably necrosed, and amputation, it was thought, would be necessary. On the next day the wound looked badly, the patient suffered a great deal, and amputation at the upper third was performed by flap method by Acting Assistant Surgeon A. V. Cherbonnier. In the following night the stump had to be re-opened in order to arrest hæmorrhage from some of the small vessels, persulphate of iron being used; and when the bleeding ceased dry lint was applied. By December 17th the soft parts of the stump were much retracted, the ends of both bones exposed and necrosed, and there was an apparent effort at formation of an involucrum. Ten days later the granulations were healthy and the patient's condition had improved." On December 29th the man was transferred to hospital No. 6, and subsequently to No. 1. Assistant Surgeon R. F. Weir, U. S. A., in charge of the latter, recorded the following result of the case: "Secondary amputation of the thigh was performed at the junction of the middle and lower thirds of the femur by Surgeon J. B. Lewis, U. S. V., on January 15, 1863. The patient progressed favorably until February 4th, when secondary hæmorrhage supervened, which was checked only by ligation of the femoral at the point of election. February 15th, patient about the same; pulse 135 and rather quick; tongue red and dry; sloughing condition of stump disappeared and healthy granulations commencing. Brandy administered every half hour; also beef-tea and cod-liver oil. After this the patient began to do well; appetite better; pulse much stronger; stump beginning to heal. On February 21st the ligature was removed from the femoral. On March 5th the patient was slightly etherized, and a piece of dead bone about one and a half inches in length was sawn off from the end of the femur; some small pieces were taken out with the forceps; patient doing well otherwise; stump dressed with adhesive strips and cold water. For about two weeks after this the patient still improved and felt quite comfortable; stump assuming a better appearance. At an examination on March 19th a sinus was discovered to be extending up on the posterior aspect to about the middle of the stump, and the bone was found to be dead when felt by the probe, with indications that the process of separation was going on; discharges copious, offensive, and of a dark color. Poultices were continued after syringing the parts with soda wash, and brandy, with generous diet, was ordered. By March 23d the patient's general health was quite poor and he had but little appetite; stump not looking very healthy, there being considerable necrosed bone to come away; suppuration not as healthy as before. Two days later the patient was worse and weaker; tongue coated; teeth covered with sordes; appetite poor; stump suppurating pretty freely and still having an offensive odor about it, but integuments looking healthy. On March 28th the patient complained of soreness over the shoulder; general health about the same; stump looking rather better; appetite improving. On March 30th he was quite weak; tongue coated and dry; pulse 140; skin dry and getting more yellow; stump doing poorly; discharge unhealthy. Extensive necrosis of the femur was felt by the probe; wound syringed with acid and soda wash alternately and poultices applied. The next day the patient failed rapidly. At 1 P. M. he had a slight hæmorrhage from the opening in the stump, losing about one and a half ounces of blood. No bleeding vessel could be found. Death occurred at 4 P. M. On examining the chest eleven hours after death the left lung was found thinly studded with tubercles; lower lobe of right lung thickly studded in upper and middle portion; middle lobe a complete mass of tubercular matter and filled here and there with abscesses from the size of a chestnut to that of a pullet's egg; upper lobe in the same condition. Heart normal in size; liver somewhat enlarged and very fatty; spleen very much enlarged and highly congested; kidneys enlarged and fatty, and pelvis containing a large amount of phosphatic deposit on right side, also renal calculi in upper portion of urethra. Specimen 3818 (FIG. 315), consisting of the stump of the femur, shows extensive necrosis from the seat of the operation to within an inch of the trochanter minor, the shaft on the outer side being thinly covered with an involucrum. On the posterior surface the involucrum is bare from the end of the bone to within three inches of the trochanter major, it having been broken down by ulcerative process, while on the anterior portion of the shaft the sequestrum is exposed at several points from the same cause. The neck of the bone was observed to be very short and its head quite large. Specimen 3983 (FIG. 316) comprises a portion of the external iliac and femoral arteries, including the occluded portion of the latter, also part of the profunda and anastomotica magna, the end of which is covered with adipose tissue." The amputated portions of the bones of the leg (*Spec.* 748), contributed by Surgeon Hewit, are shown in wood-cut (FIG. 314), exhibiting the fibula with loss of substance of one inch in the lower third, and the adjacent portion of the tibia, which is superficially necrosed, while the superior portion of the fibula shows increased periosteal action.

FIG. 314.—Portions of fractured tibia and fibula of left leg. *Spec.* 748.

FIG. 315.—Stump of left femur. *Spec.* 3818.

FIG. 316.—Portions of external iliac, femoral, profunda, and anastom mag.; femoral ligated. *Spec.* 3983.

CASE 790.—Private J. E. Eames, Co. F, 112th New York, aged 23 years, was wounded in the left leg, during the assault on Fort Fisher, January 15, 1865. He was conveyed to New York, and entered McDougall Hospital at Fort Schuyler ten

days after receiving the injury. Assistant Surgeon S. H. Orton, U. S. A., who amputated the wounded limb, made the following report: "The wound was caused by a minié ball striking the outer aspect one and a half inches above the ankle, passing downward, inward, and a little backward, and emerging at the internal border of the tendo-achillis. At the time of the amputation, February 28th, the muscles were pale and flabby and there was not much retraction. The operation was performed by the circular method about three inches below the patella, the spine of the tibia being sawn off after severing the bones. The soft parts were cut above the division of the popliteal, so that was the only artery requiring ligation. After severing the limb the incised edges of the integuments were brought together and held by a suitable number of sutures. Chloroform was used and the patient passed through the operation very well; in the evening his general appearance was better than it had been for a week. Water dressings were applied and oakum to catch the discharge. Stimulants, tonics, and a most nourishing diet were administered. On March 3d the ligature came away; stump looking healthy; discharge free; pulse 120. The integument over the upper part of what remained of the spine of the tibia ulcerated, exposing a small portion of the bone. The patient died of exhaustion March 17, 1865. An examination of the amputated limb showed that the ball had passed through the base of the external malleolus and grazed the external border of the articulating surfaces of the tibia and astragalus, both of which were apparently necrosed. The whole ankle joint was filled with pus, as was also the articulation between the astragalus and scaphoid bone. The soft parts were œdematous and filled with sinuses running in every direction. The foot presented the anatomical curiosity—though not bearing on the case—of containing six toes, the supernumerary one being situated between the normal fourth and fifth. On dissection it was found that there were only five metatarsal bones, but the fifth was double the natural size in breadth and had two phalangeal articulations. The patient stated that both his father and grandfather were afflicted with the same deformity. His right foot was normal."

CASE 791.—Private H. Loud, Co. A, 183d Pennsylvania, aged 18 years, was wounded at the Wilderness, May 8, 1864. Surgeon J. E. Pomfret, 7th New York Artillery, reported his admission to the field hospital of the 1st division, Second Corps, with "wound of left ankle by a musket ball." Surgeon N. R. Moseley, U. S. V., who amputated the fractured limb, reported the following result of the case: "The wounded man was admitted on May 28th to Emory Hospital, Washington, where the soft parts became gangrenous and the bones of the ankle joint necrosed; tibia and fibula denuded of periosteum some three inches above the wound. Flap amputation of the leg at the junction of the upper and middle thirds was performed on August 23d, chloroform and ether constituting the anæsthetic. The after-treatment consisted of cold-water dressings, tonics, stimulants, and nourishing diet. Redundant granulations required the application of caustics about three weeks after the amputation. The patient's condition varied much after the operation, alternately recuperating and declining. He became weaker, yet, being young, hopes were entertained of his recovery until within a couple of weeks of his decease, when his appetite failed and he sank rapidly. Death occurred on October 14, 1864, from exhaustion and nervous irritability." The bones of the stump (*Spec.* 3318), exhibiting but little healthy action and showing sequestra which are about separating from each bone, were contributed to the Museum by the operator, and are represented in the adjoining wood-cut (FIG. 317).

FIG. 317.—Bones of stump of left leg seven weeks after amputation. *Spec.* 3318.

TABLE LXXVI.

Summary of One Hundred and Thirty-three Secondary Amputations in the Upper Third of the Leg for Shot Injury.

[Recoveries, 1—96; Deaths, 97—133.]

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.	NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Allbee, O. S., Pt., K, 102d Illinois, age 18.	May 15, J'y 17,'64.	Left; flap. Discharged March 29, 1865.	11	Brown, L. K., Pt., H, Purnell Legion, Maryland Vols., age 19.	Au.29,'62, Jan. 8,'64.	Left; flap. Surg. D. W. Bliss, U. S. V. Discharged August 18, 1864.
2	Andrews, S. B., Pt., F, 72d New York, age 28.	May 10, Sept. 27, 1864.	Right; flap. A. A. Surg. W. S. Ward. (May 10, resection of 2½ ins. of tibia; necrosis.) Disch'd November 27, 1864.	12	*Busby, T.*, Pt., F, 19th South Carolina, age 23.	N'v30,'64, Feb. 20, 1865.	Left; oval skin flap. Surg. B. B. Breed, U. S. V. Transferred to Provost Marshal May 6, 1865.
3	Atkinson, C. T., Serg't, G, 11th Ohio, age 27.	Sept. 17, Oct. 21, 1862.	Right; flap. A. Surg. J. S. Emerson, 9th N. Hampshire. Discharged January 16, 1863. Died December 3, 1870.	13	Chapin, H., Capt., D, 27th Illinois.	Sept. 20, Nov. 27, 1863.	Right. A. A. Surg. C. C. Shoyer. Discharged September 20, 1864.
4	Barraby, M., Pt., I, 12th Vermont, age 27.	Nov. 1, Dec. 20, 1862.	Left; circular. Ass't Surg. C. Wagner, U. S. A. Discharged May 17, 1863.	14	Chapman, H. E., Pt., A, 6th New Hampshire.	Aug. 29, Oct. 4,'62.	Right. Surgeon C. Page, U. S. A. Discharged March 8, 1863.
5	Bartram, A. E., Corp'l, I, 8th Connecticut, age 21.	Sept. 29, Dec. 15, 1864.	Left; circular. A. A. Surg. T. S. Bartram. (Hæmorrhage.) Discharged August 23, 1865.	15	Charlemaine, A., Pt., A, 55th New York.	May 31, J'y 21,'62.	Right. Discharged March 6, '63.
6	Bates, E. G., Pt., A, 123d Ohio, age 19.	June 14, Au.14,'63.	Left; circular. Discharged April 26, 1864.	16	*Connor, J. O.*, Pt., C, 27th Virginia.	July 22, Sep.–,'61.	Right. Surg. — Cooper, C. S. A. Recovered.
7	Becker, H., Corp'l, G, 162d New York, age 30.	April 8, May 13, 1864.	Right; ant. posterior flap. Surg. F. Bacon, U. S. V. Discharged August 12, 1864. *Spec.* 4313.	17	Cook, J., Pt., H, 101st Illinois, age 19.	May 25, Aug. 10, 1864.	Right; oval flap. A. A. Surg. J. O'Connor. Discharged January 24, 1865.
8	Berry, W. F., Corp'l, G, 7th Missouri.	May 22, Oct. 6, 1863.	Left; flap. Ass't Surgeon H. R. Tilton, U. S. A. Discharged May 20, 1864.	18	Copas, W. H., Pt., B, 36th Ohio, age 28.	Sept. 19, Oct. 26, 1864.	Right; circular Surgeon Z. E. Bliss, U. S. V. Hæmorrhage. Oct. 27, ligation of post. tibial artery. Dis'h'd June 5, 1865.
9	*Brashear, R. H.*, Pt., H, 3d Arkansas, age 20.	July 2, Sept. 1, 1863.	Left. Surgeon R. Batty, C. S. A. Transferred for exchange Nov. 12, 1863.	19	Copeland, M., Pt., B, 2d Colored Cavalry, age 28.	Aug. 10, Oct. 24, 1865.	Right; circular skin flap. Surg. F. E. Piquette, 86th C. Troops. Discharged January 16, 1866.
10	Brown, W., Pt., C, 15th Infantry, age 30.	Aug. 7, Oct. 18, 1864.	Right; ant. posterior flap. Surg. B. B. Breed, U. S. V., and A. A. Surg. R. McNeilly. Discharged May 23, 1865.	20	Coyle, C. D., Pt., D, 83d Pennsylvania.	June 27, Aug. 1, 1862.	Left; flap. Ass't Surg. R. Bartholow, U. S. A. Discharged May 3, 1863.
				21	Crawford, H. M., Corp'l, K, 116th N. Y., age 28.	April 8, May 16, 1864.	Left; anterior posterior flap. A. A. Surg. H. Smith. Discharged July 14, 1864.

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
22	Crist, A., Pt., F, 70th New York.	April 2, June 26, 1862.	Right; flap. Surg. A. B. Hasson, U. S. A. Discharged September 8, 1862.
23	*Daily, P.*, Pt., E, 48th Mississippi, age 25.	Oct. —, 20, '63.	——; flap. Surgeon — Holt, 16th Miss. Recovered.
24	Dawley, D., Pt., I, 9th Indiana, age 22.	June 2, J'y 6, '64.	Right; circular. Discharged May 15, 1865.
25	Dimock, H., Pt., K, 52d Pennsylvania, age 20.	May 31, 1862, Feb. 12, 1867.	Left; flap. Dr. J. D. Lewis of Trumansburg, N. Y. Disch'd April 21, 1863.
26	Dorn, D. H., Pt., E, 1st Cavalry, age 23.	June 12, Sept. 25, 1864.	Left; flap. Discharged May 15, 1865.
27	Eberhart, A. L., Pt., 1st W. Virginia Cavalry.	Sept. 12, 1862, J'e 18,'63.	Left. Dr. W. L. Clemmer, Brownsville, Penn. Recovered.
28	*Field, B.*, Pt., C, 27th North Carolina, age 21.	Sept. 17, Nov. 28, 1862.	Right; flap. A. A. Surg. A. V. Cherbonnier. Dec. 1, secondary hæm.; lig. of popliteal artery; recurrence. Exch'd. *Spec.* 751.
29	[1] *Finnigan, P.*, Pt., F, 1st Confederate Bat'ry.	June 2, Aug. 20, 1864.	Right; circular. Ass't Surg. W. F. Richardson, C. S. A. (June 3, Chopart's operat'n.) Recov'd.
30	Fisher, J. P., Pt., A, 7th Missouri Cavalry.	Aug. 16, Sept. —, 1862.	Right. Surg. E. P. Smith. 7th Missouri. Discharged February 6, 1863.
31	Fisher, P. B., Pt., I, 113th Ohio, age 27.	June 22, July 28, 1864.	Right; circular. Ass't Surg. G. W. Burke, 46th Penn. Disch'd June 26, 1865.
32	Flanders, G. C., Pt., E, 8th Ohio, age 18.	Mar. 23, 1862, J'e 17,'68.	Left; flap. Dr. J. C. Reeves, at Dayton, Ohio. Recov'd. Died June 16, 1872. *Spec.* 5580.
33	Flynn, M., Pt., A, 24th New York.	Aug. 30, Oct. 21, 1862.	Right. Ass't Surg. J. M. Palmer, 85th N. Y. Discharged September 26, 1863.
34	French, B. F., Pt., H, 7th New Hampshire, age 21.	July 18, Sept. 19, 1863.	Right; ant. posterior flap. Ass't Surgeon J. F. Weeds, U. S. A. Disch'd Oct. 7, 1864. *Spec.* 4373.
35	Gilson, D., Corp'l, G, 2d U. S. Sharpshooters.	Sept. 17, 1862, Sept. 17, 1863.	Left; flap. Dr. N. J. Moore, of Nashua, N. H. Disch'd March 2, 1863.
36	Goldsmith, W. H., Corp'l, F, 2d New Hampshire, age 24.	June 9, May 15, 1865.	Left; circular. A. A. Surg. J. S. Ross. (June 9, 1864, res. 4 ins. tibia.) Disch'd Oct. 14, 1865.
37	Grason, J. A., Pt., D, 6th West Virginia.	Aug. 28, 1864, Au. 8, '65.	Right; flap. Dr. J. R. Ramsey, of Clarksburg, West Virginia. Recovered.
38	Green, H. R., Pt., F, 81st Indiana.	De. 31,'62, Mar. 6, 1863.	Left; flap. Surg. F. Seymour, U. S. V. Discharged August 1, 1863.
39	Gurley, W., Pt., C, 11th Infantry, age 18.	May 12, 1864, Feb. 18, 1868.	Right. Dr. H. J. Bigelow, at the Mass. Gen'l Hosp. (June 1,'64, amp. at ankle joint. Necrosis.) Disch'd Feb. 7,'65. *Spec.* 2421.
40	Haire, R. R., Corp'l, E, 31st Illinois, age 32.	July 2, Aug. 10, 1864.	Left; circular. Surgeon G. L. Lucas, 47th Ill. (Gangrene.) Discharged June 22, 1865.
41	Hale, H., Pt., E, 84th Pennsylvania, age 20.	May 12, 1864, Jan. 8,'69.	Left. Dr. G. L. Potter, of Julian Furnace, Penn. Disch'd April 27, 1865.
42	Harback, M., Pt., D, 5th Kentucky, age 21.	May 27, Sept. 6, 1864.	Right; circular. Ass't Surg. T. A. McGraw, U. S. V. Disch'd June 9, 1865.
43	Hatch, D. A., Pt., C, 2d Massachusetts, age 25.	July 3, Dec. 16, 1863.	Right; ant. posterior flap. Surg. C. W. Jones, U. S. V. Disch'd April 2, 1864. *Spec.* 2155.
44	Hitchcock, J. N., Pt., F, 34th Massachusetts.	May 15, Sep. 5,'64.	Left; flap. A. A. Surg. A. Trau. Discharged April 19, 1865.
45	Hubbard, J. A., Corp'l, A, 115th New York.	Sept. 5, Oct. 9,'62.	Right; flap. Discharged December 30, 1862.
46	Hyatt, D., Pt., C, 4th Delaware, age 52.	June 18, Nov. 18, 1864.	Left; flap. A. A. Surg. A. Trau. (Erysipelas.) Discharged June 3, 1865.
47	Jenni, P., Serg't, C, Jefferson Co. State Militia, age 23.	Sept. 11, Oct. 18, 1862.	Right. (Also flesh w'nd of chest; hæm. from anterior tib. artery.) Discharged January 19, 1863.
48	Kellerman, M., Pt., D, 75th Penn., age 48.	May 2, June 18, 1863.	Left. Surg. D. W. Bliss, U. S. V. (Hæmorrhage.) Disch'd June 15, 1864. *Spec.* 1273.
49	[2] *Kelly, J. F.*, Pt., A, 26th Alabama, age 25.	July 28, Oc. 18,'64.	Right. Ass't Surg. A. H. Powell, P. A. C. S. (Gangrene.) Recov'd.
50	Keyes, C. W., Lieut., E, 32d Maine, age 33.	May 12, June 12, 1864.	Left; flap. Dr. P. Dyer, of Maine. (June 8, amp. foot.) Disch'd September 27, 1864.
51	Lay, R., Serg't, E, 1st Kentucky Light Artillery.	Dec. 18, 1864, Feb. 13, 1866.	Left; flap. Dr. C. P. West, at Louisville, Kentucky. Disch'd August 28, 1865.
52	Leighton, B. D., Pt., I, 9th New Hampshire.	June 4, July 29, 1864.	Left. Dr. O. H. Bradley, of East Jaffrey, N. H. Discharged February 11, 1865.
53	Lester, J. H., Pt., F, 1st New Jersey, age 20.	June 27, 1862, Feb. 8, 1863.	Left; posterior flap. A. A. Surg. R. A. Cleeman. Gangrene. Discharged December 24, 1863.
54	Logan, W. J., Pt., K, 9th Penn. Reserves.	Aug. 30, Dec. 23, 1869.	Left. Dr. J. Kirker, of Allegheny, Penn. 1869, popliteal aneurism; dry gangrene. Recovered.
55	Loughlin, J., Pt., K, 67th New York, age 22.	July 2, Sept. 16, 1862.	Left; flap. Surgeon S. D. Gross, U. S. V. (Erysipelas. July 26, Pirogoff's amp. at ankle joint.) Disch'd July 29, '63. *Spec.* 214.
56	McCarty, C., Corp'l, E, 1st New York, age 28.	June 30, Aug. 28, 1862.	Right. Ass't Surg. W. S. Forbes, U. S. V. (Excision of 3 ins. of tibia.) Discharged May 11, 1863. Died August 21, 1867.
57	McLain, D. P., Pt., F, 4th Cavalry, age 21.	Sept. 17, Dec. 22, 1863.	Right; flap. Discharged May 26, 1865.
58	Macomber, G. W., Pt., K, 126th New York, age 20.	July 2, Sept. 10, 1863.	Left; ant. posterior flap. (Gangrene.) Disch'd May 3, 1864. *Spec.* 4303.
59	Masten, D., Pt., G, 4th Illinois Cavalry.	Ap. 15,'64, April —, 1866.	Left. Surg. G. R. Bibb, of Jacksonville, Illinois. (Discharged September 17, 1864.)
60	*Moran, S.*, Pt., G, 26th North Carolina, age 24.	July 2, Oct. 28, 1863.	Right; flap. A. A. Surgeon J. E. Steele. Nov. 8, profuse hæmorrhage; flaps laid open; sloughing. Trans. to Fort Delaware April 19, 1864.
61	[3] Mullen, F., Pt., E, 43d New York, age 23.	May 3, 1863, Jan. 9, 1864.	Left; double flap. Surg. J. A. Lidell, U. S. V. Disch'd Sept. 5, 1864. *Spec.* 2022. Died March 5, 1871.
62	Newman, D. J., Pt., G, 24th Wisconsin, age 16.	June 27, July 31, 1864.	Left; circular. A. A. Surg. J. C. Thorp. (Gangrene.) Disch'd April 9, 1865.
63	*Newton, J. W.*, Pt., E, 14th Virginia, age 24.	July 3, Aug. 10, 1863.	Right; circular. (July 16, amp. foot, Pirogoff's opera.; sloughing.) Recovered. Transferred for exchange Nov. 12, 1863.
64	Norris, E., Civilian, age 20.	April 16, June 2, 1864.	Right; circular. Ass't Surg. J. E. Semple, U. S. A. Disch'd July 17, 1864.
65	Oughcltree, G., Serg't., A, 12th Infantry.	June 27, July 28, 1862.	Right. (Also fracture of skull.) Transferred to Veteran Reserve Corps August 14, 1863.
66	Perigo, R., Pt., G, 66th Ohio, age 44.	Aug. 14, Se. 20,'64.	Left; flap. Discharged June 9, 1865. Died September 4, 1866.
67	*Perrin, F.*, Pt., H, 8th Arkansas, age 25.	Nov. 30, 1864, Jan. 2, 1865.	Left; bi-lateral skin flap and circ. section of muscles. A. A. Surg. M. L. Herr. Trans. to Provost Marshal May 6, 1865.
68	Phillips, J. L., Serg't, C, 104th New York.	Sept. 17, Oc. 18,'62.	Right; flap. Discharged March 23, 1863.
69	*Pierce, O. H.*, Pt., H, 38th North Carolina.	June 30, Au. —,'62.	——. Surgeon W. A. Carrington, C. S. A. Recovered.
70	Powell, T., Pt., F, 6th Colored Troops, age 30.	Jan. 15, April 26, 1865.	Left; circular. Ass't Surg. S. H. Orton, U. S. A. (Jan. 15, exc. 3 ins. tibia.) Disch'd Oct. 14,'65.
71	Pyne, C. M., Lieut., I, 6th Infantry.	Aug. 30, 1862, M'y 4,'64.	Left; bi-lateral flap. Dr. W. H. Van Buren of New York. Retired December 15, 1870.
72	Redding, J., Pt., K, 42d Illinois, age 28.	Sept. 20, 1863, Jan. 17, 1864.	Left; circular flap. Surg. J. Y. Finley, 2d Kentucky Cavalry. Discharged Sept. 29, 1864.
73	Renold, C. D., Pt., D, 37th Ohio, age 22.	No. 25,'63, Feb. 26, 1864.	Left; circ. flap. Ass't Surg. B. E. Fryer, U. S. A. Disch'd Aug. 24, 1864. Died August 17, 1870.
74	Rhodes, J. H., Pt., A, 33d Ohio, age 30.	No. 25,'63, Jan. 13, 1864.	Left; flap. Ass't Surgeon A. G. Albright, 79th Penn. Disch'd July 15, 1864.
75	Ross, C., Lieut., E, 26th Pennsylvania, age 41.	July 2, —, '63.	Left. Discharged June 18, 1864. Died November 30, 1866.
76	Runyan, C. A., Musician, F, 9th N. Y. Heavy Artillery, age 19.	May 3, Oct. 17, 1863.	Left. Dr. L. Briggs of Auburn, N. Y. (May 3, excision of tibia.) Discharged July 26, 1865.
77	Sampson, T., Pt., H, 46th Colored Troops.	Sept. 8, Oct. 11, 1864.	Left; flap. Ass't Surg. J. H. Bennett, 46th Colored Troops. Discharged March 9, 1865.
78	Schmidt, C., Corp'l, K, 39th New York, age 36.	May 6, 1864, Feb. 18, 1865.	Right (May 23, 1864, lig. of ant. tibial art'y); ant. posterior flap. Surgeon S. B. Ward, U. S. V. Re-amputation April 18, 1865. Discharged July 14, 1865.
79	Shinn, W. J., Serg't, I, 5th New Jersey, age 25.	J'e 18,'64, Ja. 18,'65.	Right; flap. Surg. D. W. Maull, 1st Delaware. Discharged.

In five of the one hundred and thirty-three secondary amputations in the upper third of the leg re-amputation in the thigh became necessary; one patient survived and four succumbed to the operation.

Secondary Amputations in the Middle Third of the Leg for Shot Injury.—One hundred and seventy-four cases are included in this group; one hundred and thirty-seven terminated successfully and thirty-seven fatally, a mortality rate of 19.7 per cent. In eighty instances the right and in eighty-seven the left limb was amputated, and in seven cases this point was not indicated.

Recoveries after Secondary Amputations in the Middle Third of the Leg for Shot Injury.—Of the one hundred and thirty-seven patients who survived secondary amputation in the middle third of the leg twenty-three were Confederate and one hundred and fourteen Union soldiers. Of the latter one hundred and thirteen became pensioners, but twelve have died since the date of their discharge from the service—one of pyæmia, one of continued suppuration of the stump, one of exhaustion, one of apoplexy, one of chronic diarrhœa, one of phthisis, and six of causes not stated.

CASE 792.—Private O. L. Bell, Co. D, 1st Delaware, aged 19 years, was wounded in the right leg, at Antietam, September 17, 1862, and admitted to hospital at Frederick ten days afterwards. Acting Assistant Surgeon W. S. Adams forwarded the following history: "An examination revealed extensive comminuted fracture of both bones of right leg at the upper portion of the lower third, a transverse fracture at the upper third, and an oblique fracture running down to within two inches of the external malleolus. The limb was in Smith's anterior splint, which had been badly applied; and a piece of adhesive plaster, which had been placed just above the knee, had been allowed to receive the weight of the limb for six weeks. The result was that it cut through the skin, fascia, and to a considerable extent into the muscles, the incision made being seven inches long and at its middle two and a half inches broad. After taking it off the limb was readjusted in the same splint, in which it remained about three weeks longer, when it was placed in a fracture box. After union the leg showed two inches shortening. The patient's condition had remained good throughout, but on the morning of December 26th he had a severe chill, followed at 10 A. M. by considerable fever. On the next day there was some evidence of erysipelas on the leg and thigh, and three grains of quinine were prescribed every three hours, also fifteen drops of tincture of chloride of iron every four hours. On the following day erysipelas was very evident and extended from the ankle to the hip; limb hot and much swollen; pulse 130; tongue furred and bowels constipated. Saline cathartics were now ordered and lead and opium wash was applied. On December 29th the patient was no better and there was total loss of appetite. The limb was now suspended in Smith's anterior splint so as to allow a free passage of air beneath and to facilitate the application of local remedies to all parts affected. After this the patient did quite well until January 10, 1863, when there was some evidence of an abscess on the anterior part of the thigh, but no distinct fluctuation could be recognized; patient having no pain and feeling quite well, his appetite having returned for some days. The quinine was now stopped and brandy and tonics were continued. On January 14th an extensive abscess was opened on the anterior part of the thigh and about a quart of pus was evacuated, after which the cavity was syringed with tepid water and a bandage was applied to the entire limb. One week later a solution of zinc was ordered to be used for syringing. Subsequently the patient continued to do well, requiring no treatment, and on February 10, 1863, he was discharged, the walls of the abscess having become adherent and the ulcer nearly cicatrized." The man subsequently re-enlisted in the 1st Delaware Cavalry and served for fifteen months, when the wound reopened. He then passed through various hospitals, being ultimately discharged for disability, from Jarvis Hospital, Baltimore, June 15, 1865, and pensioned. Examiner I. Jump, of Dover, Delaware, certified July 1, 1871: "There is a large open sore some four or five inches long and the skin or flesh on most of the leg is very much discolored, the discharge being very offensive except when counteracted by disinfectants. The pensioner had to take to his bed last February, being unable to bear any weight on the limb and suffering very much with it. His physician, who had served in the army, insisted on taking the leg off. I am of the opinion that it never will be healed; but I have advised that the diseased portions of the bones be removed; it is barely possible he may

FIG. 318.—Posterior and anterior views of the bones of the right leg. *Spec.* 6569.

FIG. 319.—Appearance of stump. [From a photograph.]

recover." Dr. J. F. M. Forwood, of Chester, Pennsylvania, who subsequently, on August 19, 1872, amputated the leg seven inches below the knee joint, communicated, in connection with the case, that after receiving his final discharge from service the man "roamed about and had one or two operations performed for his relief, staying some fifty days in St. Joseph's Hospital, Philadelphia, and finally drifting here, where I amputated his limb." At an examination of the stump in August, 1879, Examiner Jump reported: "There has been ulceration for ten months continuously, sometimes confining him to his bed." The pensioner was paid March 4, 1881. The amputated bones of the leg (*Spec.* 6569), together with a photograph of the pensioner, represented in the wood-cuts (FIGS. 318, 319), were contributed to the Museum by the operator.

CASE 793.—Private W. Holmes, Co. D, 18th Massachusetts, aged 20 years, was wounded in the right leg, at Fredericksburg, December 13, 1862. He passed from a field hospital to Campbell Hospital, Washington, two weeks after receiving the injury, and six months afterwards he was transferred to Mower Hospital, Philadelphia. Surgeon J. Hopkinson, U. S. V., in charge of the latter, recorded the following history: "The patient was suffering from a compound comminuted fracture of the tibia and fibula at the lower third. He also complained of diarrhœa, for which chalk mixture and laudanum were administered. Dead bone was discovered by the probe. The leg had been operated on and several pieces of bone removed. At the time of admission, June 20th, it was very much enlarged and disfigured by cicatrices. The wound was dressed with warm-water poultices every hour. On July 15th a large ulcer had broken out on the limb and a large piece of bone was taken away. Warm-water dressings were still continued, and the foot was kept elevated. On the following day the ulcer was found to be extending, and bread and milk poultices were ordered to be applied. Subsequently chlorate of potassa and muriatic disinfecting lotion were used. On July 19th, creasote was applied to the ulcer; warm-water dressings continued; bone now in a sad state. On July 22d the leg was removed by flap operation by Assistant Surgeon C. R. Greenleaf, U. S. A., half way between the ankle and the knee. The flaps were brought accurately together and dressed with water dressing. On the following day the patient felt easy, having slept well during the night after taking a half grain of morphia; pulse 100, full and soft. On July 26th the dressing was removed; stump looking well and patient doing well. Extra diet was given, and porter daily. The stump healed rapidly and the patient's general health was excellent. On September 30th the stump had entirely healed and the patient went home on furlough." He was subsequently transferred to Haddington Hospital, and later to Ladies' Home, New York City, where he was supplied with an artificial leg of the "Bly" pattern, and whence he was discharged April 12, 1864, and pensioned. In his subsequent applications for commutation he described the condition of the stump as continuing in a "healthy state." The amputated bones of the leg (*Spec.* 2594), contributed by the operator, are represented in the annexed wood-cut (FIG. 320) and exhibit the seat of the fracture, the fibula being firmly consolidated, and much callus being effused about the tibia, but caries having prevented firm union. The pensioner was paid March 4, 1881.

FIG. 320.—Bones of the right leg seven months after fracture. *Spec.* 2594.

CASE 794.—Private *E. Collins*, Co. A, 3d Mississippi, aged 22 years, was wounded above the right ankle, at Peach Tree Creek, July 20, 1864. He was under treatment at Confederate hospitals until June 7, 1865, when he was admitted to the Marine (Union) Hospital at Mobile. Surgeon S. Kneeland, U. S. V., in charge, contributed the specimen (No. 481), represented in the adjoining cut (FIG. 321), with the following description: "The missile, a minié ball, perforated the tibia in its course and lodged in the wounded man's shoe. The wound had never healed, and suppuration and hæmorrhage had continued up to the time of the patient's entrance into this hospital. For the last few weeks hæmorrhage had been frequent and profuse and it was with difficulty controlled by stuffing the cavity in the tibia, which was large enough to allow the finger to be introduced freely. Suppuration was also profuse, and there was great pain and swelling about the lower part of the tibia, the patient being considerably exhausted from these causes. Circular amputation of the leg near the middle was performed on June 8th by Acting Assistant Surgeon R. W. Coale, chloroform being used. The stump at first was disposed to slough, but under a tonic treatment and antiseptic applications it soon assumed a healthy appearance. The subsequent progress was favorable, and by June 30th the stump was nearly well." The records of the hospital show that the patient was discharged on parole July 9, 1865. The specimen comprises the lower portions of the bones of the injured leg, and exhibits the cavity in the tibia as well as external deposit of callus.

FIG. 321.—Bones of the right leg ten and a half months after injury. *Spec.* 481.

CASE 795.—Private P. Larkin, Co. C, 48th New York, aged 24 years, was wounded during the assault on Fort Wagner, July 18, 1863, by a canister shot, which fractured the right foot. Assistant Surgeon J. E. Semple, U. S. A., reported that the wounded man was conveyed to hospital at Hilton Head, where Pirogoff's amputation at the ankle joint was performed one week after the date of the injury. The patient recovered, and was discharged from service December 4, 1863, and pensioned. Dr. E. D. Hudson, of New York City, who supplied the pensioner with an artificial foot several years afterwards, reported that he saw the man some weeks after leaving the service and found that the tibia was extensively necrosed, that numerous pieces had exfoliated, and that there was copious discharge of pus from the leg, which was enlarged about one-third beyond its normal size, an involucrum being present corresponding to the extent of the necrosed bone, and several cloacæ having formed. The pensioner subsequently suffered re-amputation of the leg at the middle third (near the junction with the upper third) at the Soldiers' Home in Hampton, whence Dr. G. H. Marmion, surgeon in charge, described the case substantially as follows: "After receiving his discharge Larkin was sent to his home in Brooklyn, where he followed his trade as stucco-maker, but was com-

FIG. 322. — Bony stump of right leg, after Pirogoff's amputation at the ankle joint. *Spec.* 6913.

pelled to desist three months afterwards, necrosis setting in and continuing pretty much up to the present time. He is a man of apparently good constitution, and should have done well had the leg been amputated at the junction of the middle and lower thirds. As it was he led a life of suffering and mortification, the odor of his leg completely ostracising him from the society of his fellows. I think the operation of Syme or Pirogoff might be profitably abandoned. The re-amputation was performed by me on May 6, 1879, with the assistance of hospital nurses, none of them being professional men. The stump was kept constantly wet night and day with a dilute solution of carbolic acid. It healed entirely by first intention, and the patient is now (June 10, 1879) able to walk on crutches a few yards to the hospital piazza. I had some fears of an extension of the disease, but at present there is not nor has there been any indication of the remainder of the tibia being involved. The patient is in excellent physical condition, fat, rosy, and good spirits." The bones of the leg (*Spec.* 6913), removed at the re-amputation and contributed by the operator, are shown in the wood-cut (FIG. 322 on the preceding page), and exhibit a large involucrum embracing a cylindrical sequestrum of the tibia. The pensioner was paid March 4, 1881.[1]

CASE 796.—Private L. V. Grant, Co. M, 8th Illinois Cavalry, aged 23 years, was wounded in the left ankle, at Beverly Ford, June 9, 1863, and entered Lincoln Hospital, Washington, the following day. Assistant Surgeon J. C. McKee, U. S. A., who amputated the injured limb, reported as follows: "The wound was caused by the ball entering the inner malleolus posteriorly, penetrating the base of the tibia, and remaining embedded on the semi-cylindrical face of the astragalus. Upon taking charge of the hospital (December, 1863) I found the patient's condition as follows: Appetite capricious but well guarded by taking acceptable food; constant pain in left breast, accompanied by headache; eyes constantly suffused and face flushed, wakefulness, restlessness, and night-sweats; also a strong aortic direct murmur of the heart, with considerable hypertrophy and consequent labored heart action. He had to be propped up in bed to allow him any rest, his expression being anxious, appetite declining, pain of wound unremitting and excruciating, tissues inflamed and œdematous, and the joint immovable and firmly anchylosed, rendering it impossible for the patient to put his foot on the ground. He begged again and again to have the limb removed. An examination by the probe indicated diseased bone or foreign substance. The opinion of Acting Assistant Surgeon W. F. Peck—under whose care he had been for some months—as confirmed by the statement of the patient was that the ball had been extracted. Uninfluenced by the patient's constant and urgent solicitation I proceeded carefully to examine the case further; and not being satisfied that I had sufficient authority to remove the diseased and injured joint by amputation, I delayed for accumulative evidence, which was not long in presenting itself. The bad symptoms increasing, it became evident that some measure for relief must be promptly taken to save the life of the patient. Assistant Surgeon R. Bartholow, U. S. A., under whose care the patient had also been for some time, favored immediate amputation, and stated that he had intended to operate before my arrival. Assistant Surgeon H. Allen, U. S. A., was also present and favored the operation. Acting Assistant Surgeon W. F. Peck insisted upon removing the limb some time before I gave my consent; other medical gentlemen present were satisfied that the removal of the limb was called for to rid the patient of a deformity and an encumbrance. Amputation was accordingly performed on December 7, 1863, eight inches below the knee, by circular operation. Sulphuric ether was used and the patient reacted promptly. The stump was left laying open on a pillow and strapped, when the healing process commenced. Simple water dressings were applied. The aggravated symptoms of the heart disease became greatly modified after the operation. The patient's appetite improved, his night-sweats ceased, and he was delighted to be able to sleep and rest, stating that he had not enjoyed any comfort or relief from pain for months before. He obtained an excellent and useful stump. The ligatures came away two weeks after the operation. The patient was furloughed February 11th, and subsequently he was transferred to Judiciary Square Hospital to have an artificial limb applied." On September 24, 1864, his term of service expired and he was mustered out. He was a pensioner until August 21, 1865, when he died. The cause of his death has not been ascertained. The amputated part of the wounded limb, longitudinally bisected and exhibiting the place of lodgement of the missile, was contributed to the Museum by the operator and constitutes specimen 1899 of the Surgical Section.

Fatal Cases of Secondary Amputations in the Middle Third of the Leg for Shot Injury.—Thirty-seven operations were performed—six on Confederate and thirty-one on Union soldiers. Erysipelas was noted in one, pyæmia in seven, and gangrene in eleven cases; in two instances autopsies were reported.

CASE 797.—Private D. Bussler, Co. K, 93d Pennsylvania, aged 19 years, was wounded near the left ankle during the engagement near Fort Fisher, before Petersburg, March 25, 1865. Surgeon S. F. Chapin, 139th Pennsylvania, reported his admission to the field hospital of the 2d division, Sixth Corps. Assistant Surgeon H. Allen, U. S. A., contributed the pathological specimen, numbered 195 of the Surgical Section, A. M. M., with the following description and result of the injury: "The wound consisted of a compound comminuted fracture of the fibula; a conoidal ball had entered the outer aspect four inches above the external malleolus, and emerged at the inner aspect one and a half inches above the internal malleolus. The patient was admitted to Mount Pleasant Hospital, Washington, one week after receiving the injury. Circular amputation of the leg was performed by Acting Assistant Surgeon H. Craft, on May 6th, at the junction of the middle and lower thirds. Eight ligatures were applied and sulphuric ether was used. At the time of the operation the leg presented a large open surface on the posterior region, extending from one inch below the ankle joint to the junction of the middle and lower thirds of the limb. Several spiculæ had been removed previously and there had been gangrene; the patient had lost his appetite and was very weak; pulse small. Reaction came on slowly. On the evening of May 9th he had a severe chill; suppurative process not yet established; stump dark looking and flaps somewhat discolored; two ligatures now came away. Tincture of chloride of iron, with stimulants and nourishing diet, were prescribed, also a camphor and opium pill every liquid stool. On the following day there was another chill, followed by profuse cold sweat; previous treatment continued, and one-half drachm of bi-sulphate of soda dissolved in water was given every two hours. There was very little discharge from the stump, which was dressed with solution of bromine. On May 11th there were two chills and the treatment was continued. In the evening the bi-sulphate of soda was

[1] SMITH (S.), *Amputations at the Ankle Joint in Military Surgery*, in *U. S. Sanitary Commission Memoirs*, Surgical Volume II, p. 134.

stopped, but resumed the next morning. Several rigors occurred during the night and a slight chill on the morning of May 13th, when the patient had great pain in the stomach, and the bi-sulphate of soda was again stopped and morphia prescribed. In the afternoon the doses of bi-sulphate of soda were again resumed. He suffered great pain in the stomach through the night, and the next day the remedy was again stopped. There were now symptoms of gastritis and the patient was gradually sinking. The slough had all separated from the stump, which looked quite healthy. Poultices of charcoal, flaxseed, yeast, and creasote had been used for several days. On the morning of May 15th the patient was very low and in a dying condition, and all medicines except stimulants and beef-essence were stopped. Death, caused by pyæmia, supervened at 3 P. M. on May 15, 1865. At the autopsy the thoracic viscera were found to be normal with the exception of old adhesions of the right lung. The left lobe of the liver and the spleen contained metastatic abscesses; other abdominal viscera were normal. The stump was in a gangrenous condition. The medulla of the upper third of the femur was greatly inflamed, particularly so about one inch below the great trochanter; cancelli of upper part of femur very vascular; cancellous structure of tibia slightly vascular." The specimen consists of the amputated portion of the fibula, showing the seat of the injury without any attempt at repair.

CASE 798.—Sergeant J. C. Schmid, Co. F, 1st Rhode Island Light Artillery, aged 26 years, was wounded, before Petersburg, August 10, 1864, by a minié ball, which took effect above the malleoli of the left leg and implicated the bone. He was admitted to Satterlee Hospital, Philadelphia, one week after receiving the injury. By September 2d the wound had become gangrenous and was sloughing a little, the muscles and bone being exposed at the point of the injury. The patient was thin looking but apparently of good strength and constitution, having good appetite and being in good spirits. The wound became very large and deep, involving most of the muscular structure on the inner and posterior surfaces and extending from the internal malleolus to within two inches of the point of election. On September 22d the leg was amputated by Acting Assistant Surgeon G. P. Sargent just above the point of election, by the circular method, the anæsthetic consisting of two parts of ether to one part of chloroform. One week after the operation the patient's condition was weak and his appetite poor, and there was unhealthy inflammation. On October 6th there was gangrene of the stump, the swelling, inflammation, and discolored spots extending to the groin. The patient died at noon on October 7, 1864, having suffered much pain the previous night. The treatment embraced morphine, quinine, iron, and stimulants according to the condition of the patient. Astringent lotions, caustics, and cataplasms of charcoal and linseed meal were used to the wound and lead and opium solution to the thigh. A mixture consisting of one drachm of carbonate of ammonia, two ounces of syrup of acacia, and six ounces of brandy was administered in tablespoonful doses every four hours. The history, together with the amputated portion of the bones of the leg (represented in the annexed wood-cut, FIG. 323), was contributed by the operator. The specimen, No. 3647, shows that the tibia was nearly entirely fractured in the lowest third, a deposit of callus around the orifice, and an extensive loss of substance in the body of the bone, which is carious.

FIG. 323.—Lower portions of bones of the left leg one month and twelve days after injury. *Spec.* 3647.

CASE 799.—Sergeant J. Cannel, Co. I, 124th Ohio, aged 27 years, was wounded near Dalton, May 9, 1864. Surgeon R. D. Lynde, U. S. V., reported his admission to the field hospital of the 3d division, Fourth Corps, with "shot fracture of right leg and flesh wound of left leg." Eighteen days after receiving the injury the patient was transferred to hospital No. 1 at Nashville, whence Surgeon R. L. Stanford, U. S. V., reported the following: "The wound of the right leg was three-fourths of an inch above the external malleolus and posterior to the tibia, the ball passing inward and downward and emerging three-fourths of an inch below the internal malleolus, having fractured tarsal bones and opened the ankle joint. Circular amputation of the leg at the middle third was performed on June 11th by Acting Assistant Surgeon H. C. May, chloroform and ether being used. At the time of the operation the foot was tumefied and inflamed and the wounds were discharging sanious fetid pus. Abscesses existed through the whole region of the joint, with extensive necrosis of bone, and the patient was much emaciated by suppuration. Thirty-six hours after the amputation the integumentary flaps began to slough so as to expose the bones and face of the stump. Charcoal and yeast poultices were used and stimulants and supporting diet prescribed." The patient died of exhaustion October 4, 1864. Part of the tarsal bones of the amputated limb, somewhat eroded and showing no attempt at repair, were contributed to the Museum by the operator and constitute specimen 3359 of the Surgical Section.

TABLE LXXVII.

Summary of One Hundred and Seventy-four Secondary Amputations in the Middle Third of the Leg for Shot Injury.

[Recoveries, 1—137; Deaths, 138—174.]

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.	NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Ash, W., Pt., I, 15th Ohio, age 19.	Sept. 20, Dec. 18, 1863.	Right; circ. Surg. W. C. Otterson, U. S. V. Gangrene. Discharged July 25, 1864.	6	Bassett, A., Pt., H, 22d Massachusetts.	Oc.18,'63, Nov. 29, 1865.	Left; circular. Dr. W. Green, Pittsfield, Mass. Recovery.
2	Babb, L., Pt., B, 5th N. Hampshire, age 43.	April 7, Aug. 12, 1865.	Right; flap. Ass't Surg. G. M. McGill, U. S. A. Discharged October 5, 1865.	7	Bell, J. A., Pt., I, 22d Indiana.	De.31,'62, Dec. 17, 1863.	Left; flap. Discharged November 24, 1863.
3	Baker, J., Pt., K, 4th Penn. Reserves.	June 30, Au. 2,'62.	Right; circ. Discharged September 26, 1863.	8	Bell, O. L., Pt., D, 1st Delaware, age 19.	Sept. 17, 1862. Aug. 19, 1872.	Right. Dr. J. F. M. Forwood, Chester, Penn. (Dec., 1862, limb united; erysipelas. Discharged Feb. 10, 1863.) Two subsequent operations. *Spec.* 6569.
4	Ball, T., Corp'l, B, 54th New York, age 23.	July 4, Sept. 26, 1864.	Right; anterior posterior skin flap. A. A. Surg. W. Balser. Disch'd June 24, 1865.				
5	Barnett, B. W., Pt., E, 3d New York Light Artillery, age 19.	May 16, Aug. 15, 1864.	Right; double flap. A. A. Surg. E. Seyffarth. Discharged February 16, 1865.	9	*Bennett, F.*, Pt., G, 57th Virginia.	July 3, Aug. 18, 1863.	——. Surg. — Carter. Recovery.

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
10	Blood, J. N., Pt., C, 16th Massachusetts.	July 3, Aug. 27, 1863.	Left; antero-posterior flap. A. A. Surg. F. Hinkle. Disch'd May 3, 1864. *Spec.* 1712.
11	*Boggs, P. F.*, Pt., A, 1st N. Carolina Cavalry.	July 3. Aug. 27, 1863.	Left. A. A. Surg. B. H. Washington, C. S. A. Recovery.
12	Brown, T. D., Pt., K, 95th Illinois.	May 22, June 27, 1863.	Left; circular. Surg. C. T. Alexander, U. S. A. (May 25, amp. toes.) Disch'd Aug. 12, 1863.
13	*Bugg, W. T.*, Serg't, B, 3d Arkansas.	July 4, Aug.8,'63.	Right. Recovery.
14	Buisch, G., Pt., C, 160th New York, age 44.	Se.16,'64, Jan. 28, 1865.	Left; oval flap. A. A. Surg. A. Trau. Disch'd May 31, 1865. Died July 31, 1876; chr. diarrh.
15	Burbank, B., Pt., H, 95th New York, age 22.	Jan. 13, April 3, 1863.	Left; flap. Ass't Surg. J. Homans, jr., U. S. A. Disch'd June 2, 1863. Died Sept. 17, 1868.
16	Campbell, J. N., Pt., G, 2d Michigan Cavalry, age 32.	Nov. 30, 1864, May 22, 1865.	Left; circular. Ass't Surg. G. M. Sternberg, U. S. A. Discharged July 17, 1865.
17	Campbell, S., Pt., G, 26th Illinois, age 22.	May 9. July 10, 1862.	Left; flap. Discharged October 13, 1862. Died April 17, 1870.
18	Carter, A. L., Lieut., B, 76th New York.	July 1, 1863, April 13, 1865.	Right; long posterior flap. Dr. F. Hyde, Cortland, N. Y. (Discharged November 9, 1863.)
19	Chellis, J. C., Pt., B, 41st Ohio, age 43.	Nov. 25, 1863, Jan. 7, 1865.	Right; antero-posterior flap. A. Surg. G. M. Sternberg, U. S. A. (Necrosis.) Disch'd May 18, 1865. *Spec.* 3607.
20	Clinger, I. W., Pt., I, 26th Ohio, age 20.	Dec. 27, 1862, Dec. 18, 1863.	Right; antero-posterior flap. A. A. Surg. J. Q. A. Banta. Discharged April 10, 1864.
21	*Collins, E.*, Pt., A, 3d Mississippi, age 22.	July 20, 1864, June 8, 1865.	Right; circular. A. A. Surgeon R. W. Coale. (Hæmorrhage.) Paroled July 9, 1865. *Spec.* 481.
22	Covert, B. C., Pt., B, 67th New York.	June 1, July 11, 1862.	Right; circ. Discharged September 7, 1862.
23	Cowling, J. R., Pt., A, 62d Pennsylvania, age 21.	July 2, 1863, Sept. 21, 1864.	Right. Surg. J. Kerr, 62d Penn. (Primary excis. tibia. Disch'd July 13, 1864.) Recovery.
24	Crawford, L. M., Corp'l, M, 13th Pennsylvania Cavalry, age 25.	Aug. 14, Dec. 23, 1864.	Right; circular. Surg. A. F. Sheldon, U. S. V. Discharged June 19, 1865. *Spec.* 3536.
25	Currin, O., Pt., A, 63d New York, age 50.	Sept. 17, Oct. 20, 1862.	Right; circular. Discharged January 12, 1863.
26	Davis, T. F., Pt., E, 82d Pennsylvania, age 24.	June 1, Dec. 14, 1864.	Left; flap. A. A. Surg. A. Trau. Discharged April 29, 1865.
27	Dellabella, F., Pt., D, 2d Missouri, age 28.	Sept. 20, 1863, Mar. 21, 1864.	Right; circular. Medical Cadet C. H. Fisher. (Gangrene; hæmorrhage.) Discharged October 7, 1864. *Spec.* 2205.
28	Dougherty, A., Pt., D, 44th Indiana.	April 6, June 25, 1862.	Left; flap. A. A. Surg. T. B. Harvey. (Erysipelas.) Disch'd September 12, 1862.
29	Douglas, A. L., Pt., H, 2d Maine.	July 21, Aug. 21, 1861.	Right; flap. Discharged October 5, 1861.
30	[1] Duffy, T., Pt., I, 70th New York, age 21.	June 1, 1862.	Left; posterior flap. (Primary amp. ankle joint. Gangrene.) Disch'd July 11, '63. *Spec.* 4312.
31	Dunn, T., Fireman, U.S. Steamer "Juliet," age 26.	April 26, June —, 1864.	Left. Discharged October 24, 1864.
32	Duran, J., Corp'l, C, 17th Maine, age 38.	May 6, Aug. 28, 1864.	Left; circular. A. A. Surg. G. E. Brickett. May 18, 1865, amp. thigh. Disch'd August 7, 1865.
33	Duran, J., Pt., D, 1st Maine Cavalry, age 48.	Oc.27,'64, April 30, 1865.	Left; circular. Discharged August 12, 1865. *Spec.* 4231.
34	Fagan, P., Pt., B, 170th New York, age 41.	June 18, Aug. 10, 1864.	Left; flap. A. A. Surg. G. W. Miller. (Primary amp. toes. Gangrene.) Discharged May 22, 1865. *Spec.* 3664.
35	Ferguson, E., Lieut., A, 1st Wisconsin.	Oct. 8, 1862, June 15, 1863.	Right; flap. Drs. T. Hatchard and E. B. Wolcott, of Milwaukee. Resigned June 17, 1864.
36	Fleming, A. J., Pt., I, 83d Pennsylvania, age 45.	June 27, July 28, 1862.	Left; flap. A. A. Surg. A. W. Calhoun. Discharged December 8, 1862.
37	Gamble, J., Pt., C, 15th West Virginia, age 23.	July 21, Oct. 12, 1864.	Right; lateral flap. Ass't Surg. G. M. McGill, U. S. A. Disch'd April 16, 1866. *Spec.* 2415.
38	*Gash, J. R.*, Serg't, I, 16th North Carolina.	July 1, Sept. 10, 1863.	Left. Surg. Massengale, C. S. A. Recovery.
39	Goode, S., Pt., K, 12th Virginia Cavalry.	Oct. 12, Nov. 12, 1863.	——. Surg. — ———, 9th N. Y. Recovery.
40	Grant, L. V., Pt., M, 8th Illinois Cavalry, age 23.	June 9, Dec. 7, 1863.	Left; circular. Ass't Surg. J. C. McKee, U. S. A. Discharged Sept. 24, 1864. Died August 21, 1865. *Spec.* 1899.
41	Griebe, J., Pt., E, 9th Wisconsin.	Sept. 30, Oct. 31, 1862.	Right; flap. Surg. H. Buckmaster, U. S. V. Discharged January 8, 1863.
42	Grieff, C. H., Pt., A, 96th Pennsylvania, age 21.	June 26, Aug. 1, 1862.	Left; circular. A. A. Surg. S. D. Gross. Erysipelas; hæmorrh. Discharged Dec. 5, 1863.
43	Grier, W., Pt., K, 2d Maine, age 38.	June 27, Aug. 21, 1862.	Left. Discharged November 1, 1864. Died August 25, 1865.
44	Grimes, M., Pt., A, 16th Kentucky, age 21.	May 28, June 29, 1864.	Right; lateral skin flap. Surg. C. McDermont, U. S. V. Disch'd April 1, 1865.
45	Griswold, D. P., Corp'l, C, 76th New York.	J'y 1, '63, May 11, 1869.	Left; flap. Dr. J. D. Trips, Virgil, N. Y. (July 5, excis. tibia. Disch'd Sept. 23, 1864.) Rec.
46	*Growner, H. L.*, Serg't, A, 20th North Carolina, age 33.	Sept. 14, Oct. 18, 1862.	Left. Exchanged December 20, 1862.
47	Hafer, W. H., Pt., E, 2d Pennsylvania Cavalry, age 24.	De.31,'63, Aug. 4, 1864.	Right; flap. Surg. S. P. Smith, 2d Maryland P. H. B. Disch'd April 10, 1865.
48	Hendricks, H., Pt., D, 49th Pennsylvania, age 18.	May 10, 1864, Feb.3,'65.	Right; circular. A. A. Surg. A. Transue. Discharged May 22, 1865.
49	*Henry, W. R.*, Pt., H, 38th Georgia.	De.13,'62, Feb.3,'63.	——. Recovery.
50	*Higinton, J. T.*, Pt., K, 10th Tennessee, age 18.	July 4, Aug. 30, 1864.	Left; circular. To Provost Marshal November 16, 1864.
51	Holmes, W., Pt., D, 18th Massachusetts, age 20.	Dec. 13, 1862, J'y 2, '63.	Right; flap. A. Surg. C. R. Greenleaf, U. S. A. Discharged April 12, 1864. *Spec.* 2594.
52	Horine, W. T., Serg't, K, 20th Indiana.	July 2, Aug. 13, 1863.	Right; flap. Surg. Z. E. Bliss, U. S. V. Discharged July 29, 1864.
53	House, C., Pt., K, 60th Ohio.	Sept. 15, Oct. 16, 1862.	Left; flap. Discharged.
54	Houser, W., Pt., D, 5th Cavalry, age 29.	June 27, Aug. 3, 1862.	Left; flap. A. A. Surg. S. D. Gross. Discharged August 8, 1863.
55	Howe, S. O., Pt., K, 57th Massachusetts.	Mar. 25, June 8, 1865.	Left; circular. Surg. D. W. Bliss, U. S. V. Discharged August 4, 1865.
56	Hubbard, A., Farrier, D, 6th New York Cavalry, age 32.	July 22, Sept. 2, 1864.	Left; antero-posterior flap. A. A. Surg. W. K. Cleveland. Jan. 1, 1865, amp. thigh. Disch'd November 7, 1865. *Spec.* 278.
57	Hudler, J. M., Pt., D, 4th Michigan, age 31.	July 2, Aug. 5, 1863.	Left; sloughing; exfoliat'n. Discharged May 27, 1864.
58	Ingraham, E., Pt., I, 21st Ohio, age 21.	Sept. 20, Dec. 14, 1863.	Right; flap. Ass't Surg. J. C. Patterson, 85th Ill. Discharged June 20, 1864. Died May 3, 1871; consumption.
59	*Jones, J. F.*, Pt., D, 7th Virginia, age 29.	July 3, Au. 4,'63.	Left; flap. Surg. — Shivers, C. S. A. Exch'd Nov. 12, 1863.
60	Jones, J. W., Pt., L, 13th Tennessee Cav'ry, age 21.	Oct. 28, Dec. 24, 1864.	Left; anterior posterior flap. Discharged June 10, 1865.
61	Kasher, J. A., Pt., G, 145th Penn., age 24.	Dec. 13, 1862, Mar. 26, 1863.	Right (erysipelas). Discharged March 25, 1864.
62	Kelley, W., Pt., M, 1st N. York Cavalry, age 38.	April 8, May 13, 1865.	Right; lateral flap. Ass't Surg. J. W. Williams, U. S. A. Discharged August 14, 1865.
63	*King, S. S.*, Pt., G, 13th South Carolina.	July 3. Aug. 24, 1863.	Right; flap. A. A. Surgeon G. Martin. Exchanged March 17, 1864. *Spec.* 2071.
64	Lackey, G. A., Serg't, D, 58th Massachusetts.	May 12, July 27, 1864.	Left; flap. (May 27, amp. foot.) Dr. C. E. Swann, Easton, Me. Discharged March 16, 1865.
65	Lane, D. C., Pt., A, 20th Massachusetts, age 37.	June 30, 1862, Jan. 2, 1863.	Left. A. A. Surg. C. J. Morton. Jan. 2, hæm. Disch'd August 1, 1864. Re-amp. Died Jan. 20, 1866; pyæmia. *Spec.* 861.
66	Larkin, P., Pt., C, 48th New York, age 24.	July 18, 1863, May 6, 1879.	Right. Dr. G. H. Marmion. (July 25, 1863, Pirogoff's amp. ankle. Discharged December 4, 1863. Necrosis.) *Spec.* 6913.
67	Laws, G. L., Serg't, H, 5th Wisconsin.	May 5, July 4, 1862.	Left. Ass't Surg. R. Bartholow, U. S. A. Discharged July 29, 1862.
68	Leigh, G., Pt., C, 3d Artillery, age 19.	Sept. 24, 1863, Mar. 29, 1864.	Right; double flap. Surg. J. A. Lidell, U.S.V. (Prim. amp. ank. joint.) Disch'd Sept. 17, 1864. Died Sept. 13, 1871. *Spec.* 2165.

Secondary Amputations in the Lower Third of the Leg for Shot Injury.—The number of secondary operations in the lower third of the leg is one hundred and twenty-one; eighty-six patients survived the operation and thirty-five, or 28.9 per cent., succumbed. The right limb was amputated in fifty-five, and the left in sixty-two instances; in four cases the side was not specified.

Recoveries after Secondary Amputations in the Lower Third of the Leg.—Of the eighty-six operations of this group nine were performed on Confederate and seventy-seven on Union soldiers. The latter were pensioned, and one only has died since the date of discharge from the service.

Case 800.—Private W. Nash, Co. C, 187th Pennsylvania, aged 19 years, was wounded in the right foot, before Petersburg, June 18, 1864. Surgeon C. N. Chamberlain, U. S. V., reported his admission to the field hospital of the 4th division, Fifth Corps, with "severe injury to the bones of the foot, caused by a minié ball." From the field hospital the wounded man passed to City Point, thence to hospital at Alexandria, and subsequently to Philadelphia. Assistant Surgeon T. C. Brainerd, U. S. A., in charge of Broad and Cherry Streets Hospital, described the injury as "a compound fracture of the tarsus, followed

by necrosis of bone, pain in the foot, and free discharge, for which the leg was amputated at the lower third by circular method, on May 8th, by Acting Assistant Surgeon H. M. Bellows. At the time of the operation the patient had become much exhausted from the profuse and continued discharges from the wound. He reacted promptly, ether having been used as an anæsthetic. Dry dressings were applied." The operator subsequently communicated that the stump only required three weeks to heal perfectly. The patient afterwards passed through various hospitals, and was ultimately mustered out at the expiration of his time of service, August 3, 1865, and pensioned. Several years later, when seen and examined by the operator, the pensioner was found in general good health and with a good, round, and entirely healed stump, he being able to walk satisfactorily with the aid of an artificial limb. In his application for commutation, in 1870, the pensioner described the stump as being "not in the best condition;" but in his subsequent statements, five and ten years later, he reported its condition as "good." The pensioner was paid September 4, 1880.

CASE 801.—Private D. Dietz, Co. B, 48th Pennsylvania, aged 21 years, was wounded in the left ankle joint, at Spottsylvania, May 12, 1864. He remained at a field hospital for two weeks and was then conveyed to Washington, where he was admitted to Campbell Hospital. Surgeon A. F. Sheldon, U. S. V., contributed the pathological specimen, No. 4052, represented in the annexed wood-cut (FIG. 324), with the following history of the injury: "A musket ball entered the left foot posteriorly, passed forward between the astragalus and tibia, and emerged anteriorly, opposite the point of entrance, fracturing the articulating surfaces of both bones. Circular amputation through the inferior third of the leg was performed by Assistant Surgeon A. Delany, U. S. V., on November 10th, two ligatures being applied and anæsthesia produced by chloroform. At the time of the operation the foot and ankle were enlarged, with numerous openings discharging sanguinolent pus. Hectic irritation, pain, and loss of appetite were rapidly overcoming what little vitality remained. The patient bore the operation well." The patient was subsequently transferred to Judiciary Square Hospital for the purpose of being fitted with an artificial limb, and on May 19, 1865, he was discharged from service and pensioned. In his application for commutation, dated 1870, he described the stump as "healed and well," and subsequently he reported it as being in "good condition." The pensioner was paid June 4, 1880. The specimen consists of the bones comprising the ankle of the amputated leg, and shows that large quantities of spongy new bone were thrown out around the tibia, but the bodies of the bones were destroyed by suppuration.

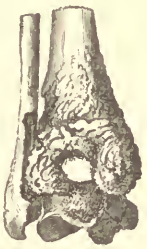

FIG. 324.—Bones of the left ankle six months after injury. *Spec.* 4052.

CASE 802.—Private C. W. Fox, Co. I, 111th New York, aged 18 years, was wounded in the right foot during the engagement at the South Side Railroad, March 31, 1865. He was admitted to Harewood Hospital, Washington, five days afterwards, where amputation was performed by Surgeon R. B. Bontecou, U. S. V., who made the following report: "The metatarsal bone of the big toe was fractured and the os calcis severely injured. When admitted the patient appeared to be considerably debilitated; the condition of the injured parts, however, was tolerably good. The parts subsequently became gangrenous, with disorganization of the ankle joint, sloughing of soft parts, and necrosis of bone. Sinuses formed and extended up the leg. The limb was amputated at the lower third by the circular method on May 3d. The patient did well after the operation under simple dressings, aided by a supporting and nourishing diet throughout. The parts had nearly healed when he was transferred to Armory Square Hospital July 20th." About one month later he was transferred to Stanton Hospital, where a second operation became necessary and was performed by Surgeon B. B. Wilson, U. S. V., who describes it as follows: "The first amputation had been performed about one inch above the ankle joint. At the time of the patient's admission to Stanton Hospital the stump had entirely healed, but it was swollen and painful and presented evidence of suppurative inflammation within. Poultices were applied and abscesses soon pointed in two or three places, one in or near the cicatrix of the operation and the others along the lower part of the shaft of the tibia, which, on rupturing, discharged a bloody and ill-conditioned pus pretty freely. Upon examination with a probe the existence of necrosed bone was detected, and at the earnest request of the patient, who desired to get rid of his trouble as quickly and fully as possible, it was determined to re-amputate the stump as far as the sequestrum extended. The operation was performed on September 6th, three inches of the bones being removed by the ordinary circular method and the sequestrum found to extend quite up to the point severed by the saw. The integument was brought together laterally and secured by interrupted sutures and adhesive straps. The patient did well and the healing process progressed rapidly. At the closing of Stanton Hospital, on September 19th, he was sent to Douglas Hospital, where I saw him two weeks afterwards, when the stump was almost entirely healed and looked admirably." In October, 1865, the patient was discharged from service, to date from September 6th, and pensioned, having been previously supplied with an artificial leg. In his applications for commutation he described the stump as being in "sound" and "good condition." His pension was paid September 4, 1880. The bones removed at the second amputation were contributed to the Museum by the operator and constitute specimen 2454 of the Surgical Section, exhibiting the fibula in a state of caries and a large spongy involucrum surrounding a small sequestrum of the tibia.

Fatal Secondary Amputations in the Lower Third of the Leg for Shot Injury.—In the thirty-five cases of this class pyæmia was noted in ten, gangrene in ten, erysipelas in two, and secondary hæmorrhage in one instance. Nine of the patients were Confederate and twenty-six Union soldiers:

CASE 803.—Private *W. J. Craps*, Co. D, 24th South Carolina, aged 33 years, was wounded at Franklin, November 30, 1864, by a musket ball, which entered the external lateral aspect of the left ankle immediately over the malleolus, passed inward, and emerged at the internal aspect in front of the internal malleolus, fracturing the inferior end of the fibula and opening the ankle joint. The man was taken prisoner and admitted to hospital No. 1, at Nashville, four weeks after receiving the injury. The tissues about the ankle joint and dorsum of foot became swollen and infiltrated, which was followed by profuse discharge of carious pus from three fistulous openings. On February 17, 1865, the leg was amputated at the lower third by Surgeon B. B. Breed, U. S. V. The operation was performed by bi-lateral skin flaps and circular section of muscles, two ounces of blood

being lost and three ligatures applied. Chloroform was used and was followed by prompt reaction. At the time of the operation the patient was much exhausted and suffering from obstinate diarrhœa. Disinfectant dressings were used, also tonics, stimulants, and supporting diet. The patient died of exhaustion March 11, 1865. The tarsal and metatarsal bones of the amputated limb, contributed with the history by the operator, constitute specimen 4217 of the Surgical Section of the Museum. The internal and middle cuneiform bones are wanting in the specimen, and the first metatarsal is obliquely fractured.

FIG. 325.—The bones of the right ankle eight months after injury.—*Spec.* 4248.

CASE 804.—Private S. B. Dudley, Co. B, 97th Indiana, aged 24 years, was wounded at Kenesaw Mountain, June 27, 1864. Surgeon J. M. Woodworth, 1st Illinois Light Artillery, reported his admission to the field hospital of the 4th division, Fifteenth Corps, with "shot fracture of right ankle joint." From the field the wounded man was successively transferred to hospitals at Rome, Chattanooga, and Nashville, and lastly, on November 29th, he entered Crittenden Hospital at Louisville, where the injured limb was amputated by Surgeon R. R. Taylor, U. S. V., who made the following report: "The wound was caused by a minié ball, which perforated the joint anteriorly. The injury resulted in anchylosis and inflammation of the ankle joint, and fistulous openings formed around the joint leading to carious bone. The disease, enkindled in the articulation and adjacent parts, became so extensive that amputation had to be performed through the lower third of the leg on February 18, 1865. Chloroform was used and the operation was done by the circular method, the patient being in good general health at the time. Simple dressings were applied, and for a time the case promised well; but in a few weeks the patient was seized with traumatic erysipelas, which rapidly extended over the entire leg and thigh, and in spite of an energetic supporting treatment he sank rapidly. His death occurred February 28, 1865." The bones comprising the injured ankle joint, *Spec.* 4248, were contributed to the Museum by the operator and are represented in the wood-cut (FIG. 325), showing the articulation in a state of anchylosis and exhibiting marked periosteal disturbance in the shafts of the tibia and fibula for several inches. The specimen also reveals the outer border of the calcaneum to have been grooved and the posterior portion of the astragalus to have been carried away.

CASE 805.—Private L. Ordway, Co. A, 19th Maine, aged 33 years, was wounded before Petersburg, June 22, 1864, and entered Broad and Cherry Streets Hospital, Philadelphia, eight days afterwards. Assistant Surgeon T. C. Brainerd, U. S. A., reported: "The injury consisted of a gunshot fracture of the left ankle joint, the ball entering directly over the internal malleolus, fracturing it and a portion of the upper and inner articulating edge of the astragalus. The wound sloughed very badly and the patient became very much emaciated. Amputation was deemed necessary, and was performed by the circular method, at the lower third of the leg, on July 23d, by Acting Assistant Surgeon F. H. Getchell. Chloroform was used. The patient reacted well for one so weak as he was, and the stump looked healthy for two days, after which sloughing set in. Dry dressings were applied and beef-tea, tonics, and stimulants were administered. The patient continued to sink, and died of exhaustion July 28, 1864." The amputated bones of the ankle, carious and showing no attempt at repair, were contributed to the Museum by the operator and constitute specimen 3663 of the Surgical Section.

TABLE LXXVIII.

Summary of One Hundred and Twenty-one Cases of Secondary Amputations in the Lower Third of the Leg for Shot Injury.

[Recoveries, 1—86; Deaths, 87—121.]

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.	NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Allhands, F. M., Lieut., E, 35th Illinois, age 32.	May 11, July 18, 1864.	Right; flap. A. A. Surg. J. H. Green. (Synovitis and erysip.) Discharged January 2, 1865.	10	*Burnett*, W.....	July 4, De.24,'63.	Left (necrosis). Discharged February 7, 1864.
2	*Arnett*, W. W., Pt., I, 14th Miss., age 38.	Dec. 15, 1864, Jan. 20, 1865.	Right; flap. To Provost Marshal May 31, 1865.	11	Burns, C. E., Pt., D, 12th Massachusetts, age 24.	Aug. 29, 1862, April 23, 1863.	Right; double flap. Surg. J. H. Baxter, U. S. V. (Sept. 13, '62, Syme's amputation ankle joint.) Disch'd July 11, 1863.
3	Bailey, D., Pt., G, 3d Iowa Cavalry, age 26.	June 10, 1864, Feb.–,'65.	Right. Dr. J. C. Hughes,—— (Sloughing; ligation plantar.) Discharged Sept. 11, 1865.	12	Burrows, E., Pt., 19th N. Y. Battery, age 31.	May 1, Aug. 25, 1864.	Right; flap. A. A. Surg. E. L. Duer. (May 14, amput'n toe.) Discharged September 23, 1865.
4	Bisbee, N., Serg't, K, 89th New York.	June 18, 1864, Ap. 3, '65.	Right; flap. Surg. A. H. Thurston, U. S. V. (Amputat'n toes.) Discharged May 25, 1865.	13	Burt, F. P., Pt., C, 22d Massachusetts, age 19.	May 8, June 8, 1864.	Right; circular. A. A. Surg. H. B. Knowles. Discharged September 17, 1864.
5	[1]Bralier, H. H., Pt., E, 11th Pennsylvania.	Aug. 30, Oct. 5,'62.	Right; Teale's method (circular). Ass't Surg. C. A. McCall, U. S. A. Oct. 13, re-amputation. Disch'd September 14, 1863. *Spec.* 167.	14	Childers, F., Pt., G, 8th Illinois.	April 6, May7,'62.	Right., Surgeon — Fish. Discharged August 23, 1862.
6	Brinson, J., Pt., G, 38th Indiana, age 42.	Dec.1,'62, Feb. 24, 1863.	Right; flap. Ass't Surg. A. T. Barnes, 98th Illinois. Disch'd May 21, 1863.	15	[2]Connors, J., Pt., F, 76th Pennsylvania, age 25.	July 11, Sept. 27, 1863.	Right; antero-post. flap. A. A. Surgeon J. M. Fulton. (Syme's amp. ankle joint.) Discharged August 28, 1865.
7	Bromley, H., Pt., I, 14th Pennsylvania Cavalry, age 28.	May 28, July 12, 1864.	Right; flap. Discharged January 27, 1865.	16	[3]Covell, E. R., Pt., C, 52d New York, age 38.	May 18, 1864, May5,'69.	Left; flap. Dr. R. Millar, R. I. Hospital. (May 18, '64, Syme's amputation ankle.) *Spec.* 4369.
8	Brouchard, A., Pt., A, 5th New Hampshire, age 31.	April 7, May 15, 1865.	Left; circ. A. A. Surgeon J. M. Downs. (April 17, excision met. bones.) Disch'd Aug. 12, 1865. 1866, amp. knee j't; amp. thigh.	17	Crouse, J., Serg't, I, 1st New York Light Artillery, age 24.	July 2, Aug. 2, 1863.	Left. Discharged May 21, 1864. *Spec.* 1651.
9	Brown, R., Pt., G, 28th New York, age 19.	Aug. 9, Sept. 27, 1862.	Right; circular. A. A. Surg. S. E. Fuller. Disch'd October 23, 1862. *Spec.* 326.	18	Detwiler, M. L., Serg't, A, 30th Illinois, age 24.	Feb. 5, Mar. 22, 1864.	Right; flap. A. A. Surgeon A. Sterling. Discharged August 30, 1864.
				19	Dietz, D., Pt., B, 48th Pennsylvania, age 21.	May 12, Nov. 10, 1864.	Left; circ. Ass't Surg. A. Delany, U. S. V. Discharged May 19, 1865. *Spec.* 4052.

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
20	Donahue, M.C., Seaman, U. S. Gunboat "Baron DeKalb."	Jan. 11, Feb. 11, 1863.	Right. A. A. Surg. G. Bigsby. Discharged April 30, 1863.
21	Eastman, J. E., Serg't, L, 1st Mass. Heavy Artillery, age 39.	May 19, July 8, 1864.	Right; skin flap. A. A. Surg. G. O. Moody. Discharged July 12, 1865.
22	Egan, O., Pt., E, 17th Massachusetts, age 27.	Feb. 1, May 14, 1864.	Left; circular. A. A. Surg. J. B. Cutter. Gangrene. Discharged August 3, 1864.
23	Evans, C., Pt., E, 120th New York.	May 3, J'y —,'63.	Left. Discharged November 16, 1863. *Spec.* 1346.
24	Evans, J., Pt., I, 19th Michigan, age 40.	May 15, June 15, 1864.	Left; circular. Discharged September 13, 1865.
25	Farren, B., Pt., A, 82d Pennsylvania, age 49.	April 8, Oct. 25, 1865.	Right; circular. A. A. Surg. J. B. Roe. Recovered February 22, 1866.
26	Finegan, P., Pt., H, 16th Infantry, age 34.	Dec. 31, 1862, Feb. —, 1866.	Right. Dr. J. H. Armsby. (Discharged Feb. 21, 1865; chronic erysipelas of foot. 27th, partial amputation of foot.)
27	Foster, T. J., Pt., H, 140th Penn., age 21.	May 12, June 24, 1864.	Left; circular. A. A. Surg. A. F. A. King. Discharged September 28, 1864.
28	Fox, C. W., Pt, I, 111th New York, age 18.	Mar. 31, May 3, 1865.	Right; circ. Surg. R. B. Bontecou, U. S. V. Sept. 7, re-amp. Disch'd Sept. 6, '65. *Spec.* 2454.
29	Francis, F., Pt., C, 5th New York Heavy Artillery, age 17	July 18, Aug. 20, 1864.	Right; long post. flap. Surg. — Miller, C. S. A. March 30, 1865, re-amp. Discharged August 11, 1865. *Specs.* 4301, 4327.
30	Fulmer, S. D., Pt., F, 105th Penn., age 21.	July 2, Aug. 21, 1863.	Right; circular. A. A. Surg. F. Hinkle. Discharged Aug. 27, 1864. *Spec.* 1667.
31	*Gallaher, J.*, Pt., C, 10th Louisiana, age 37.	July 2, Aug. 24, 1863.	Left. Exchanged October 2, '63. *Spec.* 2050.
32	Gardiner, A., Pt., D, 93d New York, age 19.	May 5, June 21, 1864.	Right. Surg. N. R. Moseley, U. S.V. June 26, gangrene. Sept. 4, necro. bone rem'd. Disch'd May 11, 1865. *Spec.* 2251.
33	*Gibbons, J. S.*, Pt., K, 30th Virginia.	Sept. 16, 1862, June 18, 1864.	——. Surgeon — Jett, C. S. A. Retired February 15, 1865.
34	Good, J. P., Pt., K, 203d Pennsylvania, age 31.	Jan. 15, Feb. 15, 1865.	Left; circular. Mustered out May 24, 1865.
35	*Grantham, J. W.*, Corp'l, A, 7th Florida, age 26.	Nov. 30, 1864, Jan. 24, 1865.	Right; antero-posterior flap. A. A. Surg. R. McNeilly. Provost Marshal May 6, 1865.
36	Grover, L. G., Corp'l, G, 30th Maine, age 21.	April 23, Aug. 13, 1864.	Left; flap. Dr. George Collins, Bethel, Maine. Disch'd January 8, 1865.
37	Haslam, J., Pt., H, 129th Pennsylvania, age 30.	Dec. 13, 1862, Nov. 17, 1867.	Right; flap. Dr. A. H. Halberstadt, Pottsville, Penn. (Discharged May 18, 1863; amp. toes.) 1868, caries; necrosis. June 25, 1868, re-amputation.
38	Hawley, W. S., Corp'l, E, 51st New York, age 30.	May 19, Oct. 15, 1864.	Left; flap. A. A. Surgeon J. H. Thompson. (May 19, amput'n meta.) Disch'd May 21, 1865.
39	Hayden, I., Pt., K, 14th Ohio, age 20.	Sept. 19, 1863, June 13, 1864.	Left; antero-posterior flap. A. A. Surg. J. H. Drury. Erysipelas. Disch'd August 11, 1864.
40	Hefferman, P., Pt., H, 14th Infantry, age 22.	Aug. 29, 1862, Oct. 8, 1863.	Left; antero-posterior flap. A. A. Surg. R. J. Levis. (September 9, 1863, Chopart's amputation.) Disch'd May 17, 1864.
41	Henderson, D. B., Lieut., C, 12th Iowa.	Oct. 4,'62, Jan. 26, 1863.	Left; flap. Resigned February 16, 1863.
42	Hoffrichter, H., Corp'l, G, 46th Ohio, age 23.	Mar. 20, April 20, 1865.	Left; flap. Surg. B. N. Fish, 27th Mass. Discharged August 12, 1865.
43	Holden, W. G., Pt., B, 30th Mass., age 29.	Aug. 19, Oct. 19, 1864.	Left; antero-posterior flap. Discharged June 9, 1865.
44	Hunt, E. W., Pt., I, 57th Massachusetts.	May 13, Sep.2,'64.	Right. Dr. Gage, Worcester. Gang. Sept. 24, re-amputation. Discharged June 30, 1865.
45	Johnson, A. W., Pt., E, 64th New York, age 23.	Dec. 13, 1862, Oct. 9,'63.	Left; flap. (December 20, 1862, Syme's amputat'n. Discharged January 29, 1863.)
46	Johnson, S., Pt., C, 24th Missouri, age 25.	Feb. 1, Mar. 17, 1863.	Left; flap (caries). Discharged May 5, 1863.
47	*Jones, W.*, Pt., G, 5th Texas, age 22.	July 2, Aug. 5, 1863.	Left. Surg. C. H. Mastin, C. S. A. October 18, bone removed. Exchanged March 17, 1864.
48	Keefer, H., Pt., K, 74th Indiana.	Feb. 23, Ap. 7,'63.	Right; flap. Discharged April 26, 1865.
49	[1]Keen, G., Pt., A, 8th Indiana.	May 23, July 9, 1863.	Left; circular. Surg. W. Watson, U. S. V. Erysipelas. Disch'd September 15, 1863.
50	Kelsey, A., Pt., D, 53d Illinois, age 21.	July 12, Sept. 19, 1863.	Right; flap. Surg. J. T. Randolph, U. S. A. Discharged May 25, 1865.
51	Kock, W., Serg't, A, 1st Virginia Artillery, age 28.	May 15, Sept. 25, 1864.	Right; anterior flap. Ass't Surg. G. B. Parker, U. S. V. Disch'd May 19, 1865.
52	Lee, D., Pt., B, 37th Illinois.	Mar. 7, June 22, 1862.	Right; flap. Surg. E. A. Clark, U. S. V. Discharged August 23, 1862.
53	Lillibridge, F. W., Pt., B, 2d N. Y. Mounted Rifles.	June 18, 1864.	Right. (June 18, Chopart's amp. foot.) Disch'd August 10, 1865. Circular amput'n leg afterward.
54	Long, J., Pt., F, 8th Indiana.	May 22, June 23, 1863.	Right; flap. Discharged September 8, 1863.
55	*Martin, T. B.*, Pt., A, 24th Virginia.	July 3, Aug. 14, 1863.	Left; circular. Surg. — Gillett, C. S. A. (Hæmorrhage.) Recovery.
56	May, M., Pt., A, 9th New York, age 22.	Sept. 17, 1862, Ap. —, '63.	Left; lateral flap. (Primary amp. ankle joint. Disch'd Jan. 16, 1863.) 1870, stump sound.
57	*McDermott, M.*, Corp'l, 1st Virginia Cavalry.	Dec. 13, 1862, ——, '64.	Left. *Specimen* 263, A. M. M.
58	Nash, W., Pt., C, 187th Pennsylvania, age 19.	June 18, 1864, May8,'65.	Right; circular. A. A. Surg. H. M. Bellows. Discharged Aug. 3, 1865.
59	Newman, L., Pt., A, 149th New York.	July 20, Sept. 21, 1864.	Right; circular. A. A. Surg. R. McNulty. Discharged 1865. Re-amputation 1867.
60	Nutter, S. A., Pt., I, 1st Maine Cavalry.	June 7, Sept. 13, 1864.	Left; flap. Drs. A. Towle and J. Sawyer, Biddeford, Maine. Discharged July 27, 1865.
61	Oyler, A., Pt., D, 55th Pennsylvania, age 30.	Se.29,'64, Jan. 18, 1865.	Right; flap. Surg. W. Watson, 105th Penn. (Gangrene.) Discharged May 25, 1865.
62	Pendleton, E., Pt., G, 27th Mass., age 21.	Mar. 8, April 18, 1865.	Left; circular. Ass't Surg. E. F. Hendrick, 15th Connecticut. Discharged Nov. 23, 1865.
63	Perkins, H., Pt., G, 44th Colored Troops, age 18.	Dec.1,'64, Feb. —, 1865.	Left. A. A. Surg. J. S. Giltner. Discharged January 16, 1866.
64	Peters, H., Pt., A, 59th New York, age 33.	May 17, Aug. 17, 1864.	Left; antero-post. flap. March 26, 1865, re-amputat'n. Disch'd June 6, 1865. *Spec.* 4335.
65	Pisher, J. H., Pt., C, 38th Wisconsin, age 30.	July 12, Aug. 15, 1864.	Left; flap. Ass't Surg. H. Allen, U. S. A. Discharged April 8, 1865.
66	Powers, J. W., Pt., C, 29th Wisconsin, age 21.	May 16, Sept. 18, 1863.	Left; flap. Discharged December 19, 1864.
67	Price, S. B., Serg't, A, 2d Ohio, age 22.	May 15, June 15, 1864.	Left; circular. Surg. R. L. Stanford, U. S. V. (May 15, Syme's amp. ankle joint; gangrene.) Discharged October 10, 1864.
68	Pyle, G., Pt., D, 15th Infantry, age 19.	July 3, Aug. 30, 1864.	Left; circular. A. A. Surg. C. H. Fisher. Disch'd July 11, 1865. Died March 27, 1870.
69	Quinn, J., Serg't, K, 169th New York, age 21.	May 16, Aug. 19, 1864.	Left; circular. A. A. Surg. J. H. Thompson. Discharged May 3, 1865. *Spec.* 3102.

115	Seawright, W., Pt., I, 116th Penn., age 19.	May 12, June 14, 1864.	Right; double skin flap. Surg. J. A. Lidell, U. S.V. Died July 19, 1864; pyæmia.
116	[1]Shroeder, C., Corp'l, I, 127th Illinois.	May 13, June —, 1863.	Right; antero-post. flaps. Protruding bone removed. Died September 26, 1863.
117	[2]*Street, J. W.*, —, E, 66th Georgia.	Aug. 31, Oct. 20, 1864.	Left; circular. Ass't Surg. P. H. Wright, P. A. C. S. Died October 28, 1864; pyæmia.
118	Sullivan, J., Pt., C, 56th Massachusetts, age 19.	May 6, June 20, 1864.	Right; circular. A. A. Surg. D. J. Evans. Died August 7, 1864.
119	*Taylor, S. J.*, Pt., E, 30th Alabama, age 21.	Dec. 16, 1864, Jan. 20, 1865.	Left; circular. A. A. Surg. W. M. Rodman. (Necrosis.) Died April 8, 1865; chronic diarrhœa.
120	Wiards, W. C., Corp'l, D, 80th Ohio.	Oct. 4, No. 7,'62.	Left. Died November 13, 1862; pyæmia. *Spec.* 1034.
121	Williams, J., Pt., E, 5th New Jersey, age 27.	June 18, July 26, 1864.	Right; circular. A. A. Surg. F. H. Getchell. (Gang.; hæmorr.) Died Aug. 19, 1864. *Spec.* 3661.

Secondary Amputations in the Continuity of the Leg, Third not indicated.—In sixteen of the secondary amputations in the leg the seat of the operation was not specified; eight proved successful and eight were fatal. The right limb was removed in seven, the left in five cases; in four the side was not indicated.

Successful Secondary Amputations in the Leg, Third not indicated.—The eight operations of this group were performed on Confederate soldiers. Meagre histories of the cases are found on the hospital reports:

Case 806.—Lieutenant *A. Ward*, Co. C, 9th Tennessee, was wounded in the right lower extremity at the battle of Chaplin Hills, October 8, 1862. He was taken prisoner and conveyed to the General Hospital at Perryville, whence Surgeon J. G. Hatchitt, U. S. V., reported the following: "On November 25th I amputated the right leg on account of gangrene of the foot resulting from gunshot wound of the ankle. The operation was performed by the circular method. The integuments where the incision was made were infiltrated with greenish serum. The patient was much exhausted from diarrhœa. He recovered." The records of Perryville Hospital show that the patient was transferred to Danville as a convalescent.

Fatal Cases of Secondary Amputations in the Leg, Third not indicated.—Eight operations performed on seven patients belong to this sub-division; five were Union and two

Confederate soldiers. Pyæmia, secondary hæmorrhage, exhaustion, irritative fever, and phthisis were reported as the causes of death:

CASE 807.—Sergeant J. Evans, Co. I, 29th Colored Troops, aged 33 years, was wounded during the engagement near Richmond, October 12, 1864. Surgeon J. J. Craven, U. S. V., reported his admission to the field hospital of the 3d division, Tenth Corps, with "shot wound of left ankle." Assistant Surgeon E. McClellan, U. S. A., reported the following result of the injury: "The patient was admitted to hospital at Fort Monroe three days after being wounded. His injury consisted of a wound of the foot involving the ankle joint. There was free suppuration and copious discharge of unhealthy pus. The leg was amputated by flap method, on November 17th, by Acting Assistant Surgeon H. B. White. At the time of the operation the patient was in a very weak condition. He died of exhaustion November 19, 1864."

TABLE LXXIX.

Summary of Sixteen Secondary Amputations in the Leg for Shot Injury, Point of Ablation not specified.

[Recoveries, 1—8; Deaths, 9—16.]

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.	No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1	[1]*A. B*——, —, age 24.	Nov. 25, 1863, Feb.—,'64.	Left. Dr. R. H. Taylor, of Memphis. (Nov. —, Pirogoff's amp. ankle; gang.; caries.) Recov'y.	8	*Wright, J. L.*, Corp'l, B, 15th Alabama.	Aug. 22, Nov. 21, 1862.	Right. Ass't Surg. E. A. Drewry, C. S. A. Recovery.

5	*McIntire, B. S.*, Pt., K, 10th Tennessee Cav'ry.	Jan. 29, June 29, 1864.	——. Surg. — Reagan, C. S. A. Recovery.	13	Evans, J., Serg't, I, 29th Colored Troops, age 33.	Oct. 12, Nov. 17, 1864.	Left; flap. A. A. Surgeon H. B. White. Died November 19,'64; exhaustion.
6	*Ward, A.*, Lieut., C, 9th Tennessee.	Oct. 8, Nov. 25, 1862.	Right; circular. Surg. J. G. Hatchitt, U. S. V. Gangrene. Recovered February 12, 1863.	14	Hillebrand, M., Pt., D, 1st Ohio.	Sept. 19, —, '63.	Right. Died November 2, 1863; pyæmia.
7	*Ward, P. H.*, Pt., B, 6th Louisiana.	June 27, Oct. 6,'62.	Right. Recovery.	15	Keach, H., Pt., I, 164th New York, age 22.	June 3, J'y 5,'64.	Right; flap. A. Surg. — Gibbs, P. A. C. S. Died Aug. 9, 1864.
				16	Waters, W. W., Pt., D, 22d Indiana.	——— Aug. 29, 1862.	——; erysipelas. Died August 31, 1862; phthisis pulmonalis.

AMPUTATIONS IN THE CONTINUITY OF THE LEG OF UNCERTAIN DATE.

The intervals between the dates of the injuries and operations could not be ascertained in five hundred and seventy cases, either one or the other of the dates and sometimes both having been omitted in the reports. The operations were performed in the upper third in fifty-one, in the middle in forty-seven, and in the lower third in fifty-one instances; in four hundred and twenty-one cases the point of ablation was not recorded.

Amputations in the Upper Third of the Leg of Uncertain Date.—Of fifty-one operations of this group thirty-three proved successful and eighteen were fatal; forty-five were performed on Confederate and six on Union soldiers. The side injured was not specified in fifteen cases; in twenty the right, and in sixteen the left leg was amputated.

TABLE LXXX.

Summary of Fifty-one Amputations in the Upper Third of the Leg, time of Ablation not specified.

Amputations in the Continuity of the Leg of Uncertain Date and without Indication of the Seat of Operation.—In four hundred and twenty-one cases of amputations in the leg neither the interval between the injury and the operation nor the precise seat of the operation was reported. The operations were performed on four hundred and eighteen patients, in three instances both legs having been amputated. Ninety-six were Union and three hundred and twenty-two Confederate soldiers. One hundred and thirty-nine operations resulted successfully, and one hundred and ninety-seven fatally, while the termination of eighty-five cases was not ascertained. The rate of mortality of the cases in which the results were determined was therefore 58.6 per cent. The right limb was removed in one hundred and forty-three, the left in one hundred and fifty-three cases; in one hundred and twenty-five reports the side was not mentioned. As will be seen from the subjoined table, the reports of the cases are very incomplete.

Table LXXXIII.

Summary of Four Hundred and Twenty-one Cases of Amputations in the Leg of Uncertain Date and Seat of Operation.

[Recoveries, 1—139; Deaths, 140—336; Results unknown, 337—421.]

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1	*Abernathy, M. J.*, Lieut., E, 1st Arkansas.	———	——. Transferred June 26, 1865.

In one instance (Case 16, p. 558) the arm, and in a second instance (No. 155, p. 560) the forearm, was amputated at the time of the removal of the leg. This is the last cate-

gory of the five thousand four hundred and fifty-two amputations in the leg for shot injury performed during the American civil war.

RECAPITULATION.—In thirty-nine instances, with nineteen recoveries, nineteen deaths, and one unknown result, both legs were amputated. The five thousand four hundred and fifty-two (5452) operations were therefore performed on five thousand four hundred and thirteen (5413) soldiers, of whom three thousand nine hundred and seventy-four (3974) belonged to the Union and one thousand four hundred and thirty-nine (1439) to the Confederate armies. Of the operations on the Union soldiers the results were recorded in all but fifteen cases. Two thousand five hundred and seventy-nine (2579) recovered, and one thousand three hundred and eighty (1380), or 34.8 per cent., died. Of the Confederate soldiers the results in one hundred and twenty-two cases remain undetermined; nine hundred and sixty-three survived, and three hundred and fifty-four, or 26.8 per cent., perished. This favorable percentage of mortality among the Confederates, however, would probably be materially affected had it been practicable to ascertain the results in the one hundred and twenty-two undetermined cases. In fifteen of the five thousand four hundred and fifty-two cases of amputations in the leg, the opposite limb was amputated in one instance at the hip,[1] in seven in the thigh,[2] in two at the ankle joint, and in five through the foot; re-amputations in the leg for diseased stumps or hæmorrhage were performed in one hundred and forty-four cases. In six instances the amputation in the leg was followed by disarticulation at the knee, and in seventy-one by ablation in the thigh. The right leg was involved in two thousand three hundred and sixty-nine cases, the left in two thousand five hundred and forty-four, and in five hundred and thirty-nine the side was not recorded.

CONCLUDING OBSERVATIONS ON SHOT FRACTURES OF THE BONES OF THE LEG.—As already stated, the shot fractures of the bones of the leg number eight thousand nine hundred and eighty-eight (8,988). They form the most numerous group of shot fractures of the long bones of the extremities, comprising nearly one-third of the twenty-nine thousand and three (29,003) cases of this nature recorded during the American civil war, as follows: Shot fractures of the humerus (*Second Surgical Volume*, TABLE LV, p. 666) eight thousand two hundred and forty-five (8,245), or 28.4 per cent.; shot fractures of the radius and ulna (*Second Surgical Volume*, TABLE CXXIV, p. 922) five thousand one hundred and ninety-four (5,194), or 17.9 per cent.; shot fractures of the femur (TABLE XX, p. 175, *ante*) six thousand five hundred and seventy-six (6,576), or 22.6 per cent.; and shot fractures of the bones of the leg (TABLE LXI, p. 432, *ante*) eight thousand nine hundred and eighty-eight (8,988), or 31.0 per cent. It will be borne in mind that cases involving the articulations in the upper as well as in the lower extremities are not included in these tabular statements.

It has been shown in TABLE LXI, page 432, *ante*, that of eight thousand nine hundred and eighty-eight (8988) cases of shot fractures of the bones of the leg the bone injured was specified in five thousand and seventy-two (5072) instances; one thousand and thirty-three (1033) were fractures of the fibula, two thousand five hundred and eighty-eight (2588)

leg treated without operative interference give a mortality rate of 13.8 per cent. From the above table (TABLE LXXXIV), in which an attempt has been made to collect as far as

[1] SCHMIDT (JOSEPH) (*Speculum Chirurgicum oder Spiegel der Artzney*, Augspurg, 1656, pp. 155, *et seq.*) details seven cases of shot fractures of the bones of the leg treated conservatively; five recovered and two proved fatal: Steffan, shot fracture left leg, February 20, 1641; recovery. H. Bernet, dragoon, shot fracture left leg, May 6, 1648; pieces of bone removed; recovery. Lieut. Rossmann, fracture upper third left leg, May 21, 1648; recovery. Lieut. L. Kytzinger, aged 60, shot fracture upper third right leg, May 18, 1648; fatal. M. Zorn, shot fracture left leg; recovery. H. J. Buchrer, shot fracture tibia with great loss of soft parts; recovery. F. T. Marin, shot wound of right leg; fatal. [2] PURMANN (M. G.) (*Funfftzig Sonder-und Wunderbahre Schusswunden Curen*, Leipzig, 1721) details five successful cases of shot fractures of the bones of the leg: *Obs.* IV, p. 53, D. Griesing, wounded during Siege of Stettin, August, 1677; fracture of both bones of leg; recovery. *Obs.* XIII, p. 113, H. Rother, shot fracture tibia, Anckam, 1676; recovery. *Obs.* XIII, p. 115, C. Wutke, wounded at Stettin, in 1677; shot fracture left tibia; recovery. *Obs.* XXIX, p. 222, J. Fischer, shot fracture left leg and left

practicable the cases of shot fractures of the bones of the leg recorded by military surgeons of other campaigns, it will be seen that the mortality rate of these cases is 18.5 per cent., or 4.7 per cent. in excess of those of the American civil war. Examining the remote effects

arm at Stettin, in 1676; recovery. *Obs.* XXXIIX, p. 282, H. II——, shot fracture left fibula and right tibia, Anecklam, 1678; recovery. [3]CANNAC (*Sur une jambe écrasée par un obus, ou petite bombe,* in *Mém. de l'Acad. Roy. de Chir.*, 1753, T. II, p. 494) cites the case of an officer wounded at the siege of Douay, in 1710; shot fracture middle third of tibia, removal of spiculæ; recovery. [4]SCHMUCKER (J. L.) (*Chirurgische Wahrnehmungen*, Berlin und Stettin, 1774, B. II, pp. 503, *et seq.*) records three cases of recovery after shot fractures of the bones of the leg: Cadet von Sasse, fracture lower third of tibia, Molwitz, April 10, 1741; spiculæ removed; recovery, with curvature of leg—upper part of fibula movable while walking. Captain Graf le Mede, fracture of tibia, Leuthen, December 5, 1757; recovery, with curvature. Major von Ruitz, fracture of both legs, one in middle and the other in the lower third, Schweidnitz, May 16, 1762; splinters removed; recovery. [5]RAVATON (*Chirurgie d'armée ou traité des plaies d'armes à feu*, Paris, 1768) records three cases: *Obs.* XCII, p. 369, Corp'l La Joie, Regiment Condé, fracture of middle third of left tibia and fibula, July 29, 1743; long incisions, removal of splinters; recovery. *Obs.* XCVI, p. 376, Grenadier A. Riant, fracture of middle third tibia, Nov. 20, 1759; recovery. *Obs.* CI, p. 387, F. D'Amour, shot fracture upper third left tibia, Warbourg, August 7, 1760; removal of splinters; recovery, with shortening. [6]BOUCHER (*Sur des playes d'armes à feu compliquées sur-tout de fracas des os*, in *Mém. de l'Acad. Roy. de Chir.*, Paris, 1753, T. II) records, at p. 463, the case of an English voluuteer, wounded at Fontenoy, April 30, 1745; shot fractures of head of humerus and middle third of leg; amputation at shoulder joint; recovery; and at p. 474, the case of a soldier of the regiment de la Couronne, wounded at Tournay, in 1745; fracture of middle third of fibula; fatal. [7]BORDENAVE (*Précis de plusieurs observations sur les playes d'armes à feu en différentes parties*, in *Mém. de l'Acad. Roy. de Chir.*, 1753, T. II, p. 528) cites a case observed by M. TURSAN of shot fracture of upper third of tibia; the patient recovered. [8]BAGIEU (*Examen de plusieurs parties de la Chirurgie*, Paris, 1756, p. 132): Engineer, shot fracture middle third right leg; recovery. [9]MÉHÉE (J.) (*Traité des plaies d'armes à feu*, Paris, an VIII, pp. 133, 143) records three cases of recovery following shot fractures of the bones of the leg treated conservatively: Cavalier of the regiment Saint-Jal, shot fracture of both bones of right leg, middle third, Rosbach, November 5, 1757; recovered. A soldier of the regiment of Cuirassiers of Gessler, shot fracture of bones of leg; recovery. M. de Alvensleben, Ensign of the Guards, received a shot fracture of the bones of the leg at Torgau, in 1760; recovery. [10]BILGUER (J. U.) (*Chirurgische Wahrnehmungen, etc.*, Berlin, 1763, Abth. IV, pp. 460, *et seq.*, *Obs.* 30, 31, 34, 37, 42, 44, 45, 49, 50, 55, 56, 58, 59, 61, 62, 65, 66, 67, 68, 72, 73, 75, 81, 84, 85, 90, 93, 96, 110): 29 cases of recoveries occurring during the Seven Years' War, 1756–63; in 4 of the cases the tibia was fractured, in 17 both tibia and fibula, and in 8 cases the location of the fracture was not indicated. [11]BOURIENNE (*Obs. sur les grands fracas d'os à la suite des plaies d'armes à feu*, in DEHORNE'S *Journal de Méd. Mil.*, Paris, 1782, T. I, p. 214): Soldier, wounded July 10, 1760; shot fracture of tibia and fibula in upper third; recovery in six weeks. [12]LAURENT (*Mémoire clinique sur le tétanos chez les blessés*, Strasbourg, an V [1796], p. 61): Lefranc, Sergeant of Grenadiers, shot comminution of leg, 1791(?), tetanus 13 days after injury; recovery. [13]LARREY (D. J.) (*Mémoires de Chirurgie Militaire et Campagnes*, Paris, 1812, T. II, p. 261): General Baudot, shot fracture of bones of leg, Aboukir, March 8, 1801; gangrene; death. [14]HUTIN (F.) (*Mémoire sur la nécessité d'extraire les corps étrangers et les esquilles, dans le traitement des plaies par armes à feu*, in *Mém. de l'Acad. Nat. de Méd.*, Paris, 1852, T. XVI, p. 446): *Obs.* 14, 15, 21, 24, 25, 28, relates six cases of recovery after shot fractures of the bones of the leg during the years 1793 to 1813. In one case (*Obs.* 15) fragments of bone continued to be discharged for 33 years. In one the tibia, in one the fibula, and in four both bones were fractured. [15]GUTHRIE (G. J.) (*A Treatise on Gunshot Wounds*, London, 1827, 3d ed., p. 398): Soldier, wounded at the battle of Rolica, Portugal, August 17, 1808; both bones shattered in two places: recovery [16]FENECH (E.) (*Observations recueillies à l'armée d'Espagne sur les plaies d'armes à feu aux extrémités*, Paris, 1813, Thèse No. 22, *Obs.* VII, p. 10, and *Obs.* XIX, p. 16): Soldier, 31st Infantry, shot fracture of right tibia, before Almeida, May 5, 1811; simple fracture of fibula; fatal. Roques, Lieutenant, 70th regiment, shot in left leg, August 21, 1808, in Portugal; both bones were fractured in the lower third; fatal. [17]HENNEN (J.) (*Principles of Military Surgery*, London, 1829, 3d ed., pp. 131, 190): French soldier, wounded in 1814; left tibia fractured, fragment extracted; recovery. Lieut.-Col. H——, musket ball partially fractured fibula, Bergen-op-Zoom, March 8, 1814; recovered; limb completely varicosed. [18]ARNAL (*Mémoire sur quelques particularités des plaies par armes à feu*, in *Jour. univ. et hebd. de méd. et de chir.*, Paris, 1831, T. III, p. 35) records 17 cases of shot fractures of the bones of the leg treated conservatively; in 8 cases the fibula, in 2 the tibia, and in 7 both bones were fractured; no results are given. [19]JOBERT (DE LAMBALLE) (*Plaies d'armes à feu*, Paris, 1833, pp. 285, *et seq.*) cites 18 cases, with 1 fatal result; in 5 the fibula was interested, in 6 the tibia, in 5 (1 fatal) both bones, and in 2 cases the bone injured was not specified. [20]MÉNIÈRE (P.) (*L'Hotel-Dieu de Paris en Juillet et Août* 1830, Paris, 1830, p. 312); 17 cases (7 recoveries, 10 fatal). [21]LARREY (H.) (*Relation Chirurgicale des événemens du Juillet* 1830, Paris, 1831, p. 119); 2 cases; recoveries. [22]BAUDENS (L.) (*Clinique des plaies d'armes à feu*, Paris, 1836, pp. 483, *et seq.*); 10 cases; 8 of the tibia (5 recoveries, 3 fatal); 2 of the fibula (recoveries). [23]BAGRÉ (*Obs. de Chir., recueillies a l'hôpital Turc, a Alger;* in *Rec. de Mém. de Méd. de Chir. et de Phar. Mil.*, Paris, 1831, T. XXXI, pp. 156, 157, 159): Fracture of tibia 1 (recovery), of tibia and fibula 1 (recovery). [24]ALCOCK (R.) (*Notes on the Med. Hist. and Stat. of the British Legion of Spain*, London, 1838, p. 53); 47 cases (28 recoveries, 19 fatal). [25]PORTER (J. B.) (*Medical and Surgical Notes of Campaignes in the War with Mexico during the years* 1845–46–47–48, in *Am. Jour. Med. Sci.*, 1852, Vol. XXIII, N. S., p. 32); 1 case of fracture of tibia; recovery. [26]RESTELLI (A.) (*Note et Osservazioni eliniche di chirurgia militare*, in *Annali Universali di Medicina*, 1849, Vol. CXXX, p. 265); 8 cases; fractures of both bones in 2 (1 recovery, 1 fatal), of fibula in 4 (all recovered), of the tibia in 2 (1 recovery, 1 fatal). [27]*Des plaies d'armes à feu; Communications faites a l'Académie Nationale de Médecine*, Paris, 1849, par MM. MALGAIGNE, p. 45, 11 cases (5 recoveries, 6 deaths); [28]GOSSELIN, *ibid.*, p. 46, 3 cases (1 undetermined, 2 fatal); [29]HUGUIER, *ibid.*, p. 131, 9 cases (7 recoveries, 2 fatal); [30]JOBERT (DE LAMBALLE), *ibid.*, p. 154, 16 cases (6 recoveries, 10 fatal); [31]BAUDENS, *ibid.*, p. 232, *et seq.*, 10 cases (9 recoveries, 1 undetermined). [32]STROMEYER (L.) (*Maximen der Kriegsheilkunst*, Hannover, 1855, p. 756), 58 cases: Fractures of both bones in 8 cases (7 recoveries, 1 fatal), of tibia in 27 cases (25 recoveries, 2 fatal), of fibula in 23 cases (20 recoveries, 3 fatal). [33]WILLIAMSON (G.) (*Military Surgery*, London, 1863, p. of the cases treated conservatively, it must be admitted, with Guthrie,[1] that the results ought to have been more successful. The reports of the Pension Examiners regarding the conditions of the preserved limb, even at the present time (1881), are replete with accounts of extensive caries and necrosis with continued discharge, enlargement of the limb, irritable ulcers, overlapping with projection of fractured ends, outward or inward curvature, anchylosis of the knee or ankle or of both, contraction of the toes, outward turning of the foot giving the ankle the appearance of being dislocated, extensive and adherent cicatrices, atrophy and weakness, and inability to sustain the weight of the body.[2] Pseudarthrosis was noted only in seven of the three thousand two hundred and ninety-six survivors of shot fractures of the bones of the leg treated without operative interference.

The difficulties in prescribing rules for the proper mode of treating shot fractures of the bones of the leg seem to have been recognized by writers on military surgery, some advocating immediate operation with many restrictions in favor of conservative treatment; others inclining to conservatism, but citing many exceptions in which they consider imme-

fatal). CZERNY (V.) (*Bericht über die im College Stanislaus in Weissenburg behandelten Verwundeten*, in *Wiener Med. Wochenschrift*, 1870, p. 1357); 3 cases: Fractures of both bones, 1 recovery; of tibia, 1 recovery; 1 result unknown. FISCHER (G.) (*Dorf Floing und Schloss Versailles*, in *Deutsche Zeitschrift für Chirurgie*, Leipzig, 1872, B. I, p. 250); 61 cases: Fractures of both bones in 42 cases (28 recoveries, 14 deaths), of tibia in 10 cases (9 recoveries, 1 death), of fibula in 2 cases (recoveries); in 7 cases with unknown results the bone fractured was not specified. FISCHER (H.) (*Kriegschirurgische Erfahrungen*, Erlangen, 1872, p. 198); 33 cases (28 recoveries, 5 fatal). Méd. de Strasbourg*, 1871, p. 202); 5 cases: Fractures of both bones in 2 (recoveries), of tibia in 3 (1 recovery, 1 fatal, 1 result unknown). HEYFELDER (O.) (*Bericht über meine Wirksamkeit am Rhein und in Frankreich während des deutsch-französischen Krieges*, in *St. Petersburger Medicinische Zeitschrift*, 1871, B. II, N. S., p. 59); 1 fracture of tibia; recovery. JOESSEL (*Ambulances de Haguenau*, in *Gaz. M d. de Strasbourg*, 1871, No. 2, p. 21); 10 cases (9 recoveries, 1 fatal). MACCORMAC (W.) (*Notes and Recollections of an Ambulance Surgeon*, London, 1871, p. 118); 43 cases (29 recoveries, 14 fatal). PANAS (F.) (*Mémoire sur le traitement des blessures de guerre par la méthode antiphlogistique*, in *Gaz. Hebd. de Méd. et de Chir.*, 1872, T. IX, p. 390); 3 cases (1 recovery, 2 fatal). PONCET (F.) (*Contribution à la Relation médicale de la guerre de* 1870–71, in *Montpellier Médical*, 1872, T. XXVIII, p. 41); 3 cases (1 recovery, 2 fatal). VASLIN (L.) *Étude sur les plaies par armes à feu*, Paris, 1872, pp. 136, *et seq.*); 8 cases: Fractures of both bones in 1 (recovery), of tibia in 5 (2 recoveries, 3 fatal), of fibula in 2 (fatal). [51] TILING (G.) (*Bericht über* 124 *im Serbisch-türkischen Kriege im Baracken-Lazareth des Dorpater Sanitäts-Trains zu Swilainatz behandelte Schussverletzungen*, Dorpat, 1877, pp. 63, *et seq.*); 12 cases (9 recoveries, 3 fatal).

[1] GUTHRIE (G. J.) (*Commentaries on the Surgery of the War, etc.*, London, 1855, p. 647): "The treatment of gun-shot fractures of the leg ought to have been more successful than it has been, even when both bones were broken; the want of success may be in part attributed to the remissness which has taken place in supplying the necessary, nay, the essential appliances, by means of which much suffering might have been alleviated, perhaps prevented, even if cures could not have been effected."

[2] BERTHOLD (*Statistik der durch den Feldzug* 1870–71, *invalide gewordenen Mannschaften des* 10 *Armee-Corps*, in *Deutsche Militairärztliche Zeitschrift*, 1872, Jahrg. 1, p. 505) notices the frequency of anchylosis of the knee or ankle joints in fractures of the upper and lower thirds of the tibia, and on page 569 remarks, of the cures of fractures in both bones, that "the results were, in general very unfavorable, and a higher average of disability shows itself than in fractures of the femur."

diate amputation indispensable. Thomson, after the battle of Waterloo in 1815, gives four classes[1] of injuries of the leg in which he considers amputation proper; but adds that "it may be doubted whether the practice of immediate amputation would be proper or necessary in all these cases, could the wounded be conveyed directly into convenient hospitals." Jobert de Lamballe declares conservative treatment and excision alike ineffective in oblique fractures of both bones of the leg in the lower third.[2] Beck, after the European revolutions in 1848,[3] and Schwartz after the Schleswig-Holstein War, 1848–50,[4] advised conservative measures in transverse or slightly oblique fractures of the tibia only, but counselled the removal of the limb in fractures of both bones; but after his experience in the Franco-German War, 1870–71, Generalarzt Beck greatly restricted the number of cases in which he considered amputation justifiable.[5] The conservative views of Guthrie regarding shot fractures of the leg have already been adverted to on page 460, *ante*. Demme[6] asserts that Guthrie has "too far extended the limits of conservative treatment." Stromeyer,[7] Sédillot,[8] Legouest,[9] and Hamilton[10] agree that in extensive comminution of the tibia, or of both bones of the leg, especially near the knee or ankle joints, it is prudent to amputate. Gross[11] declares that in shot fractures of both bones, "unless the patient is peculiarly fortu-

[1] THOMSON (J.) (*Report of Observations in the British Military Hospitals in Belgium, after the Battle of Waterloo*, Edinburgh, 1816, p. 240): "1st, In cases in which both bones of the leg have been broken; 2d, in cases in which the bullets have passed through the ends of the tibia and have fractured this bone near to the knee or ankle joints; 3d, in cases in which a bullet is lodged deep in the tibia; and 4thly, in fractures of the tibia, with wounds of the arteries in the leg."

[2] JOBERT (DE LAMBALLE) (*Plaies d'armes à feu*, Paris, 1833, p. 288): "Toutes les fois qu'une fracture oblique a eu lieu, vers la région inférieure du membre, chez un homme dont les forces musculaires sont, puissantes, malgré l'appareil le plus convenable, malgré la demi-flexion, malgré la résection des deux extrémités de l'os, pratiquée dans le but de ne pas laisser les parties molles irritées par leurs aspérites, toujours, ou presque toujours, la mort est survenue après une série de symptômes formidables, d'inflammation, de suppuration, d'érysipèle et de gangrène, et dans quelques chances que l'on a appelées heureuses, les malades ne se sont sauvés qu 'après avoir été cent fois au bord de la tombe, et en conservant un membre déformé."

[3] BECK (B.) (*Die Schusswunden*, Heidelberg, 1850, p. 263): "Is the tibia fractured, and is there only a transverse or slightly oblique fracture, the injury is to be treated as a simple one; but when there is great splintering, or when the fracture is considerable, or the bone injured in several parts, or when the soft parts are much implicated, amputation must be performed; when both bones are fractured the wound generally is a serious one, the fracture is more comminuted, and the limb must be removed; simple fractures only give promise of complete recovery of the extremity."

[4] SCHWARTZ (H.) (*Beiträge zur Lehre von den Schusswunden*, Schleswig, 1854, p. 184): "Extensive comminuted fractures in the upper or lower thirds of the tibia always require primary amputation. . . Is the fracture in the middle third, as a rule primary amputation is also to be performed; very favorable circumstances only, as good constitution of the patient, easy transportation, excellent hospital accommodations, large and free wounds of the soft parts, defined limits of comminution, etc., can justify the attempt at conservation;" and on p. 186: "Fractures of both bones, with extensive comminution of both bones or of the tibia alone, require primary amputation. . . Isolated cases of this class, it is true, have been treated; yet such attempts will only succeed in a few instances, and will, in the majority of cases, result in death, and even in cases of recovery, imperfectly useful limbs will be obtained."

[5] BECK (B.) (*Chirurgie der Schussverletzungen*, Freiburg i. Br., 1872, p. 718): "Since the location of the bones, particularly the tibia, is a very superficial one, since all changes can easily be recognized and operated for, since phlegmon and abscesses are accessible to observation and to the knife from the first moment, and since no particular obstacles are to be met with in the extraction of splinters and dead pieces of bone.—there is a large and fruitful field opened to the expectant conservative treatment of shot fractures of this limb."

[6] DEMME (H.) (*Militär-Chirurgische Studien*, Würzburg, 1861, Abth. II, p. 275): "GUTHRIE has too far extended the limits of conservative treatment. The experiences of the last wars have only too frequently led to the conviction that by sacrificing the limb at the proper time, life may be saved. Here also holds good the general rule according to which especially the comminutions and the extensive lacerations of the soft parts indicate primary amputation. The laceration of the principal blood vessels of the leg come next."

[7] STROMEYER (L.) (*Maximen der Kriegsheilkunst*, Hannover, 1855, p. 287): "8. Tibia and fibula are fractured by a ball, with extensive splintering. Under favorable circumstances the leg may here be preserved. For example, if only one of the bones was struck by the ball and the other was broken by the weight of the body in falling, or when the fissuring is limited. 9. The tibia alone is splintered to a large extent. Here also the preservation of the leg is possible, but not probable;" and at p. 742: "Shot injuries of the fibula alone, however extensive, never indicate amputation, providing the tibio-tarsal joint is not implicated. . . Extensive comminutions of the tibia alone, and of the tibia and fibula together, do not *per se* necessitate amputation, as they do not destroy the vitality of the limb. Experience, however, teaches that in the attempt to save the limb, very readily the life of the patient is lost, especially through pyæmia, and that in cases in which the limb was preserved it was of less use than a wooden leg."

[8] SÉDILLOT (*Du traitement des fractures des membres par armes de guerre*, in *Archiv Gén. de Méd.*, Paris, 1871, T. XVII, VI^e sér., p. 451): "L'amputation immédiate paraît, indiquée lorsque les deux os sont brises près du genou en fragments volumineaux, avec ou sans complication d'hémorrhagie et de paralysie, circonstances qui ajoutent encore à la nécessité de l'operation. . . Les fractures complètes des deux os de la jambe au tiers moyen et au tiers inférieur guérissent sans doute, mais se consolident difficilement et après beaucoup d'accidents. Il semble donc prudent quand les éclats osseux sont considerables, les pertes de substance étendues, les parties molles violemment déchirées e contuses, de se decider à l'amputation, soit au tiers supérieur soit jusque dans les condyles du tibia, opération moins sûre, pensons-nous, qu'au lieu d'élection, mais infiniment préférable au sacrificé de la cuisse."

[9] LEGOUEST (L.) (*Traité de Chirurgie d'Armée*, Paris, 1872, 2d ed., p. 531): "Les amputations sont très-souvent indiquées dans les blessures de la jambe: elles sont indispensables lorsque les deux os de la jambe sont fracturés dans une grande étendue; lorsque le tibia seul est fracturé avec éclats volumineux ex perte de substance osseuse considérable."

[10] HAMILTON (F. H.) (*A Practical Treatise on Fractures and Dislocations*, Philadelphia, 5th ed., 1875, p. 512): "Gunshot fractures of the shafts of both tibia and fibula demand amputation where the comminution is extensive, or the pulsation of the posterior tibial artery is lost, or the foot is cold and insensible. We do not mean to say that some limbs thus situated have not been saved, but only that the attempt to save such limbs greatly endangers the life of the patient, while amputation at or below the knee is relatively safe."

[11] GROSS (S. D.) (*A System of Surgery*, Philadelphia, 1872, 5th ed., Vol. II, p. 1012): "Gunshot fractures of both bones of the leg are also, generally speaking, bad accidents; great swelling followed by diffuse abscess, usually rapidly sets in and unless the patient is peculiarly fortunate he will

nate he will be very apt to sink under the effects of erysipelas, pyæmia, osteomyelitis, or hectic irritation;" while Heine[1] and Ochwadt[2] contend that by proper conservative treatment happy results may be achieved in many of these cases.

In conservative treatment of cases of shot fracture of one or of both bones of the leg all loose spiculæ were removed, the fractured ends coaptated, and the leg placed in an easy position or secured in a fracture box or in splints. Among the latter, many of the appliances referred to on pp. 343–349, *ante*, as used in fractures of the femur, were also employed in fractures of the leg; but Smith's anterior splint and Hodgen's cradle splint seem to have been largely preferred to all others. Of the fracture boxes, that of Petit[3] (Fig. 326), so highly recommended by the practical Heister,[4] and later by Stromeyer[5] and Esmarch,[6] was extensively used. In the register of the Nineteenth Army Corps Depot Field Hospital at Winchester, under the charge of Surgeon L. P. Wagner, 114th New York Volunteers, is found a drawing of a fracture box used at that hospital, a copy of which is shown in the annexed wood-cut (Fig. 327). The bottom of the box was filled with earth, and the heel was kept somewhat raised by strips of adhesive plaster (*a a*) fastened around the foot and over the foot board, as indicated in the drawing. Extension and counter-extension were rarely applied. Generally shot fractures of the tibia or of both bones healed very slowly. Of the nineteen examples cited on pp. 433 to 444, the wounds did not close in two until fifteen, and in one until twelve, years after the injury. In a fourth case (Case 690, p. 439, *ante*) a large sequestrum was removed eight months after the injury; the wound closed but broke out again, and the discharge of pus continued for eleven years, and when the wound finally closed the patient's health declined rapidly and he died in about six months. It should be added that in two of these four cases (Cases 680 of Colonel W. F. Lynch and 692 of Major A. J. Bolar) the missile or a portion thereof had never been removed from the leg. The remaining fifteen patients recovered—one in one month, three in three months, one in five months, one in six, one in eight, two in ten, three in twelve, one in eighteen, and two in twenty-four months, or at an average, in about ten months.[7]

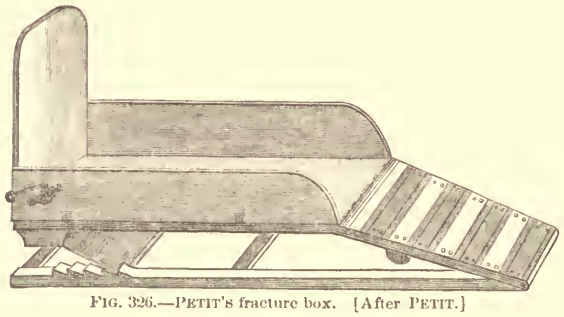

Fig. 326.—Petit's fracture box. [After Petit.]

be very apt to sink under the effects of erysipelas, pyæmia, osteomyelitis, or hectic irritation, not to say anything of the danger of mortification, which is often very great, especially when the bones are comminuted at the same time that severe injury has been sustained by the soft parts. Gunshot fracture of the fibula alone is usually much less serious than similar injury of the tibia."

[7] Surgeon-Major Gaujot, in his report from the hospitals at Montechiaro (J.-C. Chenu, *Stat. Méd.-Chir. de la Camp. d'Italie en* 1859 *et* 1860, Paris, 1869, T. II, p. 778), states that according to his experience comminuted fractures of the leg heal slower than those of the thigh: "Il est à remarquer que, lors de notre départ, les fractures de la jambe étaient beaucoup moins avancées vers la guérison que celles de la cuisse. Dans aucun cas 'il n'y avait encore trace de formation du cal, mais, au contraire, une suppuration abondante, des fusées purulentes provoquées par des esquilles nombreuses, s' éliminant difficilement. Nous n'osons avancer que les désordres occasionnés dans les cas de fracture comminutive de la jambe par coup de feu, sont plus

Of the three thousand nine hundred and thirty-eight (3938) patients with fracture of the bones of the leg treated without operative interference, three thousand four hundred and eighty-four (3484) were Union and four hundred and fifty-four (454) Confederate soldiers. Of the former, two thousand nine hundred and fifty-six (2956) recovered, four hundred and forty-six (446) died, and eighty-two (82) results were not ascertained, a fatality of 13.1 per cent. Of the latter, three hundred and forty (340) recovered, eighty-two (82) died, and in thirty-two (32) cases the results remained undetermined, a mortality rate of 19.4 per cent. One thousand five hundred and fifty-five (1555) injuries, with one thousand three hundred and thirty-five (1335) recoveries, one hundred and eighty-nine (189) deaths, and thirty-one (31) undetermined results, were on the right side; one thousand seven hundred and seventy-two (1772), with one thousand five hundred and twenty-nine (1529) recoveries, two hundred and nineteen (219) deaths, and twenty-four (24) unknown results, on the left side; in six hundred and eleven (611) cases the side was not indicated.

Detached splinters and fragments of bone are reported to have been removed in three hundred and forty-seven instances with two hundred and ninety-nine recoveries, forty-two deaths, and six undetermined results. Of the grave complications, pyæmia was noted in eighty-one cases, seventy-five of which terminated fatally; two cases of recovery from tetanus, and twenty-two fatal cases are reported. Of seventy cases of gangrene, thirty had fatal results. There were sixty-five cases of secondary hæmorrhage; twenty-four of the patients recovered, the hæmorrhage having been controlled in twelve instances by compression and styptics, and in twelve instances by ligation; forty-one of the patients died, twenty-seven after treatment by compression, and fourteen after ligation. The femoral artery was ligated in five cases with three deaths, the posterior tibial in nine with four deaths, the anterior tibial in six with three deaths, the popliteal in five with three deaths, and the anterior and posterior tibials in one instance, which terminated fatally. In nine cases the bleeding vessels were secured in the wound, and in thirteen at a distance from the injury. Four of the former and nine of the latter ended in death.

Excisions in the Continuity of the Bones of the Leg.—An examination of the reported examples of excision in the bones of the leg, whether in the tibia or in the fibula, or in both bones, shows conclusively that in a large proportion of the cases the operation was injudicious. Not only does the percentage of fatality after excision exceed that of the cases treated by conservation, but the remote results in the cases of recovery in the former were even less satisfactory in regard to usefulness of the limb than those in the latter. The fatality of the conservatively treated fractures of the tibia was 10.3, of the fibula 9.7, and of both bones 20.2 per cent., while that of the corresponding excisions was 25.6, 27.2, and 61.1 per cent., respectively. Excisions in both bones were rarely performed, only eighteen cases of this nature being reported, and the large mortality (61.1 per cent.) following this operation would seem to justify its banishment from military surgery.[1] The excisions per-

diffeiles à conjurer que ceux que présentent les fractures de la cuisse, et cependant cette remarque ressort des faits observés par nous. Le tibia est souvent fendu en éclats dans une grande partie de sa longueur; ses esquilles se détachent lentement; son tissu spongieux et le canal médullaire suppurent aisément et la réparation est extrêmement lente." BILLROTH (TH.) (*Chirurgische Briefe aus den Kriegs-Lazarethen in Weissenburg und Mannheim* 1870, Berlin, 1872, p. 272) notes the tedious process of separation of sequestra in shot fractures of the leg. HANNOVER (A.) (*Die Dänischen Invaliden aus dem Kriege* 1864, Berlin, 1870, p. 27) observes that "the separation of necrosed bone frequently was of long duration with persistent fistulæ."

[1] STROMEYER (L.) (*Maximen der Kriegsheilkunst*, Hannover, 1855, p. 743) remarks of the fractures of the bones of the leg that "the hopes built upon excision in the continuity were found delusive, as well in regard to preservation of life as in regard to usefulness of the limbs preserved by exeision." DEMME (H.) (*Militär-Chirurgische Studien*, Würzburg, 1861, B. II, p. 276): "Resection of the diaphysis of both bones of the leg was performed several times in Italy. I have to mention four cases of this kind in the hospitals of Brescia, which all proved fatal from continued suppuration and pyæmia. The subperiosteal method was here also tried by LARGHI, but, for the reasons already stated, had no better results. I believe, therefore, that I must join STROMEYER and the majority of the military surgeons in condemning the operation." PITHA (F. R. VON) (*Krankheiten der Extremitäten*, Erlangen, 1868): "For resection the leg offers an unfavorable field: the operation is, therefore, seldom and with great reserve performed." BECK (B.) (*Chirurgie*

formed in the tibia exceeded those in the fibula, the former being one hundred and eighty-five, the latter one hundred and eighty-two, with the percentage of fatality slightly in favor of the excisions in the tibia. The results of this operation in European war surgery as exhibited in the following table have been still less satisfactory; of one hundred and fifty-two cases, one hundred and six, or 69.7 per cent., had fatal terminations:

TABLE LXXXV.

Results of Shot Fractures of the Bones of the Leg treated by Excision on the Occasions named and from the Authorities quoted.

der Schussverletzungen, Freiburg, i. Br., 1872, p. 721): "To saw through the diaphysis in its entire thickness before the necrosed portion has yet demarcated and separated itself completely, I cannot approve of, because, on the one hand, too much is often taken away unnecessarily, thereby giving occasion to too great a loss of substance, to a colossal defect in the bone, and, in consequence thereof, to pseudarthrosis; and, on the other hand, infectious processes with fatal results are readily caused by again laying open the bony cavity. One may, therefore, quietly wait until sequestrotomy can be performed under more favorable circumstances."

Excision for shot fracture in the continuity of the bones of the leg, in military surgery, does not seem to have been practised before 1848. In that year [1] B. BECK (*Die Schuss-Wunden*, Heidelberg, 1850, p. 338) excised portions of both tibiæ and a portion of the fibula in an Austrian soldier of the Kaiser Franz Josef Regiment, wounded in 1848, near Vienna, by a grape shot. The missile entered the right and passed through the left leg, fracturing both tibiæ just below the knee. Amputation of both thighs was advised but not allowed by the patient. A few days later the fractured ends of both tibiæ were excised, and splints applied; extensive infiltration, fever, and diarrhœa followed, and the patient died on the 7th day after the injury. [2] F. ESMARCH (*Ueber Resectionen nach Schusswunden*, Kiel, 1851, p. 28) and [3] L. STROMEYER (*Maximen der Kriegsheilkunst*, Hannover, 1855, p. 756) tabulate 13 cases of excision in the shafts of the bones of the leg, with 6 recoveries and 7 deaths. Portions of the tibia were excised in 7 (3 recoveries, 4 fatal), of the fibula in 3 (2 recoveries, 1 fatal), and of both bones in 3 (1 recovery, 2 fatal). Detailed accounts of several of these cases are found in ROSS (G.) (*Militairärztliches aus dem ersten Schleswigschen Feldzuge im Sommer* 1848, Altona, 1850, pp. 30, 53, 60, 61, and 62): Prussian volunteer J——, fracture of head of right fibula with grazing of tibia, Bilschau, April 24, 1848; resection of upper end of fibula by ROSS; pyæmia, death. Prussian Captain v. K——, Düppel, June 5, 1848; ball penetrated the upper third of right tibia; excision of a triangular piece of bone by ROSS; death June 19, 1848, of pyæmia. J. H. K——, Oldenburg Infantry, wounded May 28, 1848; comminution of left fibula; excision of 3 inches by KUHN, June 11; recovery. H. G——, 31st Prussian Infantry, Düppel, June 5, 1848; fracture of right fibula; June 6, excision of 6 inches by LANGENBECK; June 25, ligation of the crural artery; recovery; no formation of new bone; limb useless. Captain J. C——, Hochtrup, June 7, 1848; comminution of right tibia; June 8, excision of several inches of tibia by LANGENBECK; June 22, ligation of femoral; June 24, amputation of leg; death June 24, 1848. Lieutenant H——, Schlesswig-Holsteinischen Dragoons, fracture of both bones of leg June 12, 1848; excision of over 3 inches of both bones by LANGENBECK, June 14; death from tetanus June 22, 1848. In another instance a considerable portion of the upper third of the tibia was excised; recovery with flexed knee; leg useless. [4] BERTHERAND (A.) (*Campagnes de Kabylie*, Paris, 1862, p. 109): C——, 11th Infantry; comminuted fracture of right fibula; excision of sharp points of fibula; recovery in less than 6 weeks. [5] MATTHEW (T. P.) (*Med. and Surg. Hist. of the British Army, etc., in the years* 1854–55–56, London, 1858, Vol. II, p. 368) tabulates a successful case of excision of lower end of fibula, but gives no details. [6] CHENU (J. C.) (*Rapport, etc., de la Campagne d'Orient*, Paris, 1865, p. 505): Th. Duval, 86th line; shot fracture of left leg August 16, 1855; resection of tibia; recovery with flexion of leg upon the thigh. [7] DEMME (H.) (*Mil.-Chir. Studien*, Würzburg, 1861, B. II, p. 278) tabulates 7 (2 successful and 5 fatal) cases; in 4 of the fatal cases both bones were excised. [8] CHENU (J.-C.) (*Stat. Med.-Chir. de la Camp. d'Italie en* 1859 *et* 1860, Paris, 1869, T. II, p. 820), 8 cases (1 recovery and 7 fatal). On pp. 819, 820, he gives details of two of the cases: P. Godin, 76th line, aged 24, received at Solferino, June 24, 1859, a shot fracture of the left fibula in its upper third. He was taken to the hospital at St. Mandrier, where, on October 14, Dr. BEISSON excised the upper third of the fibula; osteomyelitis supervened and death ensued October 18. J. Camboulives, 74th line, shot fracture of lower third of left leg, Montebello, May 20, 1859; resection of 5 centimetres of the fibula; anchylosis of the tibio-tarsal articulation, with rigidity of the toes. CHENU further relates (*loc. cit.*, p. 819) that a resection of both bones of the leg was successfully performed at Brescia on a Garibaldian volunteer by A. BERTANI, chief surgeon of Garibaldi's corps. [9] LANGENBECK (B. v.) (*Ueber Resection des Fussgelenks be Schussfracturen desselben*, in *Berliner Klin. Wochenschrift*, 1865, Jahrgang II, p. 31): Corporal Reiss, 60th Infantry, shot fracture of middle third of left tibia and fibula, April 18, 1864; extensive infiltration; subperiosteal excision of 4 inches of tibia and 1 inch of fibula by LANGENBECK. Recovery with 1¾ inches shortening. The deficiency of bone has been supplied by a voluminous new formation of bone exceeding in thickness the normal size of the tibia. [10] LÜCKE (A.) (*Kriegschirurgische Aphorismen aus dem zweiten Schlesswig-holsteinschen Kriege im Jahre* 1864, in *Archiv für Klin Chir.*, Berlin, 1866, B VII, p. 126). Heerde, 25th Infantry, shot comminution of right tibia and fracture of fibula, 1½ inches

The amount of bone excised varied from one-half inch to twelve inches,[1] and in one instance the entire fibula, with the exception of about one inch of the external malleolus, was removed (CASE 720, page 457, *ante*). Forty-nine, or 12.6 per cent., of the three hundred and eighty-seven excisions in the bones of the leg were subsequently followed by ablation of the limb, viz: twenty-one by amputation in the leg, five by exarticulation at the knee joint, and twenty-three by amputation in the thigh. Considering the usefulness of the limb, especially after excision in the tibia or in both bones of the leg, the results must be regarded as unsatisfactory. In the case of Private J. Hogan, 127th Pennsylvania

above ankle joint, in April, 1864. A fenestrated gypsum bandage was applied. Excision of 2 inches of the tibia a month after the injury by Dr. LÜCKE; recovery. In November, 1864, the patient walked well, extensive new formation of bone, exceeding in thickness the normal tibia. [11] HEINE (C.) (*Die Schussverletzungen der unteren Extremitäten*, Berlin, 1866, p. 311): A Prussian officer, Lieut. R——, shot wound of right leg, April 18, 1864, fracturing tibia and fibula in the middle third, and extensively lacerating the soft parts; free incisions and application of gypsum bandage. June 8, excision of 1 inch of tibia by Dr. LANGENBECK; recovery, with ¼ inch shortening; according to the latest account no union of bone had taken place. [12] BECK (B.) (*Kriegschirurgische Erfahrungen während des Feldzuges* 1866, Freiburg, i. Br., p. 343) twice successfully excised portions of the tibia, retaining as much as possible of the periosteum. Both patients recovered in a short time, and the deficiency in the bone was supplied by nature in a few weeks. [13] FISCHER (K.) (*Militairärztliche Skizzen aus Süddeutschland und Böhmen*, Aarau, 1867, p. 98) states that he saw an excision of the diaphysis of the tibia performed by TEXTOR for shot fracture just above the ankle joint, four days after the injury. The lower extremity of the tibia was saved; the patient did well. [14] BIEFEL (R.) (*Im Reserve-Lazareth. Kriegschirurgische Aphorismen von* 1866, in *Archiv für Klin. Chir.*, Berlin, 1869, B. XI, p. 468): Joh. Drost, shot comminution of tibia and fibula of right leg, June 27, 1866, by canister shot; enormous infiltration; excision of about 4 inches of both bones August 7, 1866; periosteum preserved; death August 27, 1866. [15] OTIS (G. A.) (*Circular* No. 3, War Department, S. G. O., Washington, 1871, pp. 227, 228): Pt. W. Hostler, D, 38th Infantry, shot comminution of left fibula, Fort Bayard, New Mexico, July 10, 1868; excision of about 3½ inches of fibula and ligation of peroneal artery above and below wound on same day by Acting Assistant Surgeon J. Le Carpentier; death July 12, 1868. Pt. J. Shaw, D, 3d Cavalry, shot wound of right tibia, received in fight with Indians October 17, 1867; necrosis; excision of necrosed portion by Assistant Surgeon W. M. AUSTIN, U. S. A., February 2, 1868; recovered and returned to duty. [16] BECK (B.) (*Chirurgie der Schussverletzungen*, Freiburg i. Br., 1872, p. 900): G——, artilleryman, fracture of left leg in lower third from canister shot; immediately after the injury excision of portions of the injured bone was performed; subsequent amputation of the leg; recovery. IDEM (*loc. cit.*, pp. 907, 909, 910) also reports, from hospitals at Rastatt and Strassburg, 5 instances of excisions in the bones of the leg; 3 were excisions in the fibula and proved successful; 2 excisions in the tibia were fatal. FISCHER (G.) (*Dorf Floing und Schloss Versailles*, in *Deutsche Zeitschrift für Chirurgie*, Leipzig, 1872, B. I, p. 253): Unknown, shot fracture of both bones in middle third; 21 days after injury 1 inch was excised from the upper and 2 from the lower ends; also removal of splinter 3 inches long; patient doing well at the end of six weeks. In another case in which the tibia was extensively splintered a fragment of the bone was extracted on the 12th and 1½ inches were excised on the 21st day after the injury; death 15 days after the operation. RUPPRECHT (L.) (*Militärärztliche Erfahrungen während des deutsch-französischen Krieges im Jahre* 1870–71, Würzburg, 1871, p. 86) cites a successful secondary excision in the fibula performed at the Bavarian hospital No. VIII. at Antony and Massy. SOCIN (A.) (*Kriegschirurgische Erfahrungen gesammelt in Carlsruhe* 1870 *und* 1871, Leipzig, 1872, p. 141) details 2 cases: H. Scherf, shot fracture of tibia and fibula of right leg in middle third, Toul, August 16, 1870; removal of splinters; resection of protruding portion of tibia September 15, 1870; recovery, with 8 centimeters shortening; large callus but no union of bone. Ferdinand Schwand, shot fracture of both bones of right leg, Wörth, August 6, 1870; excision of 3 centimetres of tibia August 17; recovery, with very little shortening and consolidation of bone. [17] CHENU (J.-C.) (*Aperçu Hist. Stat. et Clin., etc., pendant la Guerre de* 1870–1871, Paris, 1874, B. I, p. 493) tabulates 97 cases of excisions in the continuity of the bones of the leg, in the French army, of which 76, with 13 recoveries and 63 deaths, were in the tibia, and 21, with 4 recoveries and 17 deaths, in the fibula. In the alphabetical enumeration of pensioners after amputations, disarticulations, and resections, in the second volume of Dr. CHENU'S work, the following cases of excision in the bones of the leg are mentioned: J.-B. Bourguignon (p. 21), 11th Chasseurs, shot fracture of left fibula, Villorceaux, Dec. 9, 1870; excision of fibula; gangrene; recovery with anchylosis of ankle joint. J.-B. Millot, 23d line (p. 106), comminuted fracture of left leg at Tertre, January 11, 1871; resection; recovery with considerable shortening. P.-A. Originaire (p. 114), 12th Cuirassiers, shot comminution of leg at Gravelotte; resection of portion of tibia; incomplete consolidation. C.-V. Ridel (p. 128), 82d line, comminuted shot fracture of left tibia, Villorceaux, Dec. 8, 1870; resection; atrophy of limb. This case is detailed by CHIPAULT, (A.) (*Fractures par armes à feu*, Paris, 1872, p. 157), who states that the operation was performed on May 22, 1871, and that 18 centimetres of the tibia were excised. There is regeneration of bone and no apparent shortening of the limb. E.-I. Schneider (p. 136), shell wound of right leg, received at Villiers-sur-Marne; resection of considerable portion of tibia. A.-J.-B. Soviche (p. 139), 11th line, comminuted shot fractures of left forearm and right leg, Sedan; excision in lower third of tibia; atrophy of leg. L.-M.-A. Vedel (p. 147), 76th line, shell fracture of right leg, Strassbourg, September 17, 1870; excision of 4 centimetres of both bones; recovery. Besides the cases mentioned by CHENU, the editor has been able to gather from the sources indicated particulars of the following instances of excision in the continuity of the bones of the leg practised on French soldiers during the Franco-German War, 1870–1871, not detailed by CHENU: F. Delalande (CHIPAULT) (A.) (*Fractures par armes à feu*, Paris, 1872, p. 173), wounded at Orleans. December 4, 1870, in the lower part of the left leg; no consolidation on December 31, 1870; resection of 9 centimetres of the fibula; recovery without shortening. The space between the sawn ends of the bone is filled with a firm substance. Joseph G—— (A. COUSIN, *Histoire Chirurgicale de l'ambulance de l'école des ponts et chaussees*, in *L'Union Médicale*, 1872, T. XIII, p. 158), shell fracture of left leg, November 29, 1870; erysipelas; gangrene; excision of about 6 centimetres of tibia; death December 22, 1870. F. Albertini (O. HEYFELDER, *Bericht über meine Wirksamkeit am Rhein und in Frankreich während des Deutsch-französischen Krieges*, in *St. Petersburger Med. Zeitschrift*, 1871, B. II, N. F., p. 59). 3d Voltigeurs, shot fracture of bones of leg, Landonchamp, October 7, 1870; excision of the fractured portion of the tibia November 18; recovery without deformity and with new formation of bone. E. Terrier (O. HEYFELDER, *loc. cit.*, p. 59). 62d line, shot fracture of tibia received at Gravelotte; secondary excision of 4 centimetres of the tibia; recovery. M. Maze (T. BILLROTH, *Chirurgische Briefe aus den Kriegs-Lazarethen in Weissenburg und Mannheim* 1870. Berlin, 1872, p. 234, No. 47, and H. LOSSEN, *Kriegschirurgische Erfahrungen aus den Barackenlazarethen, etc.*, in *Deutsche Zeitschrift für Chirurgie*, 1873, B. II, p. 140), ——, 48th Infantry, shot fracture of both bones of right leg August 4, 1870; ends of tibia excised on the field; loss of 1½ to 2 inches of bone; in March, 1871, the wounds had healed but the parts had not consolidated. [18] TILING (G.) (*Bericht über* 124 *im Serbisch-türkischen Kriege im Baracken-Lazareth des Dorpater Sanitats-Trains zu Swilainatz behandelte Schussverletzungen*, Dorpat, 1877, p. 72): Simeon Raschitsch, aged 40, shot fracture of left tibia, August, 1876; excision of 12 centimetres of tibia, September 7, 1876; amputation in lower third of thigh September 15; death September 16, 1876. [19] KADE (E.) (*Das temporüre Kriegslazareth des Ressorts der Anstalten der Kaiserin Maria im Kloster Mariahimmelfahrt bei Sistowa*, in *St. Petersburger Medicinische Wochenschrift*, 1877, B. II, p. 385) states that a successful excision in the diaphysis of the fibula was performed in the hospital near Sistowa under his charge.

[1] In the 185 excisions in the tibia, 1½ inches were removed in 5, 2 inches in 23, 2½ inches in 8, 3 inches in 26, 3½ inches in 7, 4 inches in 14, 4½ inches in 5, 5 inches in 7, 5½ inches in 2, 6 inches in 7, and 7, 8, and 8½ inches in 1 instance each, and in 78 the length of bone removed was not indicated. Of the 182 fractures of the fibula, ½-inch was removed in 3 instances, 1 inch in 2, 1½ inches in 6, 2 inches in 22, 2½ inches in 10, 3 inches in 33, 3½ inches in 7, 4 inches in 20, 5 inches in 7, 6 inches in 3, 6½ inches in 3, 7 inches in 1, 8 inches in 2, 12 inches in 1, and in 1 instance nearly the entire fibula; in 61 fractures of the fibula the amount excised was not stated. In the 18 instances of excisions in both bones of the leg the amount removed varied, according to the nature of the injury in each bone, from 2 to 5 inches in the tibia and from 2 to 8 inches in the fibula; in 3 instances neither the bone implicated nor the amount excised was indicated

Volunteers (CASE 703, page 445, *ante*), Assistant Surgeon W. Thomson, U. S. A., states that "the leg was perfectly helpless, a hiatus of nine or ten inches existing in the tibia, with no hope of any improvement from the lapse of time," and remarks: "no more useless or unphilosophical operation could be devised than the one done in this case." Colonel W. F. Fitch, 29th Ohio Volunteers (CASE 705, page 446, *ante*), who visited the Army Medical Museum in 1870, six years after the operation, greatly regretted that amputation had not been performed. Three inches of the tibia had been excised and the bone remained ununited; the calf of the leg was atrophied, and the foot swollen and useless. In the case of Lieutenant O. R. Fyler (CASE 704, page 446, *ante*), 2d Connecticut Heavy Artillery, Examining Surgeon H. E. Gates reported, in 1877, that "the whole leg and thigh is atrophied. The fibula is bowed outward, and there is partial dislocation of its head. The leg bends easily at the seat of the injury and no weight can be borne upon it. I have no doubt the fibula would instantly give way if the applicant should stand upon it. There is great tenderness at the head of the fibula from stretching of the ligaments, the line of support from the bending of the leg being thrown outward toward this articulation. The pensioner wears an appliance weighing seven pounds, which incases the limb and gives the only support. The disability is progressive on account of displacement and bending of fibula, etc. I consider his present condition worse than if he had amputation above the knee; locomotion is very painful indeed." Pseudarthrosis, rarely noted in the cases treated without operative interference, was recorded in at least twenty-eight of the cases of recovery after excision in the bones of the leg.[1] In the case of Private J. Lagro, 10th Vermont Volunteers (CASE 719, page 457, *ante*), Examiner O. F. Fassett reports that "the bones have never united except by ligament, so that a false joint now exists;" and the same examiner, in 1877, thirteen years after the injury, states: "The wound is still an open, suppurating, and discharging sore, the bone being extensively diseased. The disease is so near the joint that amputation must be above the knee. His condition now is worse than with loss of the leg above the knee. The leg is bent into a curve and greatly deformed." In the cases in which the excision was performed in the continuity of the fibula useful limbs were preserved in several instances, but as a rule the foot could not be planted even, as it would turn outward from the want of fibular support.

Amputations in the Leg.—At the time of the publication of the preliminary report of 1865,[2] the results of two thousand three hundred and forty-eight (2348) amputations in the leg, giving a mortality rate of 26.02 per cent., had been ascertained. Further examination of the returns has augmented the number to five thousand four hundred and fifty-two (5452) and has increased the rate of mortality from 26.02 per cent. to 32.9 per cent.; yet the final results, as reported in the preceding pages, compare favorably with the results of amputations in the leg obtained in other wars, as exhibited in TABLE LXXXVI on the opposite page. Of the seven thousand six hundred and thirty-seven cases cited in this table, the final results were ascertained in seven thousand and thirty-eight. One thousand eight hundred and thirty-nine (1839) were successful and five thousand one hundred and ninety-nine (5199) fatal, giving a death rate of 73.8 per cent. This excessive rate of

[1] HEINE (C.) (*Die Schussverletzungen der unteren Extremitäten*, Berlin, 1866, p. 319), who considers the fracture in the bones of the leg the most favorable field for excision, "as here the reproductive powers of the bony substance, as well as of the periosteum, seem to be especially active and fruitful," admits, on page 331, that "when the strength of the patient has not suffered too much, it is unquestionably preferable to await the separative process to be performed by nature, as a resection, in every instance, adds a new wound to the old one with new dangers, and finally a condition not too rarely resulting, but which we have as yet not mentioned, must not be overlooked, viz: the supervening of pseudarthrosis."

[2] *Circular* No. 6, War Department, Surgeon General's Office, Washington, November 1, 1865, p. 47.

mortality is principally due to the deplorable fatality attending the operations among the French troops in the Crimean, Italian, and Franco-Prussian Wars.

TABLE LXXXVI.

Summary of Seven Thousand Six Hundred and Thirty-seven Amputations in the Leg for Shot Injuries on the Occasions named and from the Authorities quoted.

OCCASIONS AND AUTHORITIES.	CASES.	RECOVERIES.	DEATHS.	UNDETERMINED.

As a rule the surgeons of the American civil war amputated in every part of the leg regardless of the point of election, sacrificing as little as possible of the sound portions of

An early, and probably the earliest recorded example of amputation in the leg following shot wound is that reported by PARÉ (A.) (*Œuvres de*, Paris, 1599, p. 408, Chap. XXII): Captain François Le Clerc had his foot carried away just above the ankle by a cannon ball. The wound healed, but the leg became troublesome, and the patient had the limb amputated the width of five fingers below the knee. He recovered with a serviceable stump.—Four examples of amputation in the leg are recorded by [2] SCHMIDT (JOSEPH) (*Speculum Chirurgicum oder Spiegel der Artzney*, Augspurg, 1656, pp. 153, 156, 157): 2 were successful, 1 fatal, and 1 result unknown: B. Lundlaw, of the regiment Wallenstein, received, November 22, 1663, a shot fracture of both bones of the left leg; amputation of leg; death November 16, 1663. H. Braunmüller, Oheim's regiment, shot in the left leg May 23, 1663; amputation of leg; result not recorded. Cavalryman G. Burger, Caselcki's regiment; left leg carried away above the ankle; amputation higher up; recovery. A corporal of von Oelter's Bavarian regiment; left foot torn away; amputation in leg; recovery.—[3] BOUCHER (*Obs. sur des Playes d'armes à feu compliquées sur tout de fracas des os*, in *Mém. de l'Acad. de Roy. de Chir.*, Paris, 1753, T. II, p. 470) cites five amputations in the leg for wounds received at Fontenoy, April 30, 1745: A captain of Hainaut's regiment had the leg amputated in the field; recovered October 26, 1745. In the case of a lieutenant of the regiment Clare, the limb was successfully amputated 6 days after the injury. Of the remaining three, one died from hæmorrhage 11 hours after amputation, and the other two survived the operation 16 and 20 days respectively. DE GARENGEOT (*Moyens de rendre plus simple et plus sûre l'amputation à lambeau*, in *Mém. de l'Acad. Roy. de Chir.*, 1753, T. II, p. 262): A soldier of the King's regiment received a shell wound of the right foot with fracture of both bones of the leg; amputation 8 days after the injury; healed in 27 days. FAURE (*L'amputation étant absolument nécessaire dans les plaies compliquées de fracas des os, etc.*, in *Prix de l'Acad. Roy. de Chir.*, Paris, 1819, T. III, pp. 339, 340) details 3 cases of secondary amputations in the leg, the operation being performed, one on the 46th and two on the 47th days after the injury; all recovered. BAGIEU (*Examen de plusieurs parties de la Chirurgie*, Paris, 1756, p. 97): Shot fracture of tibia and fibula; primary amputation of leg; fatal. RAVATON (*Chirurgie d'armée ou traité des plaies d'armes à feu*, Paris, 1768, p. 372): Shot wound of left leg; amputation 6 weeks after injury; fatal. IDEM (*loc. cit.*, p. 404): Fray, of Schomberg's regiment, shot fracture of left foot in September, 1755; primary amputation; recovery.—[4] SCHMUCKER (J. L.) (*Vermischte Chirurgische Schriften*, Berlin und Stettin, 1785, B. I): Captain von Wedel, shot fracture of ankle joint, August 11, 1760; amputation of leg at upper third; fatal.—[5] LARREY (D. J.) (*Mém. de Chir. Mil. et Camp.*, Paris, 1812, pp. 265, 269): Lieut. Bonichon, 21st Light Infantry, shot wound of left foot, October 7, 1798; tetanus; amputation in upper third; recovery. Another amputation for tetanus following shot wound was performed by LARREY on March 21, 1801; tetanus subsided, but the patient died 13 days after the operation. IDEM (*loc. cit.*, T. II, p. 195): Captain M——, wounded at the second battle of Aboukir, in 1801; amputation immediately below the knee; recovery. IDEM (*loc. cit.*, T. III, pp. 56, 83, 156, 389, 391, and 378) refers to 16 cases of amputation in the leg: Han-

the bones of the limb. One thousand five hundred and nine (1509) of the five thousand four hundred and fifty-two (5452) amputations were performed in the upper third, one thousand four hundred and eighty-one (1481) in the middle, one thousand four hundred and seven (1407) in the lower third, and in one thousand and fifty-five (1055) instances the seat

---

nequin, fracture of leg in upper third, Eylau, February 8, 1807; amputation through tuberosity of tibia; recovery. During the same campaign LARREY performed 3 similar operations through the tuberosity of the tibia; the patients recovered. At Ulm, in October, 1805, an officer received a shot through the ankle; gangrene and fever; amputation below the point of election; recovery. In Egypt, in 1799, LARREY twice successfully amputated close to the knee joint, and nearly on a level with the head of the fibula, and at Wagram and Esslingen, in 1809, 9 similar operations were performed by him; but the results are not indicated. Of 3 cases of amputation of both legs performed after Wagram, 1 performed immediately after the reception of the injury proved successful; 2 others were fatal. IDEM (*loc. cit.*, T. IV, pp. 56, 69, 156, and 164) details 4 cases of amputation in the leg during the Russian campaign 1812–13: 3 were successful and 1 proved fatal. LARREY (D. J.) (*Clinique Chirurgicale*, Paris, 1829, T. III, pp. 651, 652, 662, 664, and 665) cites the cases of Dosmenil, wounded at Wagram, in 1809; amputation in middle third; recovery. Lambels, wounded in the Russian campaign, 1812, amputation in upper third; recovery. General Laferrière, wounded at Craonne in 1814; amputation in middle third; recovery. An officer, wounded at Moscow in 1812; amputation in upper third; recovery. General Chémineau, wounded at Lutzen in 1813; amputation in upper third; recovery. Robsomen, wounded at Hanau in 1813; amputation in upper third; recovery. IDEM (*loc. cit.*, T. IV, pp. 279, 282): Gault, an officer of dragoons; shot fracture of upper third of right leg; amputation below the knee; recovery. Colonel d'Esclignac, amputation of leg; recovery. CHAVANE (X.) (*Considérations theo.-prat. sur l'amputation à faire à la suite des fractures comminutives de la jambe, etc.*, Paris, 1814, Thèse No. 99, pp. 7, 9, 10) details 3 successful amputations in the leg. KLEIN (D. C.) (*Practische Ansichten der bedeutendsten chirurgischen Operationen*, Stuttgart, 1815, p. 31) relates a successful case of amputation at the ankle and subsequent ablation in the leg. HENNEN (J.) (*Principles of Military Surgery*, 3d ed., London, 1829, pp. 275, 277): Chatelot, wounded in 1815, amputation leg; death. M——, 3d guards, amputation of leg July 11, 1815; death August 3, 1815. GUTHRIE (G. J.) (*Commentaries, etc.*, 6th ed., London, 1855, p. 158) tabulates 93 cases with 23 deaths, after the battle of Waterloo, in 1815; 43, with 7 deaths, were primary, and 50, with 16 deaths, were secondary operations. GUTHRIE (G. J.) (*A Treatise on Gunshot Wounds, etc.*, 3d ed., London, 1827, p. 308) reports 28 amputations in the leg performed near New Orleans, from January 8 to April 24, 1815; 26, with 3 deaths and 23 recoveries, were primary operations, and 2, both fatal, were secondary operations.—[6] TROWBRIDGE (A.) (*Gunshot Wounds*, in *Boston Med. and Surg. Jour.*, 1838, Vol. XVIII, p. 342) cites 1 case of amputation of leg and 1 of both legs from the siege of Fort Erie, in 1814; both patients recovered.—[7] LARREY (H.) (*Rel. Chir. des Evénemens de Juillet* 1830, Paris, 1831, p. 122): 6 amputations in the leg (3 successful, 3 fatal). MÉNIÈRE (P.) (*L'Hotel-Dieu de Paris en Juillet et Aout* 1830, p. 325): 3 amputations in the leg; fatal. ARNAL (*Mém. sur quelques particularités des plaies par armes à feu*, in *Jour. Univ. et Hebd. de Méd. et de Chir. Prat.*, Paris, 1831, T. III, p. 35): 1 amputation of leg; recovery. ROUX (*Plaies d'armes à feu. Communications, etc.*, Paris, 1849, pp. 37, 38): 6 amputations of leg (4 recoveries, 2 fatal). JOBERT (DE LAMBALLE) (*Plaies d'armes à feu*, Paris, 1833, pp. 303–305) cites 3 amputations in the leg (no results).—[8] LARREY (H.) (*Hist. Chir. du Siége de la citadel le d'Anvers*, Paris, 1833, p. 334): 22 cases; 20 primary (16 recoveries, 4 deaths), 2 secondary (1 recovery, 1 fatal.—[9] BAUDENS (L.) (*Clinique des plaies d'armes à feu*, Paris, 1836, p. 540): 1 amputation of left leg; recovery. BAGRÉ (*Obs. de Chir., recueillies a l'hôpital Turc, a Alger*, in *Rec. de Mém. de Méd. de Chir. et de Phar. Mil.*, Paris, 1831, T. XXXI, p. 168): 1 amputation; recovery.—[10] SÉDILLOT (C.) (*Camp. de Constantine de* 1837, Paris, 1838, p. 266): 5 amputations in the leg (2 recoveries, 3 fatal).—[11] ALCOCK (R.) (*Notes on the Med. Hist. and Stat. of the British Legion in Spain*, London, 1838, p. 95): 12 amputations in the leg (11 recovered, 1 fatal); 3 with 2 recoveries primary, and 9 recoveries were secondary operations.—[12] PORTER (J. B.) (*Med. and Surg. Notes of Campaigns in the War with Mexico, during the years* 1845–1848, in *Am. Jour. Med. Sci.*, 1852, Vol. XXIII, N. S., pp. 31, 32): 3 amputations in the leg (1 recovery, 2 fatal).—[13] *Des plaies d'armes à feu Communications, etc.*, Paris, 1849, par MM. ROUX (p. 11), 2 amputations (1 recovery, 1 fatal); MALGAIGNE (p. 46), 2 amputations (recoveries); HUGUIER (p. 143), 2 amputations (recoveries); JOBERT (p. 154), 1 amputation (recovery); BAUDENS (p. 233), 1 amputation (recovery).—[14] RESTELLI (A.) (*Note ed Osservazioni cliniche di chirurgia militare*, in *Annali Universali di Medicina*, 1849, Vol. CXXX, pp. 243, 244): 4 cases (2 recoveries, 2 fatal). [15] DJÖRUP (*Bemaerkninger over de i Krigen* 1848–50 *forelagne Amputationer i Forbindelse med en Statistik over dem*, in *Hospitals-Meddelelser*, Kjöbenhavn, 1852, B. V, p. 106): 48 cases (29 recoveries, 19 fatal). STROMEYER (L.) (*Maximen der Kriegsheilkunst*, Hannover, 1855, pp. 756, 757): 46 cases (28 recoveries, 18 fatal).—[16] BECK (B.) (*Die Schusswunden*, Heidelberg, 1850, Tabella): 3 cases (2 recoveries, 1 fatal).—[17] HEYFELDER (J. F.) (*Die Verwundungen und Operationen in Folge des Bombardements von Sveaborg vom* 9.–11. *Aug.*, in *Deutsche Klinik*, 1855, B. VII, pp. 495 and 575): 10 cases (2 recoveries, 8 fatal).—[18] CHENU (J.-C.) (*Rapport, etc., pendant la Campagne d'Orient en* 1854–'55–'56, Paris, 1865, p. 666): 1,306 cases (368 recoveries, 938 fatal). HÜBBENET (C. v.) (*Die Sanitäts-Verhältnisse der Russischen Verwundeten wahrend des Krimkrieges in den Jahren* 1854–1856, Berlin, 1871, p. 182): 1,286 cases (69 recoveries, 642 deaths, 575 undetermined). MATTHEW (T. P.) (*Med. and Surg. Hist. of the British Army, etc., in the years* 1854–'55–'56, London, 1858, Vol. II, pp. 368, 369): 106 cases (69 recoveries, 37 fatal).—[19] WILLIAMSON (G.) (*Military Surgery*, London, 1863, p. XXVII): 21 cases (recoveries).—[20] CHENU (J.-C.) (*Stat. Med.-Chir. de Camp. d'Italie en* 1859 *et* 1860, Paris, 1869, T. II, p. 809): 347 cases (116 recoveries, 231 fatal). DEMME (H.) (*Militär-Chirurgische Studien*, Würzburg, 1861, B. II, p. 278): 113 cases (69 recoveries, 44 fatal). GHERINI (A.) (*Rel. chir. dell'Ospedale mil. provisorio di S. Filippo*, in *Annali Univ. di Med.*, Milano, 1860, Vol. CLXXIII, pp. 419, 420): 6 cases (3 recoveries, 3 fatal).—[21] MOUAT (*The New Zealand War of* 1863–64–65, in *Stat. San. and Med. GOLTDAMMER (*Bericht über die Thatigkeit des Reserve-Lazaretts des Berliner Hilfsvereins in der Garde-Ulanen-Kaserne zu Moabit*, in *Berliner Klin. Wochenschrift*, 1871, Jahrg. VIII, p. 152): 2 cases (1 recovery, 1 fatal). GRAF (E.) (*Die Königlichen Reserve-Lazarethe zu Dusseldorf während des Krieges* 1870–71, Elberfeld, 1872, pp. 31, 49): 9 cases (4 recoveries, 5 fatal). KIRCHNER (C.) (*Aerztlicher Bericht über das Königlich Preussische Feld-Lazareth im Palast zu Versailles*, Erlangen, 1872, pp. 88, 89): 9 cases (6 recoveries, 3 fatal). KOCH (W.) (*Notizen über Schussverletzungen*, in *Archiv für Klin. Chir.*, Berlin, 1872, B. XIII, p. 574): 12 cases (9 recoveries, 3 fatal). LOSSEN (H.) (*Kriegschirurgische Erfahrungen aus den Barackenlazarethen zu Mannheim, etc.*, in *Deutsche Zeitschrift für Chir.*, 1873, B. II, pp. 138–148): 4 cases (4 fatal). MAYER (L.) (*Kriegschirurgische Mittheilungen aus den Jahren* 1870–71, in *Deutsche Zeitschrift für Chirurgie*, 1873, B. III, pp. 50, 52): 2 recoveries. RUPPRECHT (L.) (*Militärärztliche Erfahrungen während des Deutsch-Französischen Krieges im Jahre* 1870–71, Würzburg, 1871, p. 15): 5 cases (2 recoveries, 3 fatal). SCHINZINGER (A.) (*Das Reserve-Lazareth Schwetzingen im Kriege* 1870 *und* 1871, Freiburg, i. Br., 1873, pp. 84, 88): 5 cases (4 recoveries, 1 fatal). SEEGER (W. v.) (*Die Leistungen der Vereinsspitäler Kleinkinderschule und Diakonenhaus in Ludwigsburg im Jahr* 1870–71, in *Zeitschrift für Wundärzte und Geburtshelfer*, Stuttgart, 1871, B. XXIV, p. 117): 1 case, fatal. SOCIN (A.) (*Kriegschirurgische Erfahrungen gesammelt in Carlsruhe* 1870 *und* 1871, Leipzig, 1872, pp. 144, 187): 4 cases, fatal. STEINBERG (*Die Kriegslazarethe und Baracken*

of operation was not indicated. The fatality of the operations in the upper third was 27.0, in the middle third 20.6, and in the lower third 27.6 per cent.[1] Here as well as in the amputations of the thigh (*see* TABLE XXIX, p. 213, *ante*) and in the ablations of the fore-arm and arm (*see* TABLE CXXXII, p. 967), and of amputations in the arm (Recapitulation, pp. 805, 806 of the *Second Surgical Volume*), the operations in the middle third of the limb were less fatal than those in the upper or lower thirds. It will also be noted that the mortality of the amputations in the lower third slightly exceeded that in the upper third,[2] a result which appears to argue against the operations in the lower third immediately above the malleoli, advocated and practised by Ravaton[3] and White,[4] and later by Lenoir, Goyrand, and others.[5] Furthermore, of the two hundred and twenty cases of re-amputations in the leg, knee joint, or thigh, the amputations had originally been performed in the lower third of the leg in one hundred and two, in the middle third in seventy-five, in the upper third in forty, while in three the seat of the first operation was not indicated; showing that ablations in the lower third contributed nearly one-half of all the cases of re-amputation. The considerations of greater safety of life, as evinced in the results of amputations of the middle third, and the excellent prothetic apparatus furnished at Government expense to the maimed soldiers, outweigh the objections raised by surgeons to the inconvenience of a projecting limb, necessitated by the use of a peg leg, as well as the question of the greater cost of such apparatus.

From the returns it would appear that of the modes of operation the flap method was most frequently employed—one thousand six hundred and ninety-eight (1698) instances of this procedure being reported, against one thousand two hundred and six (1206) by the circular, twenty-two (22) by the circular flap, and a few by Teale's[6] and Hey's[7] methods; but in at least two thousand five hundred (2500) cases the mode of operation was not indicated. Assistant Surgeon J. T. Calhoun, U. S. A., in his narrative of service at the 4th

division, Second Corps hospital, April 1, 1864, prefers the "long posterior flap with a small crescentic anterior flap, and after sawing the bones always removes the sharp projecting angle of the spine of the tibia." Surgeon Burt G. Wilder, 55th Massachusetts Volunteers, in his observations of cases at Judiciary Square Hospital, prefers the circular method in amputations in the lower third. "Here at least, the circular method is superior to the flap, that is, results in the best stump, both in appearance and for an artificial limb; * * it is evidently the best method where the patient is obliged to undergo any subsequent transportation. The large inferior flap formed from the calf constitutes a very thick cushion at the end of the stump, but the superior edge of the tibia is always thinly covered."

Protrusion of the tibia or fibula or both, frequently noted, especially in cases in which the crest of the tibia had not been removed at the time of the operation, was followed by secondary hæmorrhage, sloughing, and exfoliation. Surgeon B. G. Wilder, 55th Massachusetts Volunteers, remarks of twenty-seven cases of amputations in the leg, observed at the Judiciary Square Hospital at Washington in 1863: "The crest of the tibia was removed at the time of the operation in four cases, and in none of these did the bone afterwards protrude. In three cases sloughing followed a previous secondary hæmorrhage. In eleven cases the tibia or fibula or both protruded through the flap and exfoliation usually followed. Secondary hæmorrhage and sloughing occurred in two, indicating rather a constitutional than a local cause. Omitting these two, there remains nine cases—five of them in the middle third of the leg—in which the crest of the tibia exfoliated to a greater or less extent for no other evident cause than its non-removal at the time of operation. The exfoliations took place at various periods—during the second, third, fourth, sixth, tenth, thirteenth weeks, and in one instance during the fifth month."

To prevent as much as possible the protrusion of the bones, which the great weight of the soft parts forming the calf tended to aggravate, Dr. Frank P. Foster, of the New York Hospital, applied with good advantage an apparatus shown in the appended wood-cut (Fig. 329). A piece of adhesive plaster was cut in the shape shown in Fig. 328; the two limbs were cut through at C C, the surfaces of the end pieces B B reversed, and the pieces joined together again at C C with pins. The adhesive surface of the middle portion A was then applied to the posterior surface of the stump and the ends secured to the outside of an ordinary fracture box, as shown in Fig. 329. Traction downward on the fracture box was effected by means of a weight and pulley.

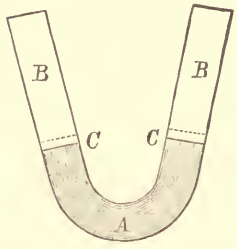

Fig. 328.—Adhesive plaster with reversed ends.

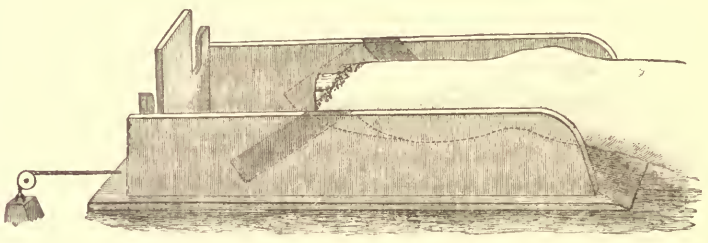

Fig. 329.—Fracture box with stump supported by adhesive plaster.

SECTION VI.

WOUNDS AND OPERATIONS AT THE ANKLE JOINT.

The cases to be considered in this Section are restricted to injuries, by weapons of war, of the bones forming the tibio-tarsal articulation, viz: the lower extremities of the tibia, the fibula, or the astragalus. Injuries of the os calcis and other adjoining bones, unless the ends of the tibia and fibula and the astragalus are likewise involved, are reserved for the next section. Seventeen hundred and twenty-two injuries of the bones forming this articulation were found on the field and hospital returns. All were caused by shot; eleven were contusions, and seventeen hundred and eleven fractures.

SHOT CONTUSIONS OF THE ANKLE JOINT.—Of eleven shot contusions of the bones of the ankle joint indicated on the records, seven were treated throughout without operative interference; four were followed by amputation in the leg. The latter cases have already been cited in the tables of amputations in the leg,[1] and it remains only to give brief details of the cases treated by conservation.

Shot Contusions of the Bones of the Ankle Joint treated by Conservation.—The injuries in the seven cases of this group were confined to the malleoli, in three instances the internal and in four the external malleoli being involved. All resulted in recovery.

CASE 808.—Private *J. G. Clayton*, Co. I, 24th Regiment (Confederate). aged 22 years, was wounded in the left ankle, at Drury's Bluff, May 16, 1864. The missile, a ball, impinged upon the lower end of the tibia, glanced downward and passed through the anterior aspect of the ankle joint, lodging under the skin over the neck of the astragalus, whence it was extracted two days afterwards. One week after the injury the foot and ankle were inflamed and swollen and there was excruciating pain upon the slightest motion, while the grating of the inflamed articular surfaces was distinct. After free incisions to favor the escape of confined pus, which was freely mingled with synovial fluid, and the persistent employment of cold irrigation and anodynes, the local inflammation subsided. In the course of several weeks it entirely ceased and the general condition of the patient became much improved. By the following January the wound had closed and the patient was able to walk with the aid of a cane, though motion of the joint was still imperfect. The history of the case was published[2] by Dr. J. M. Holloway, late Surgeon P. A. C. S.

CASE 809.—Private W. Johnson, Co. B, 147th New York, aged 18 years, was wounded at Hatcher's Run, October 27, 1864, by a minié ball, which grazed the inner malleolus of the left ankle. He entered Lincoln Hospital, Washington, whence he reported to Elmira for muster out May 27, 1865. Not a pensioner.

CASE 810.—Corporal A. Daily, Co. A, 42d Illinois, aged 29 years, was wounded in the right ankle, at Murfreesboro', December 31, 1862, by a musket ball, which took effect upon the external malleolus, touching the bone. He was treated at various hospitals, being assigned to the Veteran Reserve Corps November 25, 1863, and ultimately mustered out and pensioned September 8, 1864. Various examining surgeons certify to weakness of the ankle joint, painfulness, and tendency to inversion of the foot in walking. He was a pensioner in June, 1880.

CASE 811.—Private P. McCabe, Co. G, 87th Pennsylvania, aged 23 years, was wounded in the left ankle, before Petersburg, June 23, 1864, by a musket ball, which contused the external malleolus. He was admitted to Stanton Hospital, Washing-

[1] Cases of Pt. P. Reynolds, K, 5th New Jersey, intermediary amputation, lower third of leg; fatal. *Spec.* 4578, A. M. M. (TABLE LXXIV, No. 300, page 535, *ante*). Pt. W. Sharp, I, 8th New York Heavy Artillery, intermediary amputation, middle third of leg; fatal. *Spec.* 3204, A. M. M. (TABLE LXXIII, No. 349, page 527, *ante*). Pt. J. F. Willetts, B, 1st New Jersey, intermediary amputation, middle third of leg; recovery. (TABLE LXXIII, No. 250, page 526, *ante*). Pt. C. Bennett, D, 9th New Hampshire, secondary amputation, middle third of leg: fatal. *Spec.* 3637 (TABLE LXXVII, No. 138, page 550, *ante*).

ton, eleven days after the injury, with the limb greatly swollen and intensely painful. An abscess was opened on July 10th, and three weeks later a thin narrow piece of bone, about one inch long, exfoliated from the external malleolus. Subsequently another small necrosed piece was removed, after which rapid and steady improvement began and the pain disappeared. About September 25th the patient began to walk on crutches.[1] He was mustered out of service October 13, 1864, and pensioned. The Pension Examining Board in September, 1877, report a "tender and adherent cicatrix, complete anchylosis of the ankle joint, and some atrophy of the leg. In walking he cannot bring the heel to the ground, but puts his weight on the front part of the foot." He was paid his pension in June, 1881.

CASE 812.—Private J. Staton, Co. G, 45th Kentucky, aged 17 years, was accidentally wounded, October 24, 1863, by a pistol ball grazing the external malleolus of the right ankle. He was conveyed to the general hospital at Ashland, where simple dressings were applied. The patient was returned to duty December 3, 1863, and mustered out with his command February 4, 1865. Subsequently he made an unsuccessful application for pension.

CASE 813.—Private T. Ingersoll, Co. E, 8th Kansas, aged 20 years, was wounded by a ball striking the internal malleolus of the left ankle, at Chickamauga, September 19, 1863. He passed through several hospitals, and was mustered out of service September 19, 1864, and pensioned. Examining surgeons certify to weakness and slight enlargement of the ankle joint. His pension was paid to June, 1879.

CASE 814.—Sergeant C. Shade, Co. F, 46th Pennsylvania, age 23 years, was wounded, at Peach Tree Creek, July 20, 1864, by a minié ball striking the external malleolus of the left ankle. Simple dressings constituted the treatment. The patient was returned to duty August 13, 1864, and was subsequently promoted to Lieutenant. He ultimately resigned July 1, 1865, and afterwards became a pensioner. Examining surgeons certify that he complains of pain, weakness, and swelling on over-exertion. His pension was paid to December, 1880.

SHOT FRACTURES OF THE BONES OF THE ANKLE JOINT.—Of one thousand seven hundred and eleven instances of shot fractures involving one or more of the bones of the ankle joint, five hundred and eighteen were treated without operative interference; twenty-nine were followed by excision; four by excision at the ankle and subsequent amputation in the leg; fifteen by amputation at the ankle joint; one by amputation at the ankle joint and subsequent amputation in the leg; and one thousand one hundred and forty-four by amputation in the leg, knee joint, or thigh:

It is to be regretted that in nine hundred and forty-one of the one thousand seven hundred and eleven cases the bones injured were not specified. The internal malleolus was interested in two hundred and seven, the external in one hundred and thirty-one, the

[1] LIDELL (J. A.), *On Contusion and Contused Wounds of Bone, with an Account of Thirteen Cases*, in *Am. Jour. Med. Sci's*, 1865, N. S., Vol. L, p. 36.

astragalus in one hundred and seventy-one, the articular ends of the tibia and fibula in one hundred and two, the tibia and astragalus in sixty-two, the fibula and astragalus in twenty-four, and all three bones composing the joint in seventy-three instances.

SHOT FRACTURES OF THE BONES OF THE ANKLE JOINT TREATED BY CONSERVATION.—The fact that of the one thousand seven hundred and eleven cases of shot fractures of the ankle joint five hundred and eighteen only, or less than one third, were treated by expectant conservative measures, would indicate that the surgeons of the American civil war generally adhered to the teachings of the masters of the early part of the present century, Larrey,[1] Thomson,[2] and Guthrie,[3] who considered shot wounds of the ankle joint extremely dangerous and generally requiring amputation. It must be assumed, therefore, that the most propitious cases only were reserved for conservative treatment. Of the five hundred and eighteen cases the results were ascertained in all but twelve; four hundred and seven had successful and ninety-nine fatal terminations, giving a mortality rate of 19.5 per cent.

CASE 815.—Private J. Dullahan, Co. D, 3d Vermont, aged 24 years, was wounded in the right ankle, at the Wilderness, May 5, 1864. Six days after receiving the injury he was admitted to Harewood Hospital, Washington, and one week later the man was transferred to South Street Hospital, Philadelphia. Surgeon S. J. W. Mintzer, U. S. V., in charge of the latter hospital, recorded a wound of the ankle with compound fracture of the inner malleolus by a minié ball, which entered at the inner malleolus and came out just behind the external malleolus. Cold-water dressings were used. On May 23d there was great pain and swelling, and an application of lead water and laudanum was kept wrapped around the limb; morphia, milk punch, and beef essence being administered. Two days afterwards the wounds of exit and entrance were enlarged, after which the foot was again wrapped up in the same application. On May 27th, the pain still continuing, equal parts of tincture of aconite and water were applied, and two days later a plaster of extract of hemlock was made to cover the entire foot. On May 30th quinine pills were prescribed, and another lotion consisting of laudanum and tincture of aconite was ordered to be constantly applied. The entries in the hospital records at this date mention that the patient was evidently sinking. He subsequently mended, however, and became well enough to be transferred to Brattleboro' on June 29th. Several months later he was transferred to Burlington, where he was assigned to the Veteran Reserve Corps February 21, 1865. The patient was ultimately discharged from service at Sloan Hospital, Montpelier, July 25, 1865, and pensioned. Surgeon H. Janes, U. S. V., in charge of the latter, contributed the photograph represented in the adjacent cut (FIG. 330), and reported that, according to the patient's statement, the lower end of the tibia became necrosed and was gouged out twice at Brattleboro' Hospital. At the time of the man's discharge his general health was good and the wound was nearly healed, with ligamentous anchylosis of the joint and very slight contraction of the muscles of the calf of the leg. There was no appearance of caries or necrosis, and he could walk a short distance with a cane, gaining some motion of the joint by exercise. Examiner A. L. Lowell, of Burlington, Vermont, certified, March 26, 1870: "The cicatrix of entrance is adherent to the bone and healthy, but sensitive to pressure. The inner malleolus is considerably thickened by bony deposit and the new growth is operative in limiting the motions of the foot. The tibio-tarsal articulation is obstructed in its function by false anchylosis. In flexion and extension of the foot the toes describe an arc of but two inches. The foot is inverted to such a degree as to throw the weight of the body on the outer margin of the sole." The pensioner was paid June 4, 1880.

FIG. 330.—Appearance of limb one year after shot fracture of right inner malleolus. [From a photograph.]

CASE 816.—Private P. Driscoll, Co. B, 13th Infantry, aged 26 years, was wounded before Vicksburg, May 19, 1863. Surgeon E. O. F. Roler, 55th Illinois, noted his admission to the field hospital of the 2d division, Fifteenth Corps, with "shot wound of right foot." One week after the reception of the injury the wounded man was conveyed to Memphis, where he entered Jefferson Hospital, and six months later was transferred to Marine Hospital, St. Louis. Surgeon A. Hammer, U. S. V., in charge of the latter, described the injury as a "shot fracture of the ankle joint," and reported that the joint being much enlarged and quite painful he lanced the part on June 18, 1864, when several ounces of pus escaped and several spiculæ of bone were extracted. The patient was in good health at the time of the operation. Warm poultices were frequently applied and afterwards tincture of iodine. On August 6, 1864, the patient was discharged from service and pensioned. Examining Surgeon A.

[1] LARREY (D. J.) (*Mém. de Chir. Mil. et Camp.*, Paris, 1812, T. II, p. 468): "Lorsqu'un éclat d'obus, un biscayen ou une balle ont fracassé les extrémités articulaires, surtout celles qui forment l'articulation du pied ou du genou, et que les ligamens qui affermissent cette articulation ont été arrachés ou rompus, l'amputation immédiate devient indispensable. La même indication se présenterait, si le corps étranger s'était perdu dans l'épaisseur d'une des extrémités articulaires, ou se trouvait enclavé dans l'articulation, de manière à ne pouvoir en être extrait par les procédés simples et ordinaires."

[2] THOMSON (J.) (*Report of Obs., etc., after the Battle of Waterloo*, Edinburgh, 1816, p. 238): "Wounds in which musket balls have passed through, or are lodged in the ankle joint, almost all require immediate amputation. These injuries, by giving rise to high degrees of inflammation and symptomatic fever, not unfrequently prove fatal. Among a great number who had survived the fever, we saw but few in whom secondary amputation was not required; and, in the cases requiring it, this operation was far from being so successful as the primary amputation had been."

[3] GUTHRIE (G. J.) (*A Treatise on Gunshot Wounds, etc.*, London, 1827, 3d ed., p. 398): "Wounds of the ankle joint from gun-shot are extremely dangerous, and in general require amputation."

W. Woodhull, of Newark, N. J., certified April 9, 1868: "A conoidal ball fractured the lower extremities of the tibia and fibula, also several of the tarsal bones. The joint is anchylosed and the heel is kept five inches from the ground. The os calcis and astragalus were seriously fractured. Several pieces of bone have been lost and there is extensive deformity of the parts," etc. The Dayton, Ohio, Examining Board in subsequent reports states that the pensioner "walks on the ball of the toes" and requires the use of a cane. The pensioner was paid June 4, 1881.

In the following instance the missile was firmly wedged into the articulation, and was finally removed by the aid of two trephines used simultaneously, one on each side of the ball:

CASE 817.—Chaplain J. W. W. Bolton, 5th West Virginia Cavalry, aged 26 years, was wounded at Cloyd's Mountain, May 9, 1864, by a minié ball, which entered the right ankle near the external malleolus and lodged. He remained under treatment at a field hospital for six weeks and was then transferred to the general hospital at Parkersburg, whence he was reported as having been "returned to duty November 25, 1864." Some weeks afterwards the patient re-entered the hospital, when his case was reported by Assistant Surgeon W. A. Banks, U. S. V., as follows: "From the time of the injury the patient has been subject to formation of abscesses on either side of the ankle joint. The location of the ball was accurately ascertained with a porcelain pointed probe after all other means had failed. On February 3, 1865, chloroform was administered and the missile was extracted. An incision made below the external malleolus, one and a half inches long, exposed the ball lodging in the articulation, its base being one and a half inches from the surface. The missile was so firmly impacted that it could not be removed by any form of bullet forceps, the metal giving away before the teeth of the forceps. It was finally dislodged by means of two trephine elevators, using one on each side of the ball at the same time. The patient was in good general health at the time of the operation. He did well afterwards. Simple dressings were applied. The wound healed and the patient recovered with an immovable joint." He left the hospital three weeks after the operation, his term of service having expired June 14, 1864. Dr. E. D. Safford, pension examiner, and formerly Acting Assistant Surgeon at the Pakersburg Hospital, in June, 1872, contributed the following supplementary description of the injury: "The ball entered through the external malleolus, into and nearly through the astragalus, where it remained embedded until extracted," etc. "The injury produced extensive inflammation, and as a consequence he has nearly complete anchylosis of the joint and one and a half inches shortening." In his original application the pensioner alleged that seventeen pieces of bone were taken out of the wound at different times. Owing to his disability being considered permanent the pensioner has been exempted from further examinations. His pension was paid September 4, 1881.

CASE 818.—Private F. Lape, Co. K, 34th Massachusetts, aged 20 years, was wounded in the right foot, at New Market, May 15, 1864. He was captured by the enemy and conveyed to hospital at Harrisonburg, where he was seen and examined by Surgeon T. B. Reed, U. S. V., who described the injury as a "wound of the ankle joint;" also, that an opening was made and the ball was searched for and that poultices were applied. After remaining a prisoner for six months the man was exchanged and conveyed to Camp Parole Hospital at Annapolis, whence he was permitted to leave for his home, on furlough, October 31st. Drs. O. E. Brewster and W. W. Greene, of Pittsfield, Mass., who attended the patient at his home, certified that they removed a detached portion of the astragalus from the wounded foot on February 7, 1865. The patient subsequently returned to Camp Parole, and was discharged from service for disability March 21, 1865, Surgeon W. D. Stewart, U. S. V., certifying to "gunshot wound by a ball, which entered immediately behind the internal malleolus, passed forward and outward and lodged, fracturing the end of the tibia and implicating the joint." Examining Surgeon H. Eastman, of Pittsfield, Mass., reported November 5, 1873: "From the appearance of the wound of exit I should say that a number of pieces of bone have been removed. The ankle is perfectly anchylosed; the muscles of the calf of the leg are very much atrophied; the limb is more than one-third smaller than the other and is much lower in temperature. The muscles in the calf are so much contracted that when he is standing the heel is one inch above the floor, obliging him to walk on the anterior portion of the foot." The pensioner was paid September 4, 1881.

CASE 819.—Private S. Vansicklen, Co. D, 9th New York State Militia, aged 20 years, was wounded at Fredericksburg, December 13, 1862. Surgeon C. J. Nordquist, 83d New York, reported his admission to the field hospital of the 2d division, First Corps, with "shot wound of left ankle." Acting Assistant Surgeon L. Dorsey contributed the following description of the injury: "A rifle ball penetrated the ankle, outer surface, fracturing the astragalus and tibia. The man was admitted to Harewood Hospital, Washington, ten days after being wounded. On December 27th he was etherized, when the broken bones were removed from the tibia and astragalus. During the progress of the case it became necessary to make several counter openings. Simple dressings were applied and stimulants and tonics were freely given for a considerable length of time. In May, 1863, the wound had entirely healed and the patient was gradually recovering the use of the ankle joint. On June 4, 1863, he was discharged from service, having regained considerable motion of the joint." He subsequently became a pensioner and entered the National Military Home in Ohio, where he was examined at successive intervals by the Dayton Pension Board, who certified to the ball having passed through the ankle, and described the foot and ankle as being in very good condition, but the joint as partially anchylosed and about one-half inch shortened. The pensioner was paid December 4, 1880.

CASE 820.—Private J. H. Noble, Co. A, 20th Massachusetts, aged 32 years, was wounded and captured at the battle of White Oak Swamp, June 30, 1862. He remained a prisoner for three weeks, and was then exchanged and conveyed to Baltimore, where he entered Camden Street Hospital. Acting Assistant Surgeon E. G. Waters reported: "The injury was caused by a musket ball, which entered the flexure of the left ankle joint in the median line of the leg, passed downward and backward and emerged posteriorly, to the left and one inch above the insertion of the tendo-achillis, completely disorganizing the joint. The patient was admitted in a very prostrated condition. An anterior splint and water dressings were applied, it being deemed advisable to attempt to save the foot. On August 21st the necrosed extremity of the tibia and upper surface of the astragalus were removed with a gouge. At this time a finger could be pressed through the joint and no cartilage could be felt in the line of its passage. On October 20th the splint was removed from the leg and poultices were applied to promote exfoliation. On November 1st a part of the calcaneum and astragalus were removed, and a sinus extending downward from the internal malleo-

lus was laid open. The patient subsequently experienced an attack of erysipelas. There was much thickening, but it rapidly yielded to camphor and mercurial ointment. By January 22, 1863, all discharge had ceased and the case promised to leave an anchylosed joint but a serviceable foot. Though not more than three or four such cases have been under treatment, it is deemed proper to state that this is the only attempt that has been made in this hospital to save a foot after gunshot comminution of the joint, and it is gratifying to know that it has resulted successfully." The removed portions of the bone, comprising twenty small necrosed fragments, were contributed to the Museum by Surgeon A. B. Hasson, U. S. A., in charge of the hospital, and constitute specimen 424 of the Surgical Section. The patient was discharged from service March 23, 1863, and pensioned. Examining Surgeon O. S. Root, of Pittsfield, Mass., certified November 27, 1863: "The applicant is walking on crutches, his limb being shortened one and a half inches and the ankle stiff. He cannot get the heel to the ground. The wound has recently broken open and many pieces of bone have come out," etc. The Hartford Examining Board described the injury December 1, 1875, and reported: "The great toe drops and the second and third toes override it. He has no power over the great toe; has a very perceptible limp in walking, and is obliged to use a cane. The ankle is completely anchylosed, the leg much atrophied and two inches smaller than the other. The leg swells and is painful after using it." In September, 1878, the same board reported that the parts "broke out again and discharged last July, confining him to his bed several weeks. The pensioner complains of more or less constant pain in the leg, and if he uses it much it swells and becomes painful so that he is unable to sleep. He still has to use a cane. The leg is worse than useless." The pensioner was paid September 4, 1880.

CASE 821.—Private E. P. Dutton, Co. H, 2d U. S. Sharpshooters (subsequently transferred to the 4th Vermont), aged 18 years, was wounded in the left ankle, before Petersburg, October 13, 1864. He passed through various hospitals, lastly entering Sloan Hospital, Montpelier, on April 30, 1865. Surgeon H. Janes, U. S. V., in charge of the latter, contributed the photograph represented in the annexed cut (FIG. 331), with the following report: "Gunshot wound of ankle joint by a minié ball, which entered two inches posterior to the internal malleolus, wounding the tendo-achillis, passed forward and outward, and lodged (as the field surgeon stated) in the ankle joint. The missile was removed the next day. No fragments of bone came away then or subsequently. For about three months the discharge was profuse, offensive, and at times dark colored, after which it gradually diminished. The original wound healed in about four and a half months. Abscesses formed between the ankle and the tendo-achillis on each side, which continued to discharge after the wound had healed. About January 1, 1865, the parts became gangrenous, which was checked by the use of nitric acid and bromine in the course of a week, the ulcers healing about two months afterwards. When discharged from service, June 14, 1865, the patient was in good health and able to fully extend the foot, but unable to flex it beyond a right angle. He could walk a mile or two without difficulty, but on going too far he felt pain in the joint. There was also some tenderness at the tibio-tarsal articulation." Examiner L. J. Alleman, of Boone, Iowa, certified to the injury and reported: "Contraction of tendo-achillis and flexor muscles of first and second toes, drawing them inward and upward and deforming the first and second joint of the first toe; indolent ulcer below the external malleolus, and another above the inner malleolus starting from the edge of the wound. Inability to walk on injured foot in consequence of said condition, and disability equal to loss of foot." The pensioner was paid June 4, 1880.

FIG. 331.—Appearance of left leg six months after shot wound of ankle joint. [From a photograph.]

CASE 822.—Private G. F. Durkee, Co. B, 9th Vermont, aged 28 years, was wounded in the left ankle during the engagement at Newport Barracks, February 2, 1864, and entered Mansfield Hospital, Moorehead City, four days afterwards. Surgeon J. B. Bellangee, U. S. V., in charge, reported the injury and added that the internal malleolus was fractured; also that he removed the comminuted bone two days after the patient's admission. The patient subsequently passed through various hospitals, and on December 14, 1864, he was assigned to the Veteran Reserve Corps. Surgeon H. Janes, U. S. V., in charge of Sloan Hospital, Montpelier, contributed a photograph of the case (*Card Photographs*, Vol. III, p. 44), with the following history: "The wound was caused by a minié ball, which entered at a point just external and above the internal malleolus, passed directly downward and emerged at the inside of the sole of the foot, fracturing the tibia and opening the ankle joint. The patient stated that a number of pieces of bone were removed at first, and that several necrosed pieces came away afterwards. At the time of the injury he was in excellent health, and his appetite continued pretty good all the time. At first suppuration was profuse; large abscesses formed in the leg and he became much prostrated. Free incisions were made and cold-water dressings were applied. About April 1st the wound began to improve. It gradually but steadily grew better, and finally closed about the middle of July. He was not able to do without crutches until the latter part of September. After being transferred to the Veteran Reserve Corps he never had to be excused from duty on account of ill health or lameness. On September 14, 1865, when discharged from service, he could flex the foot on the leg to a right angle and extend it about ten degrees more. He was able to walk four or five miles a day, but the joint would swell after going any considerable distance. There was also some tenderness on pressure about the joint." Various examining surgeons have certified to the injury and have stated that "the ankle joint is restricted in its motion;" also that there is a depression on the inner side of the foot, and that the leg is atrophied and shows several scars from abscesses. The pensioner was paid September 4, 1880.

CASE 823.—*W. H. H. Shaw*, a Confederate soldier (regiment not recorded), received a shot fracture of the ankle joint, at Chancellorsville, May 3, 1863. He was admitted to the Richmond Confederate general hospital No. 24, from Camp Winder, August 1st. Two weeks later the wound was in a very bad state of gangrene, and nitric acid was used, also disinfectants, turpentine, and coal tar, which were applied to the leg every day. Tonics and stimulants were administered. During the night of August 18th hæmorrhage took place, the patient losing one pint of blood. On the following day the anterior tibial artery was ligated. By September 8th the patient was improving very fast and the wound was healing. On September 15, 1863, when the patient was furloughed, the wound was nearly healed but he had no use of the foot.

CASE 824.—Private *A. B. McDaniel*, Co. I, 7th North Carolina, aged 34 years, was wounded and taken prisoner at Gettysburg, July 3, 1863. He was admitted to Chester Hospital two weeks after the reception of the injury, where the nature of the wound was not recorded. Three months afterwards the patient was transferred to Point Lookout Hospital, whence Acting Assistant Surgeon R. N. Wright made the following report: "The patient was admitted to this hospital with gunshot wound of left ankle joint. The wound was inflicted by a minié ball, which shattered the joint to a considerable extent, entering just above the external malleolus, passing obliquely downward and forward and fracturing the bones. A number of bony fragments have escaped from the openings and there has been considerable purulent discharge. Erysipelas made its appearance before the patient entered this hospital. At the present time, March 2, 1864, the wounds are healed and the patient is doing well but has very little motion in the joint." The man was forwarded to City Point for exchange the following day, March 3, 1864. The man being a Confederate soldier, no further history of the case could be obtained.

In the next two cases the joint became firmly anchylosed, causing, in each case, the heel to be raised several inches and compelling the patient to walk on the toes:

CASE 825.—Sergeant T. B. Sturdivant, Co. B, 21st New York Cavalry, aged 39 years, was wounded in a cavalry skirmish near Halltown, March 24, 1864. Acting Assistant Surgeon J. H. Bartholf reported: "Gunshot fracture of left ankle joint by a rifled pistol ball, which entered the inner side of the leg five inches above the ankle, going downward and outward and emerging one and a half inches below the ankle. The patient was admitted to Frederick from his regimental hospital at Halltown two days after the injury. His general condition was not good; pulse 140. He had much pain in the ankle, which, with the foot, was much swollen and of a glistening surface. Pus, retained superficially on the inner side of the leg, was emptied by slitting down two inches; and a few small bits of bone about the size of peas, which were felt by the finger within the lower wound, were removed. Pressure over the outer ankle evacuated pus mixed with a yellow, clear, glairy fluid from the lower opening. Poultices were applied to the wounds and a general supporting treatment was ordered; milk punch and morphia at night. Two days after his admission the patient was better in all respects, and by March 31st he had still further improved, the treatment being continued and good food given. On April 4th the limb as well as the injured joint and the wounds were in a surprisingly good condition; redness and swelling gone; pain and tenderness of joint nearly gone; suppuration slight; nearly a corresponding improvement in patient's general condition. On April 28th a piece of bone about the size of a bullet, apparently from one of the tarsal bones, was removed, after which the condition of the foot and ankle improved very much. The patient was now able to sit up all day, and from this time he went on exceedingly well, being almost without pain or any trouble in the joint. He walked on crutches up to the time of his furlough on May 25th. When he returned from furlough in July he walked with a cane, the wounds having closed, leaving the ankle joint somewhat stiffened." He was subsequently transferred to Camp Parole, Annapolis, whence he was discharged May 2, 1865, and pensioned, Surgeon W. D. Stewart, U. S. V., certifying to "anchylosis of the ankle joint and extension of the foot" resulting from the wound. Examining Surgeon L. Darling, of Hammond Creek, Pennsylvania, October 7, 1874, certified to contraction of the gastrocnemius muscle and the tipping of the foot upon the toes, and added: "The pensioner's health is very feeble; he is weak and emaciated and has disease of the lungs." Examiner N. Parker, of Wellsborough, Pennsylvania, reported, June 17, 1880: "The injured leg at the calf is three inches smaller than the other; the weight is borne on the anterior part of the foot; pensioner quite lame. He states that nine months ago an ulcer formed at the outer side of the ankle and pieces of bone came out. There is slight inflammation and soreness at the site of the ulcer." The pensioner was paid September 4, 1880.

CASE 826.—Corporal C. B. Davis, Co. F, 9th New Hampshire, aged 23 years, was wounded and taken prisoner at Poplar Grove Church, September 30, 1864. He remained in captivity for nine days and was then paroled and conveyed to hospital at Annapolis, whence Acting Assistant Surgeon J. S. Fulks made the following report: "The patient came into my ward suffering from gunshot wound of the left ankle joint, inflicted by a minié ball passing transversely across and producing compound comminuted fracture. Sloughing commenced and continued until the integument over a considerable space around the wound was destroyed. Strong solutions of nitrate of silver and permanganate of potash failed to arrest the sloughing, but this was successfully accomplished by the application of a concentrated solution of nitric acid. The wound is now (December 31st) progressing favorably and the patient will recover with anchylosis of the joint." The patient was subsequently transferred to Webster Hospital, Manchester, where he was discharged from service May 27, 1865, and pensioned. Examining Surgeon T. Sanborn, of Newport, N. H., certified, August 2, 1865: "The fracture appears to have been a comminution. The tendo-achillis sloughed away and the ankle is anchylosed. The toes point downward and the heel cannot be brought to the ground." Examiner W. W. Sleeper, of Salisbury, N. H., reported, September 5, 1873: "The ankle joint is deformed and stiff, causing the heel to be raised about four inches and obliging the pensioner to walk upon his toes. There is necrosis about the joint, which has discharged several pieces of bone but is now healed. The muscles of the leg are much diminished." The deformity and anchylosis of the joint continued at the time the last payment was made to the pensioner, on June 4, 1881.

Of the ninety-nine fatal cases of shot fractures of the ankle joint treated conservatively, death was ascribed to pyæmia in twenty-five and to tetanus in five instances:

CASE 827.—"Private J. Jiggen, Co. B, 10th Wisconsin, was wounded at Chickamauga, September 19, 1863, by a minié ball, which entered the inner side of the right ankle below the malleolus, passing through the joint and making its exit on the anterior portion of the instep. He was taken prisoner and remained within the enemy's lines until October 2d, when he came through and was admitted into the general field hospital of the 1st division, Fourteenth Corps. The appearance of the wound and limb was then healthy and considered favorable to recovery until October 14th, when the patient was attacked with rigors The limb also commenced to swell about this time, which was accompanied by a cessation of discharge. Poultices were applied to the wound and free incisions were made to favor the exit of pus. A stimulant and tonic treatment was administered and continued up to the time of the patient's death, which occurred on October 20, 1863, with all the symptoms of pyæmia. At the

post-mortem examination of the limb the astragalus was found to be fractured and the three cuneiform bones in a state of comminution. The articulating surfaces of the tibia and fibula together with that of the astragalus were blackened and eroded, and the cuboid and cuneiform bones with the articulating portion of the astragalus were in a complete state of disintegration." The history was reported by Surgeon W. M. Wright, 79th Pennsylvania, in charge of the hospital.

FIG. 332.—Posterior view of the bones of the right ankle. *Spec.* 2188.

CASE 828.—Private J. Conly, Co. A, 90th Illinois, aged 18 years, was wounded in the right leg, at Mission Ridge, November 25, 1863. He remained under treatment at a field hospital for four weeks, and subsequently he was an inmate of the Chattanooga general hospital until the following February, when he was transferred to hospital No. 1, at Nashville. Surgeon C. W. Hornor, U. S. V., in charge of the latter, recorded the following description and result of the injury: "A gunshot fracture of tibia and fibula by a minié ball, which entered three inches above the external malleolus, fracturing the bone, and passing downward and inward. The missile was removed at a point one inch internal to the inner malleolus, its presence being suspected only by the formation of an abscess over the seat of its lodgement a few days before its extraction. The patient died March 7, 1864. At the *post-mortem* examination old and strong pleuritic adhesions were discovered at the apex of the right lung, which contained a few dormant tubercles; the remainder of the lung tissues were healthy. The bronchial mucous membrane was slightly inflamed. The heart was healthy and contained neither light yellow nor blood clots in its cavities, and the blood in the heart as well as in the vessels was remarkable for its fluidity. The liver was healthy and weighed four pounds and one ounce; spleen very soft and puffy and weighing eleven and a half ounces; kidneys healthy, the right one weighing five and a half ounces and the left one six ounces. The stomach and bowels were in a healthy condition. On examining the cranium the vessels were found very much distended with blood. The arachnoid cavity contained serum; the organs otherwise were healthy." The bones of the injured ankle (*Spec.* 2188) were contributed to the Museum by Acting Assistant Surgeon H. C. May, and are represented in the wood-cuts (FIGS. 332, 333), revealing that the tibia was split into the joint and showing the fractured portions of the bones to be carious, the articulation being destroyed by suppuration.

FIG. 333.—Anterior view of the bones of the right ankle. *Spec.* 2188.

CASE 829.—Private W. H. Perry, Co. C, 1st Massachusetts Heavy Artillery, aged 39 years, received a gunshot fracture of the right tibia and fibula, also flesh wounds of both lower extremities, and a wound of the thorax, at Spottsylvania, May 19, 1864. He entered Lincoln Hospital, at Washington, three days afterwards, where he died of pyæmia May 30, 1864. The history, with the pathological specimen (No. 4580), represented in the accompanying cut (FIG. 335), was contributed to the Museum by Assistant Surgeon J. C. McKee, U. S. A. The specimen consists of the greater portion of the bones of the right leg, showing the fibula to be transversely fractured in the lowest fourth and the anterior portion of the tibia shattered into the ankle.

FIG. 335.—Tibia shattered into the right ankle joint.—*Spec.* 4580.

CASE 830.—Corporal M. Martin, Co. D, 28th Massachusetts, aged 27 years, was wounded at Hatcher's Run, March 25, 1865. Surgeon F. M. Hammond, 126th New York, reported his admission to the field hospital of the 1st division, Second Corps, with "shot wound of left foot." Ten days after the reception of the injury the patient was transferred to Douglas Hospital, Washington, whence Assistant Surgeon W. F. Norris, U. S. A., contributed the pathological specimen shown in the annexed wood-cut (FIG. 334), with the following history: "The wound penetrated the ankle joint. The ball entered in front, about midway between the malleoli, and made its exit posteriorly and a little above the external malleolus, comminuting in its course the lower ends of the tibia and fibula. There was marked constitutional disturbance, headache, high fever, rapid pulse, and loss of appetite. But little swelling or inflammation in the joint, however, took place, and not much discharge. The day subsequent to the patient's admission the joint was carefully examined, when both bones were found to be much comminuted and amputation was decided as the only resort giving a fair chance of recovery. The patient, however, positively declined all operative interference. Towards evening he had a slight chill. On April 7th there was nausea and vomiting, and on the following day he had three chills, followed by fever and profuse sweats. Nausea and vomiting continued, the fluid ejected being tinged with bile; the discharge from both wounds, however, retained its healthy appearance. On April 9th, 10th, 11th, and 12th the patient had a chill each day, and on the latter day there was marked yellowness of the face and conjunctivæ; slight cough and delirium. On April 13th there was another chill; pulse 110, respiration 38; severe pleuritic pain in the right side of the chest. Death occurred on April 14, 1865. Rigor mortis was well marked at the autopsy, also the yellow hue of the skin and conjunctivæ. On opening the thoracic cavity nearly a pint of intensely yellow fluid was found in the right pleural cavity. Each lobe of the right lung presented numerous patches varying in size from half an inch to two inches in diameter, most of which on incision gave exit to pus; the left lung contained similar patches in both lobes. The spleen was much softened, being almost semifluid in consistence; liver enlarged but apparently healthy; other thoracic and abdominal viscera normal." The specimen (No. 253) consists of the astragalus and the lower halves of the tibia and fibula of the injured limb, the extremities of both bones of the leg being shattered.

FIG. 334.—Shattered bones of the left ankle joint. *Spec.* 253.

CASE 831.—Private G. Abbott, Co. K, 9th Minnesota, aged 39 years, was wounded in the left foot, at the battle before Nashville, December 15, 1864, and admitted to hospital No. 8 the same day. Two days afterwards the patient was placed under the influence of chloroform, when the wound was examined and ascertained to have been caused by a minié ball, which entered at the outer aspect of the instep, passed inward and upward, and emerged one inch below the inner malleolus, badly fracturing

the cuboid, scaphoid, and head of astragalus, and channelling a large passage through these bones. The patient being a robust man, it was thought advisable to attempt to save the limb and to trust to nature to repair the injury. Irrigation was found serviceable to keep down and control the inflammation, swelling, and pain. The discharge was limited for some days, but profuse towards the last. On December 28th an abscess over the inner malleolus was opened, causing a free evacuation of pus. Two days later suppuration was free from the posterior part of the leg as well as about the foot. Lead wash and tight bandaging was applied. From December 30th the patient commenced to fail. He became very icteric in appearance, his pulse rapid, and the discharge from the wound unhealthy. On January 2d he was delirious, and on the following day, January 3, 1865, he died. At the autopsy all the internal organs were found remarkably healthy. The ankle joint was filled with pus and there were sinuses extending up the leg. The capsular ligament of the ankle joint was found to be nearly destroyed, and the articular extremities and surfaces of the bones were eroded. The history, with the specimen (No. 3755), consisting of the calcaneum, the fractured astragalus, cuboid, and scaphoid bones, was contributed by Acting Assistant Surgeon H. C. May.

In one of the ninety-nine fatal cases of shot fracture of the ankle joint the tibial artery was ligated, in another the femoral:

CASE 832.—Private W. Lazier, Co. M, 5th Artillery, aged 25 years, was wounded in the right ankle joint, at Brandy Station, August 1, 1863, by a bullet, which entered close to the anterior edge of the internal malleolus, slightly comminuting it. On the following day he was conveyed to Douglas Hospital at Washington. The missile was supposed to have lodged, there being no external wound of exit and the patient not being aware of it having been removed. On the next day Assistant Surgeon W. Thomson, U. S. A., in charge of the hospital, etherized the patient and explored for the missile, but it could not be found. The comminution was so slight that it was deemed possible to save the foot with the aid of free incisions should they become necessary. A prescription consisting of two drachms of fluid extract of rhubarb, one scruple of quinine, and three ounces of whiskey was ordered, on August 5th, to be given in teaspoonful doses every four hours. Dead bone having been felt with the probe, and the inflammation becoming so extensive and severe as to render operative interference necessary, two large incisions were made at the sides of the internal malleolus on August 8th, by Acting Assistant Surgeon C. Carvallo, and several loose fragments of bone were extracted. On this day the patient also had a chill of ten minutes' duration, and one-half drachm of quinine dissolved in four ounces of whiskey was prescribed to be taken in tablespoonful doses. On August 11th the inflammation became erysipelatous, involving the leg below the knee, and there was another chill. The quinine and whiskey mixture was then repeated and tincture of iodine was used to the limb, after which a wash consisting of one-half ounce of muriate of ammonia, ten grains of acetate of morphia, two ounces of sulphuric ether, and one pint of water, was applied over it. On August 13th there was still pain, swelling, and redness, and another chill of fifteen minutes' duration took place. Fluctuation was well marked, and incisions were made to give free exit to pus. In addition to the quinine, tablespoonful doses of a mixture of two drachms of muriated tincture of iron, two ounces each of spirit of Mindererus and water, and half an ounce of simple syrup, were administered three times a day. On August 15th, incisions were again required over both malleoli and another on the calf of the leg to allow accumulated pus to discharge. The patient's condition was now too much depressed to allow an amputation. Two days later pleurisy developed, which was treated by counter-irritation of turpentine and alcohol fomentations to the breast, and mustard poultices. On August 18th the limb had grown very red, swollen, and painful as high as the knee, and, fluctuation being felt, another incision was made by Dr. Carvallo, after which the leg was placed in a bran-box, and the wash, with one-half drachm of fluid extract of hyosciamus superadded, was re-applied. Hæmorrhage from one of the incisions in the calf of the leg, and supposed to proceed from one of the muscular branches, came on one-half hour afterwards, when cold water, alum, and compression was applied, and Hoffman's anodyne mixed with brandy and water was given every half hour. Hæmorrhages recurred in the afternoon and evening, being decidedly arterial, and were checked by persulphate of iron applied with charpie. Though active interference was demanded, the undoubted disease of the lungs caused by metastatic abscesses from pyæmia, together with the very rapid and difficult respiration and the collapse of the patient from the loss of six or eight ounces of blood, made amputation impossible. The only other resort being ligation of the femoral, ether was carefully administered and that operation was performed at 9 P. M., at the point of election, by Assistant Surgeon Thomson, the leg being so distended with clotted blood as to make any effort to secure the divided vessels abortive. The clots of blood were removed from the leg by compression, and after the operation the case was treated with the largest doses of stimulants, including aromatic spirits of ammonia and fluid extract of senega. Though he reacted from the low state he was in before the operation, the patient gradually sank during the night and died at 8 A. M. on August 19, 1863. At the autopsy both lungs were found to be filled with metastatic abscesses; there was also effusion of serum in both thoracic cavities. No injured artery could be detected, nor could the missile be found. The detailed notes of the case were furnished by the operators. Dr. Thomson also contributed the bones of the injured ankle (*Spec.* 1682), showing the articular surfaces to be eroded by suppuration and the internal malleolus to be slightly fractured.

CASE 833.—Private W. Coakley, Co. K, 28th Massachusetts, aged 37 years, was wounded before Petersburg, June 18, 1864, and admitted to the field hospital of the 1st division, Second Corps, where Surgeon W. Vosburgh, 111th New York, recorded: "Shot wound of foot." Acting Assistant Surgeon E. C. Manoch reported the following description and result of the injury: "The patient entered the First Division Hospital at Annapolis June 21st. He was wounded by a piece of shell, which struck the inner aspect of the left ankle, fracturing part of the bones forming the joint. When first admitted the wound was doing well. On June 25th he was isolated, at which time he complained of very severe pain over the whole foot, which had become very much distended and increased in temperature. I ordered the parts to be painted with muriatic tincture of iron, also the tincture to be given internally, and whiskey and beef-tea. The next day the pain in the foot had grown very intense and the patient's face presented a very anxious appearance, he having passed a very restless night. On June 27th his general condition was the same; pulse rapid and weak. The skin at the external front of the ankle now presented a purple appearance, being soft and fluctuating on pressure. An incision gave exit to several ounces of foul pus, after which charcoal and yeast poultices were applied. In the evening the discolored part assumed a decidedly gangrenous appearance. The patient sank rapidly notwithstanding the strong stimulation with plenty of beef-essence, and he died early in the morning of June 29, 1864."

CASE 834.—Dr. D. A. Hoffman, pension examining surgeon at Oskaloosa, Iowa, reports that "Brigadier General S. A. Rice, U. S. V., was wounded at the battle of Jenkins's Ferry, April 30, 1864, a ball entering the external malleolus of the right ankle, carrying with it a portion of his spur and strap, and passing through the ankle joint. I learned from the surgeon who accompanied him that previous to his return home he had several attacks of erysipelas On June 1st I examined him and found him suffering with pyæmia and an unhealthy condition of the system generally, and the wound discharging unhealthy pus. On June 15th the patient had another attack of erysipelas in the wound. During the treatment of the case several pieces of bone were removed. Despite all remedies he gradually grew worse, and died July 6, 1864."

EXCISIONS AT THE ANKLE JOINT FOR SHOT INJURY.—During the American civil war thirty-three excisions at the ankle joint for shot injuries were performed.[1] The results in two cases were not ascertained; twenty-two patients survived the operation and nine died, a mortality rate of 29.0 per cent. As indicated in the following table eleven were primary, eight intermediary, and nine secondary operations; in five either the date of injury or operation, or both, could not be ascertained.

TABLE LXXXVIII.

Numerical Statement of Thirty-three Excisions at the Ankle Joint for Shot Injury.

It is noticeable that although excision at the ankle joint had been performed in the latter part of the last century by the elder Moreau,[2] and had frequently been repeated, for simple and compound fractures or caries, in the early part of the present century, the operation, prior to the breaking out of the War of the Rebellion in 1861, had only been done three times for shot injuries.[3] The first operation was performed in the English army during the Crimean War; the lower end of the fibula was excised and the case terminated in recovery; no details are recorded.[4] The second was performed, May 30, 1859, by Von Langenbeck on a Russian General wounded at the Alma, September 20, 1854, in the left

[1] From the records it would appear that the first excision of the ankle joint during the American civil war was performed by Assistant Surgeon J. S. BILLINGS, U. S. A., on January 6, 1862, for an axe wound involving the external malleolus and the scaphoid bone. The case will be detailed in the next chapter. The first total excision of the ankle joint for shot injury was performed by Surgeon E. BENTLEY, U. S. V., on October 9, 1862, in the case of Private J. Brennan, 16th West Virginia. Details of the case will be given hereafter.

[2] JEFFRAY (JAMES), *Cases of the Excision of Carious Joints by* H. PARK *and* P. F. MOREAU, *with observations*, Glasgow, 1806, p. 140, Case V. On April 15, 1792, the elder MOREAU excised the ends of the tibia and fibula and the articulating surface of the astragalus for caries in the case of M. Lucot, who walked without any assistance whatever nine months after the operation.

[3] The case related by FAURE (*L'amputation étant absolument nécessaire dans les plaies compliquées de fracas des os, etc.*, in *Prix de l'Académie Royale de Chirurgie*, Paris, 1819, T. III. p. 352) and cited by CULBERTSON (*Excision of the Larger Joints of the Extremities.* Prize Essay. *Trans. Am. Med. Assoc.*, Philadelphia, 1876, Supplement to Vol. XXVII, p. 280) and others as the first instance of excision at the ankle joint, can only be regarded as an instance of expectant conservative surgery. The articular surfaces of the tibia, fibula, and astragalus were fractured by shot at the battle of Fontenoy, May 11, 1745, in a soldier named Charles d'Amiens. Dr. RÉAD examined the wound and proposed to amputate the leg, but desisted at the urgent request of the patient. He then removed the detached portions of the tibia, fibula, and astragalus, placed the foot in proper position and secured it by a suitable apparatus. The patient recovered with good use of limb in about four months.

[4] MATTHEW (T. P.) *Med. and Surg. Hist. of the British Army which served in Turkey and the Crimea, etc.*, London, 1858, Vol. II, in tabular statement on page 368 and brief reference on p. 379.

ankle; the astragalus and the internal malleolus were removed by subperiosteal resection; the patient recovered without shortening of the limb; the joint became anchylosed.[1] The third was performed on a soldier wounded at Solferino, June 24, 1859. J. Neudörfer, several months after the injury, excised the roughened bony surfaces and several osteophytes that impeded the motion of the joint; the patient recovered rapidly with a useful limb.[2]

Primary Excisions at the Ankle Joint.—A complete excision of the ankle joint, in which portions of all the bones forming the articulation were removed, was performed in one only of the eleven primary operations; the patient recovered. The articular end of the fibula was excised in five cases, of the tibia in two, of the tibia and fibula in one, and of the astragalus in one; in the remaining case the portions removed were not indicated. Eight patients recovered, two died; the result in one case could not be ascertained. Details of the cases are subjoined:

CASE 385.—Private T. Bell, Co. H, 60th Illinois, aged 19 years, was wounded in the left ankle during the engagement near Marietta, July 4, 1864, by a minié ball, which fractured the lower end of the fibula. He was conveyed to the field hospital of the 2d division, Fourteenth Corps, where the excision was performed. The patient passed through different field hospitals and subsequently through various general hospitals. Surgeon B. B. Breed, U. S. V., in charge of hospital No. 1, Nashville, in reporting the case described the operation of excision as having involved the removal of three inches of bone from the fibula. Acting Assistant Surgeon W. Sturgis reported that when the patient entered Camp Butler, December 5th, his general health was bad. Erysipelas supervened, which was treated locally by linseed poultice and iodine, and internally by quinine, tincture of chloride of iron, etc. The patient was ultimately discharged from service June 29, 1865, and pensioned. Examining Surgeon J. Robbins, of Quincy, Illinois, certified, June 30, 1865: "A ball passed through the leg antero-posteriorly, just above the external malleolus, shattering the fibula and severing the tendo-achillis. Three inches of the lower extremity of the fibula have been removed, and complete anchylosis as well as the loss of bone and tendon render the limb useless." Numerous subsequent examiners have corroborated Dr. Robbins's certificate. The pensioner was paid September 4, 1880.

CASE 836.—Private B. B. Evitts, Co. I, 11th Connecticut, aged 23 years, was wounded in the left ankle, before Petersburg, June 18, 1864. He was conveyed to hospital at Fort Monroe, thence to McDougall, New York Harbor, and lastly to Brattleboro.' Acting Assistant Surgeon N. G. Brooks, in charge of the latter hospital, reported the man's admission, August 6th, with "shot fracture of tibia, followed by excision of the internal malleolus the day after the injury and favorable progress subsequently." The patient was transferred to the Veteran Reserve Corps February 11, 1865, and five months later he was mustered out of service and pensioned. Examining Surgeon C. B. Maltbie, of Falls Valley, Connecticut, June 28, 1868, certified: "The pensioner was wounded by a minié ball entering the ankle joint from the tibial side and lodging therein, from where it was extracted. The injury rendered the joint stiff and incapacitated the man for manual labor. Use of the limb caused the wound to reopen last season and to discharge freely." No changes were reported at subsequent examinations. This pensioner was killed by falling from a locomotive engine July 19, 1875.

CASE 837.—Private J. W. Bloyd, Co. H, 11th West Virginia, aged 18 years, was wounded in the left ankle during the fight at New Creek, August 4, 1864. He was conveyed to the Post Hospital at New Creek, where partial excision of the joint was performed, on August 5th, by Acting Assistant Surgeon W. B. Crain, who reported the following description of the injury: "A conical ball penetrated the tissues on the outer aspect of the leg, one and a half inches above the external malleolus, fracturing the fibula and burying itself in the ankle joint between the astragalus and the tibia. The articular surface of the astragalus was considerably comminuted, and that portion of the articular surface and cancellated structure of the tibia external to the groove of the flexor longus pollicis was also badly comminuted. The external surface was apparently uninjured. The operation was performed by slightly enlarging the wound on the outer aspect of the leg, where three large spiculæ were removed from the fibula. The ball and all the loose fragments were then extracted, and the rough spiculæ of the fractured portion of the tibia and astragalus were gouged and chiseled out. The constitutional state of the patient at the time of the operation was in every respect favorable, and the limb was but little swollen, but very painful. The patient did well until August 27th, at which time he began to suffer very much from pain, owing to a great accumulation of pus in the joint. To relieve this and to insure a free and constant outlet a large-sized seton was introduced into the wound in the outer aspect of the leg, carried obliquely between the articular surfaces of the tibia and astragalus and passed out in front of the external malleolus. An apparatus similar to Smith's anterior splint was also adjusted to the limb in order to insure greater comfort." After he became convalescent the patient was transferred to hospital at Cumberland, where he was discharged from service May 6, 1865, and pensioned. Dr. J. C. Hupp, of Wheeling, and other examining surgeons have, at successive periods, certified to the injury. In 1873, the injured ankle and also the lower third of the leg was reported as being enlarged, the extensors of the foot as acting imperfectly, etc. Subsequently the mobility of the ankle joint was described as impaired. The pensioner was paid June 4, 1880.

CASE 838.—Captain A. F. Miller, Co. K, 48th New York, aged 38 years, was wounded in the right ankle, at Cold Harbor, June 2, 1864. He was admitted to the field hospital of the 3d division, Sixth Corps, and thence, several days afterwards, to the Seminary Hospital at Georgetown. Surgeon H. W. Ducachet, U. S. V., in charge of the latter hospital, reported that the patient obtained leave of absence on June 13th and proceeded to his home. On January 13, 1865, the patient was discharged

[1] VON LANGENBECK (B.), *Ueber die Schussfracturen der Gelenke und ihre Behandlung*, Berlin, 1868, p. 46, and GURLT (E.), *Die Gelenk-Resectionen nach Schussverletzungen*, Berlin, 1879, p. 133.

[2] NEUDÖRFER (J.), *Die Endresultate der Gelenkresectionen*, in *Wiener Medicinische Presse*, 1871, Jahrgang XII, p. 405.

from service and pensioned. Dr. G. T. Stevens, formerly Surgeon 77th New York Volunteers, subsequently contributed the following description of the injury and resection of the ankle, which he performed: "The wound was caused by a minié ball, which penetrated the ankle, entering just behind the outer malleolus, passing nearly through the bones, and lodging in the inner side of the tarsus. The os calcis and astragalus were badly shattered. Two days after the reception of the injury the patient was brought under the influence of chloroform with intent to amputate; but after carefully inspecting the wound it was decided to attempt to save the foot. The wound was then enlarged by crucial incision, splinters of bone were removed, and the ball, which laid in the inner side of the ankle, was extracted. The shattered fragments of the os calcis and astragalus were then removed by a gouge and bone nippers, the wound was drawn together and water dressings were applied. On June 6th the patient was transferred to White House Landing in an army wagon, where he remained three days. Thence he was taken to Washington, and a week afterwards he went to his home in Brooklyn. Water dressings were continued. Extensive suppuration took place, and several deep incisions were made near the ankle. In about four weeks a considerable piece of dead bone came away, after which improvement was rapid. In injecting fluids into the original wound they passed freely through the ankle, coming out at an opening on the opposite side. In the course of eight weeks the patient was able to walk with crutches and from that time his recovery was rapid. He now (March 9, 1868) walks with little difficulty and there is no anchylosis." The Brooklyn and Boston Examining Boards in 1874, 1875, and 1877, respectively, certified to "anchylosis of the ankle joint, tendons bound down," etc. The pensioner was paid June 4, 1880.

CASE 839.—Private I. Ostheimer, Co. F, 66th New York, aged 31 years, was wounded in the right leg, at Antietam, September 16, 1862, and admitted to a Second Corps field hospital. Surgeon C. S. Wood, 66th New York, reported: "A minié ball struck the tibia anteriorly about four inches above the malleoli, shattering the bone. The fibula and bones of the foot were uninjured. I performed resection of the lower four inches of the tibia, removing the bone from the articulation, after which splints were applied to the leg; case sent to General Hospital." Acting Assistant Surgeon A. V. Cherbonnier recorded the patient's admission to hospital No. 5, at Frederick, where a large sequestrum was removed on November 22d, also that a large portion of the diseased tibia was resected on December 2d. About two weeks afterwards the wound assumed a healthy appearance, and by December 28th it was filling up with healthy granulations, the patient being cheerful and feeling well. On the next day he was transferred to hospital No. 1, where he remained until the following June, when he was sent to Patterson Park (Convalescent) Hospital at Baltimore. On August 10, 1863, the patient was returned to his command for duty, and while in the field he again came under the notice of Surgeon Wood, who made the following supplementary report: "The man laid in hospital for seven months before he could move his leg. Being possessed of a good constitution and no untoward symptoms appearing, at the end of that time he began to walk a little, and now—eleven months after the reception of the injury—he has just been returned to duty. On examination a large cicatrix is found, the bone having refilled its entire length and uniting with the astragalus with a moveable articulation. Although less than usual, the bone is not quite so long as its fellow, allowing the foot to turn slightly inward. Otherwise he has a very useful limb. He cannot endure hard marches as well as formerly, and probably never will. Still the case is one of interest, as not one in twenty saves his limb after the receipt of a like injury." According to information from the Adjutant General, U. S. A., this man has been reported as "missing in action" since the battle of Todd's Tavern, May 8, 1864.

CASE 840.—Private A. C. Rose, Co. H, 10th Illinois, aged 22 years, was wounded at Bentonville, March 21, 1865. Assistant Surgeon J. W. Brewer, U. S. A., reported his admission to the Seventeenth Corps Field Hospital with "shot fracture of left ankle," for which resection of fibula was performed by Surgeon W. A. Gott, 25th Wisconsin. From the field the wounded man was sent to Foster Hospital at New Berne, thence to McDougall Hospital at Fort Schuyler, and lastly, on August 18th, to DeCamp Hospital, David's Island. On September 23, 1865, the patient was discharged from service and pensioned, Assistant Surgeon W. Webster, U. S. A., in charge of the latter hospital, certifying to the disability resulting from fracture of the fibula. Examining Surgeon I. H. Ruden, of Lacon, Illinois, who examined the pensioner periodically, in 1866 described the injury as having been "followed by gangrene in the wound, which caused necrosis of one-third of the bone. Ankle nearly immovable and painful." Some years later he stated that "about two inches of the bone had been removed. The cicatrix is large and firm, so much so that the circulation of the foot is impeded, causing varicose veins; it is also so tender that he cannot wear a boot or high shoe. The ankle joint is not free in its movements, owing to adhesions of the tendo-achillis to the heavy cicatrix, and becomes swollen and painful when used to any considerable extent." The pensioner was paid June 4, 1880.

In the following three cases the limb was subsequently amputated, in two in the middle, in one in the lower third of the leg. Two of the patients recovered, one died:

CASE 841.—Sergeant M. G. Sparks, Co. I, 10th New Jersey, aged 25 years, was wounded in the right ankle, before Petersburg, April 2, 1865. He entered the field hospital of the 1st division, Sixth Corps, where Surgeon R. Sharpe, 15th New Jersey, recorded the injury as a "shot fracture of the fibula and tarsus," also that "resection of the fibula" was performed. The patient was subsequently transferred to the Depot Hospital at City Point, and from there, on April 12th, to Judiciary Square Hospital at Washington. Surgeon E. Griswold, U. S. V., in charge of the latter, reported that when the patient was admitted his constitutional state was not good and the injured parts were in a bad condition, necessitating amputation, which was performed by antero-posterior skin flaps at the middle third of the leg, on April 13th, by Acting Assistant Surgeon Z. P. Dennler. Chloroform and ether constituted the anæsthetic. After the amputation simple dressings were used and stimulants, etc., were administered. Subsequently the patient passed through various hospitals, and on February 2, 1866, he was discharged from service and pensioned. He was paid June 4, 1874, since when he has not been heard from.

CASE 842.—Private S. H. Myers, Co. E, 75th Indiana, aged 20 years, was wounded, before Kenesaw Mountain, June 21, 1864. He was admitted to the field hospital of the 3d division, Fourteenth Corps, where Surgeon F. Lloyd, U. S. V., recorded: "Shot fracture of left ankle; resection of two inches of tibia and fibula." One week afterwards the wounded man was sent to the General Field Hospital at Chattanooga, whence Assistant Surgeon C. C. Byrne, U. S. A., reported that amputation became necessary, and was performed by the circular method at the lower third of the leg by Acting Assistant Surgeon G. E. Stubbs,

on June 30th. The patient's subsequent progress was fair, the treatment consisting of water dressings, tonics, and stimulants. About two weeks after the amputation he was transferred to hospital at Nashville, and lastly he was admitted to Ekin Barracks, Indianapolis, where he was discharged from service March 7, 1865, and pensioned. In his application for commutation he stated that the first operation (meaning that of resection) was performed by Surgeon C. N. Fowler, 105th Ohio, five hours after the reception of the injury. The pensioner died April 12, 1872.

CASE 843.—Private G. W. Velic, Co. C, 24th Michigan, aged 28 years, was wounded at Cold Harbor, June 3, 1864. He entered the field hospital of the 4th division, Fifth Corps, where Surgeon C. N. Chamberlain, U. S. V., recorded: "Severe shell wound of ankle joint; excision of lower end of fibula." Ten days after the date of the injury the wounded man was transferred to Armory Square Hospital, Washington, where Surgeon D. W. Bliss, U. S. V., subsequently amputated the limb and recorded the result of the case as follows: "The injury was a lacerated wound of the right ankle, the outer malleolus being shattered and the joint opened. On June 28th the leg was amputated at the middle third. The circular flap operation was performed, the patient being under the influence of chloroform. On July 3d there was sloughing and sanious discharge from the stump. By July 12th there was hospital gangrene, which rapidly extended to the knee and was treated with nitric acid and yeast poultices. The patient died July 18, 1864."

CASE 844.—Private J. Durst, Co. D, 148th Pennsylvania, aged 24 years, was wounded in the left lower extremity, at Gettysburg, July 2, 1863, and admitted to the field hospital of the 1st division, Second Corps. Surgeon C. S. Wood, 66th New York, reported: "The lower portion of the fibula was shattered by a minié ball, and resection was performed of the articulation of the bone about four inches in length. The tibia remained sound. A splint was applied to the outer portion of the leg, and cold-water dressings. The case continued to do well, with a fair prospect of getting ultimately a very good limb." Three weeks after being wounded the patient was transferred to the Cotton Factory Hospital at Harrisburg, where Acting Assistant Surgeon W. S. Woods noted the case as one of "exsection of the left ankle joint," and recorded the following termination: "The patient, a man of irritable and nervous temperament, was suffering severely from the wound when admitted. There was considerable sloughing of the wound at the time, attended with deep-seated suppuration. Several spiculæ of bone were taken out. For a time the leg was placed in a cushioned box splint and the usual simple cerate and cold-water dressings were applied twice each day. The weather becoming unusually warm it was found necessary to suspend the leg in a cot splint, which proved to be far more comfortable. The same treatment was continued, a tonic course and liberal diet being allowed. By August 13th the wound granulated nicely and the patient was considered as doing well. He improved slowly until September 19th, when he had a severe chill, also pain in the inguinal glands, followed by traumatic erysipelas. For the first two days antiphlogistic remedies were advised, which were followed by quinine and whiskey. The leg was washed with glycerine and iodine. The case resulted fatally on October 6, 1863."

CASE 845.—Private *J. Radford*, Co. F, 14th Virginia, received a gunshot wound of the ankle joint May 9, 1864. Excision of the joint was performed on the following day, and the patient was subsequently transferred to General Hospital. The report of the case was contributed by Dr. H. L. Thomas, late Surgeon P. A. C. S., who obtained the record of the injury and operation from the notes of Confederate Surgeon J. S. Pride, Battle Hospital, Dublin Depot.

Intermediary Excisions at the Ankle Joint.—Of the eight excisions of this group five were successful, three fatal. In one case portions of the astragalus were excised, in one the extremities of the tibia and fibula, in four the extremities of the fibula, and in two the surfaces of the three bones forming the articulation were removed:

CASE 846.—"Private J. Brennan, Co. K, 16th West Virginia, aged 18 years, was admitted to hospital at Alexandria on October 6, 1862, with a wound of the right ankle joint, received accidentally the night previous. On examination it was found that a pistol ball had entered the ankle three-fourths of an inch posterior and inferior to the internal malleolus, passed forward and upward, rupturing the capsular ligaments and cutting its way between the articular surfaces of the tibia and astragalus and lodging within the joint. He was in good health at the time of the injury and evidently suffered no great amount of pain. He was freely purged and a light and nutritious diet enjoined. The question of procedure was exceedingly perplexing. The single small bullet hole and the slight local and constitutional symptoms presented a case apparently well adapted to the performance of resection, while the want of success attending this operation was a serious argument against its performance. It was decided, however, to resect the joint, which was done on October 9th. The patient being under the influence of chloroform, two lateral incisions were made about four inches in length, terminating three-fourths of an inch below the malleoli. The lips being drawn asunder, a chain saw was then applied to the tibia and about one-third of an inch of the extremity removed; the extremity of the fibula, on a level with the tibia, was removed through the opposite opening, and through the same aperture a portion of the articular surface of the astragalus was taken away. By this method the division of the extensor tendons and of the anterior tibial artery was avoided. The posterior tibial was uninjured. The incisions were closed with silver wire sutures, and the bones were held in apposition by means of adhesive strips extending down the sides of the leg and embracing the sole of the foot. Lateral splints of binders' board were applied. The hæmorrhage was trifling, no vessels having to be tied. On the following day there was considerable febrile excitement; pulse 100; skin hot and dry. Small doses of antimony and morphia were administered. On the next day the patient appeared more comfortable but complained of slight pain; pulse diminished in force and frequency. On October 12th the patient was comfortable; skin cool and moist; pulse 80 per minute. Discontinued the medicine. On October 13th suppuration was established and the patient was comfortable; limb suspended by means of Smith's anterior splint; lateral splints retained. From this time the dressings were daily removed. By October 16th the patient was doing well and the wound was discharging freely; diet light, though nutritious. Four days later he began to take solid food. On October 27th the incisions were filled with granulations. The dressings were continued to November 25th, when Smith's splint was removed, the lateral splint being still applied. The patient remained in bed until December 20th, when he

began to move about on crutches. The lateral splints were removed in the early part of February, at which time he moved about freely and with little embarrassment. In dressing, the toes of the injured side were extended so as to be on a line with those of the sound side. The advantage of this is apparent when a shoe with a high heel is worn. The elasticity of the instep thus brought into play compensates in a great measure for the anchylosis." The case is reported by Surgeon E. Bentley, U. S. V. The subsequent records in the case show the patient was mustered out at the expiration of his term of service, June 16, 1863. There is no record of his ever having applied for pension.

CASE 847.—Private N. Lloyd, Co. I, 29th Pennsylvania, aged 38 years, was wounded in the left ankle, at Gettysburg, July 1, 1863. He was admitted to the Twelfth Corps field hospital, where Surgeon H. E. Goodman, 28th Pennsylvania, noted that an excision at the lower third of the fibula was performed on July 12th by Surgeon J. A. Wolf, 29th Pennsylvania. Three weeks after being wounded the patient was transferred to Camp Letterman, several months later to hospital at Baltimore, and subsequently to Philadelphia. Acting Assistant Surgeon W. V. Keating reported his admission to Broad and Cherry Streets Hospital, December 11th, and described the injury as "a compound gunshot fracture of the external malleolus opening the ankle joint, followed, apparently, by resection of a very small portion of the malleolus. The patient apparently did not get along very well. On his admission the tissues around the ankle joint were considerably swollen and there were symptoms of chronic arthritis. A sinus on both the inner and outer side of the ankle connected with the joint, where the cartilages were found eroded and from which a sanious discharge issued. On January 23, 1864, when the patient was transferred to Mower Hospital, the swelling around the joint had somewhat diminished and the sinus on the inner side of the ankle had healed, while the one on the external side still discharged a slight amount of sanious pus." Surgeon J. Hopkinson, U. S. V., in charge of Mower Hospital, reported the result of the case as follows: "At the time of the patient's admission the wound was nearly closed, the joint stiff, the parts swollen, and circulation in the foot very feeble. The cold douche was used to the foot with marked benefit. By February 16th the foot was much better, the patient being able to place it on the floor and bear some weight on it. One month later the foot was rapidly improving and the treatment was discontinued." On April 20, 1864, the patient was discharged from service. Examining Surgeon T. B. Reed, of Philadelphia, February 5, 1866, certified to "compound fracture of left ankle, shattering the outer malleolus and requiring exsection of the same. Permanent anchylosis of ankle. The greatly impaired use of the foot has produced subsequent irritation of the knee joint, with rheumatism. Is obliged to use a cane or crutch constantly. Amputation of the foot and the use of an artificial limb would be a great improvement to his present condition." Subsequent examiners substantially confirm Dr. Reed's report. The pensioner was paid September 4, 1880.

CASE 848.—Private D. Stottlemeyer, Co. K, 66th Ohio, aged 17 years, was wounded in the right ankle joint, at Cedar Mountain, August 9, 1862, and entered Fairfax Seminary Hospital several days afterwards. Surgeon D. P. Smith, U. S. V., reported that the patient was discharged from service October 9, 1862, by reason of "exsection of lower third of fibula, anchylosis of ankle joint," etc. Examiner S. M. Smith, of Columbus, Ohio, certified, December 22, 1862: "He received a wound in the right ankle, a musket ball entering the outer portion of the joint, embedding itself in the bones of the joint and fracturing them. Eleven days afterwards the missile and portions of bone were removed. At present there is great enlargement of the joint and foot, complete anchylosis of the joint, an open wound and necrosis of bone." Examining Surgeon W. S. Constant, of Delaware, Ohio, November 4, 1880, certified to the injury and reported as its result "an occasional suppurating wound of the ankle, partial anchylosis of ankle joint, and shortening of limb from contraction, so that he can walk only on the ball of the foot. The pensioner cannot walk any distance or do much manual labor."

CASE 849.—Sergeant A. M. Wright, Co. C, 80th Indiana, aged 23 years, was wounded in the left ankle, at Resaca, May 14, 1864. Surgeon E. Shippen, U. S. V., reported his admission to the Twenty-third Corps field hospital, whence the wounded man was transferred to hospital at Chattanooga and afterwards to hospital No. 15, Nashville. Surgeon W. M. Chambers, U. S. V., in charge of the latter hospital, described the injury and reported that "the bone was fractured and necrosed," necessitating "excision of two and a half inches of the lower end of the fibula, which was performed on June 13th by Acting Assistant Surgeon J. J. O'Riley. Gangrene ensued the day after the operation, but was stopped by applying bromine. Simple dressings were used and nutritious diet and stimulants were administered." The patient subsequently was transferred to Joe Holt Hospital, and later to Lincoln Hospital, Washington. In the following March he was returned to duty, and on June 22, 1865, he was mustered out of service. Examining Surgeon H. M. Smith, of Vincennes, Indiana, March 31, 1877, certified: "I find on examination that the applicant received a wound in the ankle joint. The ball penetrated the lower part of the external malleolus and passed through the head of the tibia, making its exit on the front part of the ankle, at which point a large cicatrix exists—as if caused by sloughing—resulting in adhesions of the soft parts and partial anchylosis of the joint," etc. The pensioner was paid June 4, 1880.

In the following instance gangrene appeared three months after the excision, and amputation was performed in the middle of the leg:

CASE 850.—Private F. Thorn, Co. D, 63d Pennsylvania, aged 28 years, was wounded in the left lower extremity, at the Wilderness, May 5, 1864. Surgeon O. Evarts, 20th Indiana, reported his admission to the field hospital of the 3d division, Second Corps. Three weeks after the reception of the injury the wounded man entered Emory Hospital, Washington, where he underwent the operation of excision at the hands of Surgeon N. R. Moseley, U. S. V., who reported that "the injury consisted of a gunshot wound of the left ankle, the bones being comminuted and the soft parts lacerated, but in a favorable condition. On May 26th chloroform and ether was administered, and resection of the lower third of the fibula was performed. The parts were kept in coaptation by adhesive straps, and cold-water dressings were used." According to a subsequent report the patient obtained a furlough on July 16th and left the hospital for his home in Erie, Pennsylvania, where "Dr. R. Faulkner amputated the leg at the middle third, on August 17th, by reason of gangrene." Several months later the patient, who had in the meantime been assigned to the 105th Pennsylvania Volunteers, returned, and was transferred to Judiciary Square Hospital. After being supplied with an artificial leg he was discharged from service March 18, 1865, and pensioned. He was paid March 4,

1880. Five small fragments of the fibula, removed at the first operation by Surgeon Moseley, and contributed by him to the Museum, constitute specimen 2362 of the *Surgical Section*.

Three of the eight intermediary excisions at the ankle joint proved fatal—two from pyæmia and one from exhaustion:

CASE 851.—Private J. Davis, Co. L, 1st Michigan Cavalry, aged 18 years, was wounded at Salem Church, May 28, 1864. Surgeon W. H. Rulison, 9th New York Cavalry, reported his admission to the field hospital of the 1st division, Cavalry Corps, "with shot wound of left foot and hip." Surgeon J. A. Lidell, U. S. V., who operated in the case, made the following report: "The patient was admitted to Stanton Hospital, Washington, June 4th, with a gunshot wound of the left tarsus, inflicted by a minié ball, which struck the foot a little below the external malleolus and passed through the tarsus horizontally inward and somewhat backward, escaping a little below and behind the internal malleolus. It occasioned compound comminuted fracture of the calcaneum, astragalus, and posterior edge of the external malleolus. At the time of the operation, June 10th, the ankle and foot were much swollen, inflamed, and very painful; the leg was also swollen. The edges of the orifices of both entrance and exit were pouting and exhibited no tendency to close; discharge thin and scanty. Since the patient came to Stanton Hospital the wound had been treated with ice dressings, but was manifestly growing worse. He now had a good deal of constitutional disturbance; pulse quick and ranging from 110 to 120; skin dry and too warm; countenance pinched and anxious; tongue coated, and appetite poor. He was also restless, got but little sleep, and his general condition was daily getting worse. Wishing to avoid secondary amputation of the leg if possible on account of the great fatality which had lately attended it, resection was performed of the anterior extremity and part of the external side of the calcaneum. Some fragments of the astragalus were also extracted, and a splinter from the posterior edge of the external malleolus. The incisions were made on the external side of the foot, from the orifice of entrance, first, to the base of the metatarsal bone of the little toe; second, to the base of the external malleolus; third, to the point of the heel; and fourth, to the dorsum of the foot, two and a half inches. Sulphuric ether constituted the anæsthetic. There was no shock. Ice-water dressings were continued. On June 11th the patient was cheerful and free from pain and the swelling and irritative fever had abated. He died of pyæmia on June 20, 1864. Autopsy: The ankle joint contained pus; the bones were partially denuded of their cartilage; muscles of leg infiltrated with pus. The left pleural cavity contained a large quantity of dark-colored effusion, and the left lung was compressed against the vertebral column; the inferior lobe contained an abscess about the size of an egg, which was filled with dark-colored and offensive pus. The right lung contained several superficial abscesses and some patches of lobular pneumonia. Thrombi existed in the femoral vein." In his publication[1] of the operation the operator furnished the following supplementary details of the patient's progress, as well as of the autopsy, in addition to his comments on the case: After the operation "the limb was placed upon a wire splint (Smith's) bent to a right angle, which was well padded and applied to the posterior part of the leg and sole of the foot, where it was properly secured by roller bandages for the purpose of keeping the ankle joint in a fixed position. The wound was plugged with lint and a full opiate was given. The constitutional treatment consisted in the administration of nutrients, tonics, and stimulants. On June 12th the patient had a severe pyæmic chill and sweat, and quinine in full doses was added to the treatment. On the next day he was much worse; wound discharging a thin dark-colored pus; chills and sweats increasing in frequency and severity; complexion assumed a bronzed hue; breath bovine; body exhaling a sweet mawkish smell; anorexia; debility; diarrhœa set in. Pneumonic symptoms also appeared, and a large proportion of blood was mingled with the sputa. He sank rapidly. At the autopsy the calcaneum was found to be fractured entirely through and its cancellous structure was gangrenous. The astragalo-scaphoid articulation contained pus and the articulating surface of its bones was entirely denuded of its cartilage. The connective tissue on the front of the leg was infiltrated with pus from the ankle joint upward to the extent of three inches, and the tibia and fibula were denuded of periosteum to the extent of two inches. The liver and spleen were both enlarged and softened, but the kidneys presented a normal appearance. There were clots in both ventricles of the heart. Comments: In this case also osteomyelitis supervened, which was conclusively shown by the gangrenous condition of the cancellous tissue belonging to the calcaneum, or, rather, the gangrenous condition of the medullary tissue which filled the cancelli of that bone. Besides, it is probable that if the interior of the tibia and fibula had been examined the marrow would have been found inflamed at and above the place where those bones were seen to be denuded of periosteum at the *post-mortem* examination. It is also probable that the medullary tissue of the denuded portion of the tibia contained collections of purulent matter which were produced by the suppurative character of the inflammatory process involving that tissue. Furthermore, it is probable that the inflammatory process had extended to the medullary tissue of the tibia prior to the performance of the resection of the tarsus, and if its presence there had then been recognized, it would have contra-indicated that operation and called for amputation far up the limb. The thrombosis of the femoral vein was of recent occurrence. The coagulated blood which filled that vein presented a fresh appearance and had not yet undergone the puriform transformation, nor even become at all softened. It was therefore obvious that the thrombosis had not occasioned the visceral abscesses nor the inflammation of the lungs, since the morbid process in those organs was considerably older than the thrombus of the femoral vein. The thrombosis was a more recent event than the pyæmia. This circumstance is important, because it shows that the pyæmic process in this case could not have had its origin in the thrombosis, and that if any relationship or necessary connection existed between them, the pyæmic process induced the formation of the thrombi. The symptoms of irritative fever (or, speaking properly, the surgical fever of an irritative type), which where so strikingly relieved by the operation, had been produced entirely by local causes, namely, the inflammation of the various structures bordering upon and connected with the gunshot wound, such as the connective, the fibrous, the osseous, and the medullary tissues. The symptoms of the purulent infection did not make their appearance till two days after the operation. They presented a marked contrast to those of the surgical fever which preceded the operation. They denoted the occurrence of a poisoned condition of the blood and the whole system, under which the patient sank rapidly, and died on the eighth day after its advent."

[1] LIDELL (JOHN A), in *U. S. Sanitary Commission Memoirs*, Surgical Volume I, pp. 524–6, and CULBERTSON (H.), *Excision of the Larger Joints of the Extremities*, in *Transactions of the American Med. Association*, Philadelphia, 1876, Supplement to Vol. XXVII, p. 314.

CASE 852.—Private J. F. Geer, Co. F, 112th New York, aged 22 years, was wounded at Cold Harbor, June 2, 1864. Surgeon S. A. Richardson, 13th New Hampshire, recorded his admission to the Eighteenth Corps field hospital with "shot wound of left ankle." Surgeon R. B. Bontecou, U. S. V., contributed the following description of the injury and operation in the case, which he performed: "The patient was admitted to Harewood Hospital, Washington, June 15th, suffering from a wound of the left ankle, the ball passing from the inner to the outer surface, opening the joint. On admission the condition of the injured parts and the constitutional state of the patient was good. On June 25th resection of the injured joint was performed by lateral vertical incisions over the malleoli, exposing the articulation. The ends of the tibia and fibula were cut off by the chain saw, and the upper portion of the astragalus was removed by the cutting forceps. Sulphuric ether was used. Two days after the operation the patient had slight febrile movement and his pulse was a little accelerated. The treatment was supporting; simple dressings were used. Death occurred on July 24, 1864."

CASE 853.—Sergeant W. Roberts, Co I, 7th New York Artillery, aged 35 years, was wounded in the left ankle, at Cold Harbor, June 10, 1864, by a conoidal ball, which passed from before backward, fracturing the external malleolus and opening the ankle joint. He entered Harewood Hospital, Washington, five days afterwards, at which time his constitutional state was very poor, the injured parts were in a very bad condition, and the wound discharged fetid pus. Resection of the ankle joint was performed on June 24th by Surgeon R. B. Bontecou, U. S. V., who exposed the articulation by incisions over the malleoli and excised the lower articular extremities of the tibia and fibula. Sulphuric ether was used. The patient did well up to July 1st. From that period diarrhœa set in and he gradually sank. There were no pyæmic symptoms. He died July 6, 1864, from exhaustion. The history was reported by the operator.

Secondary Excisions at the Ankle Joint.—Of nine secondary operations the articular surfaces of the fibula were excised in two, of the tibia and fibula in two, of the astragalus in one, of the tibia and astragalus in two, and of the tibia, fibula, and astragalus in two instances. Five patients recovered, four died.

CASE 854.—Sergeant C. Barber, Co. E, 88th Pennsylvania, aged 30 years, received a shot fracture of the fibula of the left leg, at Gettysburg, July 1, 1863. From a First Corps field hospital he passed to York and subsequently to Philadelphia. Acting Assistant Surgeon M. K. Knorr recorded the following description of the case at the South Street Hospital, where the patient was admitted August 14th: "The wound was caused by a minié ball passing in above the external malleolus, fracturing the bone, and passing through the interosseous space. About August 20th hospital gangrene set in and the wound filled with large sloughs; patient became very weak. Stimulating poultices of yeast and flaxseed were then used, and pulverized persulphate of iron was applied to the slough. After three applications the patient appeared much better and the slough came off. Poultices were now continued for a while, and afterwards stimulating applications. Still the wound was not healing, the discharge being yet great and the patient's constitutional state extremely low and weak. On examination Surgeon C. N. Chamberlain, U. S. V., found the bone to be necrosed and denuded of periosteum, and concluded to excise the fibula. This operation was accordingly performed on December 19th, it being deemed necessary to remove three-fourths of the length of the bone, including the external malleolus. The patient rallied from the operation and made rapid improvement. Tonics and stimulants were given and simple dressings used." Surgeon H. Janes, U. S. V., subsequently in charge of South Street Hospital, reported, in April, 1864, that the wound had healed with the exception of the upper part, where a small sinus still existed. The patient was afterwards transferred to Filbert Street Hospital, and on September 17, 1864, he was discharged from service and pensioned. Examining Surgeon H. L. Hodge, of Philadelphia, certified, December 21, 1864: "The limb is now much swollen, the ankle is painful and the foot turned outward. He is very lame and the limb is useless." The Philadelphia Examining Board, April 10, 1872, certified to the injury and operation and described the result as follows: "A long cicatrix with musculo-fascial adhesions; a slight varicose condition with tenderness about the ankle joint, and anchylosis of the ankle joint with atrophy of muscles on posterior portion of leg. Increase of pension is recommended on account of increased pain and firmness of anchylosis of the ankle joint."

FIG. 336.—Outer view of left leg 18 years after excision of the lower three-fourths of fibula. [From a photograph.]

FIG. 337.—Anterior view of the same. [From a photograph.]

In a communication dated April 18, 1881, accompanying the photographs represented in the annexed wood-cuts (FIGS. 336, 337), the pensioner stated that "the ankle is very painful at present," and added that his disability had obliged him to give up working at his trade of stone cutter.

CASE 855.—Private W. A. Gavett, Co. K, 141st Pennsylvania, aged 43 years, was wounded in the right ankle during the engagement near Bristoe Station, October 13, 1863, and entered Judiciary Square Hospital, Washington, three days afterwards. Assistant Surgeon A. Ingram, U. S. A., made the following report: "The wound was caused by a minié ball, which entered at the internal malleolus, passed into the ankle joint and lodged. The missile was extracted the next day through the wound of entrance. Partial excision of the ankle joint was performed on February 1, 1864, by Acting Assistant Surgeon J. F. Thompson. An incision two and a half inches in size was made on the outer side of the ankle and several pieces of bone were taken out. Part of the internal malleolus was dissected from the integument and removed through the enlarged wound of entrance, and a portion of the astragalus was taken away with the bone forceps. At the time of the operation the patient's general health was excellent, but considerable inflammation existed around the ankle joint and there was great discharge of pus

from the wound. A collection of pus had also formed on the outer side at the point of the internal incision. The patient did well for about a month after the operation, at which time both sides had healed. A day or two afterwards an abscess was detected in front of the joint, which, on being opened, discharged considerable pus. Carious bone could be felt by the probe, indicating the necessity of another operation." The patient was subsequently transferred to Philadelphia, where he was admitted to Summit House and afterwards to Satterlee Hospital. On May 6, 1865, he was discharged from service and pensioned. Examining Surgeon C. M. Turner, of Towanda, Pennsylvania, December 27, 1865, certified to the injury and added: "Of course anchylosis has taken place and the tendons of the foot and toes are in a degree contracted and rigid." On August 16, 1869, he reported that the pensioner "walks with difficulty and has much pain after exercise. The joint is often inflamed, and abscesses form in the integuments, which discharge pus for many days. I do not think the joint is carious," etc. At subsequent dates the same examiner certified to the heel bone being diminished in size, and to the leg being atrophied up to the knee and shortened two inches. Examiner C. F. Paine, of Troy, Pennsylvania, September 22, 1879, reported "fistulous openings, constantly discharging portions of bone. The pensioner is compelled to use a crutch or cane for locomotion." The pensioner was paid June 4, 1880.

CASE 856.—Sergeant W. H. Gaylord, Co. B, 6th U. S. Colored Artillery, aged 26 years, was wounded at Fort Pillow, April 12, 1864, by a minié ball, which fractured the fibula of the right leg at the lower third. The missile entered above the external malleolus, passed obliquely downward and backward, and emerged below and behind the internal malleolus. Four days after the reception of the injury the wounded man was admitted to Adams Hospital at Memphis, where Surgeon J. G. Keenon, U. S. V., on May 21st, excised the external malleolus, the comminuted fragments of the fibula, and the end of the tibia through a semilunar incision two inches long. Chloroform was used and the hæmorrhage was slight. The patient's physical condition at the time of the operation, though somewhat emaciated, was fair and his spirits were buoyant. The wound, which had been suppurating freely, was closing by healthy granulations, but necrosed bone could be distinctly felt. The patient did well after the operation. He was permitted to leave the hospital and go to his regiment on June 7th, before his cure was complete. The history was reported by the operator. Sergeant Gaylord was subsequently promoted to Lieutenant, and remained in the service until March 28, 1865, when he was discharged, Surgeon G. Perin, U. S. A., as a member of an examining board certifying to the injury, and adding that the "wound is healed and ankle joint partially anchylosed. Cannot walk without a crutch." The Cleveland Pension Examining Board, Drs. G. C. Ashmun and P. Roeder, in 1877, add that there is "slight lateral motion of ankle, constant enlargement," etc. The pensioner was paid September 4, 1880.

FIG. 338.—Excision of right ankle joint. Outer view 17 years after operation. [From a photograph.]

FIG. 339.—Inner view of the same injury.

CASE 857.—Private E. Roberts, 7th Wisconsin Battery, aged 26 years, was wounded in the right foot, at Parker's Cross Roads, December 30, 1862. Surgeon E. D. Kittoe, U. S. V., recorded his admission to hospital at Jackson, and several months afterwards the wounded man was transferred to Jefferson Barracks, whence he was discharged October 6, 1863, and pensioned. Surgeon J. C. Whitehill, U. S. V., subsequently contributed the following report of the case: "Understanding from Surgeon H. W. Davis, 18th Illinois, who was in charge of the General Hospital at Jackson for some time in the early part of 1863, that some doubts had been expressed concerning the removal of the os calcis and astragalus from a patient in that institution, and his recovery with a foot of comparatively good conformation and use of the ankle joint, I desire to set the matter at rest by furnishing a detailed report of the case. In the latter part of March, 1863, while passing through the wards of the General Hospital at Jackson in the discharge of my duties as Medical Director of the district, my attention was called to a case—that of Private Roberts, 7th Wisconsin Battery—supposed to require amputation. He had been wounded in the heel by a rifle ball, which grazed the posterior tuberosity of the os calcis and passed out through the sole of the foot about two inches forward. Under the usual treatment the wound soon healed. The heel, however, remained tender, and the tenderness gradually increased; the integuments became œdematous and glazed; the pain more acute and deep seated; constitutional symptoms supervened; the wound re-opened, and in spite of all treatment the patient's condition gradually grew worse. He had now hectic fever, some bronchial irritation, diarrhœa, and impaired appetite; the foot and ankle were swollen; the integument of the heel was an intense dusky or purplish red, tense, and glistening, and three sinuses over the posterior part of the os calcis, with everted edges, were discharging fetid sanious pus. Through the sinuses the probe readily detected carious or necrosed bone. After a careful examination I determined to make an effort to save the foot by removing the os calcis, to which, judging from the location of the sinuses, I was in hopes the disease was yet confined. On April 1st, in the presence of Surgeon Davis in charge of the hospital, Surgeon H. E. Foote, 22d Ohio, the ward surgeons of the hospital, and several other medical gentlemen, the patient was placed comfortably on his side and anæsthesia was induced, after which I commenced an incision at the margin of the sole immediately behind the plantar artery, carrying it around the heel and along the outer margin of the foot to the tarso-metatarsal articulation, and then keeping the knife close to the bone dissected up the flap thus made and exposed the under surface of the os calcis. There was slight hæmorrhage from a posterior perforating branch of the plantar, but this was readily arrested by torsion of the vessel. A perpendicular incision of about two inches was next made over the heel and along the tendo-achillis, the tendon detached from the os calcis, and the lateral flaps and soft parts carefully dissected up so far as the calcaneo-astragaloid articulation, keeping the edge of the knife close upon the bone to avoid wounding the vessels, and, if possible, to preserve a portion of the periosteum, which was much thickened and in some places thickly studded with minute spiculæ of bone. The articulation was then opened, the interosseous ligaments were divided, and the bone readily removed. The articular surface of the astragalus being diseased, the gouge was used for its removal until, finding the greater portion of its structure involved, I decided to remove the entire bone. Keeping the knife close upon the posterior surface of the bone the dissection was continued to the ankle joint, which was opened, when by using the point of the finger as a lever and at the same time as a guide and sheath for the knife, the

bones were sufficiently separated to allow the ligamentous attachments to be divided by a careful application of the point of the knife. The greatest caution was used on the inner side to avoid wounding the plantar vessels and to preserve the periosteum, which, at this point, like that of portions of the os calcis, was thickly studded with minute spiculæ or corpuscles of bone. After making a careful dissection to free the bone from its remaining attachments the entire astragalus was removed. Finding the other articular surfaces healthy the wound was carefully cleansed, the parts coaptated, light water dressings applied, and the foot and leg fixed in a position by a suitable splint so arranged as to retain them firmly without interfering with the dressings of the wound. No part of the integument was removed, nor did a single vessel require ligation. Surgeons Davis, Foote, and several other medical gentlemen, by attending to the administration of the anæsthetic and affording other assistance, rendered efficient aid during the progress of the operation, which, from the large amount of careful dissection required, was necessarily somewhat tedious. The subsequent treatment consisted in the main of a careful retention of the parts in position, simple water dressings and a generous diet, with wine, ale, and porter. A free suppuration of healthy pus was established; the redness and tumefaction of the integuments subsided; the cavity of the wound gradually filled with healthy florid granulations; and when I last saw the patient, two months afterwards, the wound was healed except at its most dependent portion, from which there was a discharge of laudable pus. The conformation of the foot was well preserved and bore but little evidence that so large a portion of its bony structure had been removed. The following extract from a note concerning the case, and received from Assistant Surgeon T. D. Washburn, 126th Illinois—in charge of one of the wards of the hospital—described the appearance of the foot about that time (June 1st): 'The patient was not in my ward, but as this was an unusual operation I visited him the more frequently to witness its progress. The parts healed kindly and by June 1st were almost completely closed, and no one would have imagined that so formidable an operation had taken place. The appearance of the foot was natural, a new formation having apparently taken the place of the removed bone, leaving the configuration good; besides, he had some motion of the ankle, and it certainly promised to make a very useful as well as ornamental member of the body corporate.' I regret that I had no opportunity of seeing the case at a later date, to ascertain the amount of mobility of the joint retained or the character of the 'new formation,' whether fibrous, osteoid, or osseous. I had hoped by preserving a portion of the periosteum to secure a re-formation—in part at least—of the bony structure, and I have but little doubt, judging from the amount of reparative effort evinced by the ossific formation found in portions of the thickened periosteum, that such a result was actually obtained. The case presents several points of practical and pathological interest. There can be no doubt that the success of the operation was to some extent dependent on the small amount of interference with the circulation of the part, as already stated, not a single vessel requiring ligation. The granulations by which the cavity of the wound was filled presented a striking resemblance to the medulla of young bone. To what extent was the preserved periosteum concerned in the new formation and what was its ultimate character? The thickening proliferation of the periosteum was by far the greatest in the vicinity of the larger vessels, and the osseous spiculæ were most abundant in the same vicinity. The ossific deposits or formation in several places extended some distance into the adjacent soft parts and were sufficiently abundant to produce a grating sensation under the knife. Without entering upon a discussion of the method or methods of the 'pathological new formation of bone,' I will merely add that it does not seem unreasonable to suppose that the 'new formation' in this case was of an ossific character, and that the success attending the case is a strong argument in favor of 'conservative surgery.' In similar cases I should certainly look upon excision as the rational treatment, and amputation as the dernier resort."

FIG. 340.—Excision of os calcis and astragalus. [From a photograph taken 18 years after the operation.]

Various examining surgeons have from time to time certified to the injury and to the disability resulting therefrom. The photograph, represented in the adjacent wood-cut (FIG. 340), was contributed by the pensioner in May, 1881. He states that "the os calcis and astragalus were both removed, which makes the limb two and a half inches shorter. The articulations are now with the tibia, about two inches above the joint."

CASE 858.—Private R. Fuller, Co. I, 45th Illinois, aged 19 years, was wounded during the siege of Vicksburg, June 20, 1863. Surgeon G. R. Weeks, U. S. V., recorded his admission to the Seventeenth Corps hospital with "shot wound of left ankle." Six weeks after the reception of the injury the wounded man was transferred to Jefferson Barracks Hospital, whence Surgeon J. F. Randolph, U. S. A., reported that "gangrene appeared on August 16th, and was treated by application of nitric acid with favorable result," also that "resection of the external malleolus" was performed. The patient was discharged from service April 3, 1864, and pensioned. In the following month Examining Surgeon C. Hershe, of Muscatine, Iowa, certified to the injury involving the loss of the external malleolus, causing anchylosis of the ankle joint and leaving the leg "so painful that he cannot put the foot on the ground without enduring pain." The pensioner subsequently re-enlisted in the army and was assigned to the 42d Infantry, from which organization he was discharged March 31, 1869, when he again resumed his place on the Pension Rolls. Examining Surgeon F. Hooper, of Fall River, certified, November 13, 1869: "The external malleolus is gone, and the astragalus and os calcis are anchylosed to the tibia. A large cicatrix covers the outside of the ankle. There is some motion between the scaphoid and astragalus, but it produces pain in walking." In September, 1877, the Cleveland Examining Board reported "partial lateral displacement of foot outward, with anchylosis of ankle joint and deformity of foot," etc. The pensioner was paid June 4, 1880. The photograph from which the wood-cut (FIG. 341) is copied was furnished by the pensioner in 1881.[1]

FIG. 341.—View of left ankle 18 years after excision of external malleolus. [From a photograph.]

[1] CULBERTSON (H.), *Excision of the Larger Joints of the Extremities*, in *Trans. Am. Med. Association*, 1876, Supplement to Vol. XXVII, p. 314

Four cases of secondary excisions at the ankle joint proved fatal—one from pyæmia, one from gangrene, and two from exhaustion.

CASE 859.—Private T. Lister, Co. B, 26th Michigan, aged 26 years, was wounded at Spottsylvania, May 12, 1864. Surgeon J. E. Pomfret, 7th New York Artillery, reported his admission to the field hospital of the 1st division, Second Corps, with "wound of foot caused by a musket ball." Surgeon R. B. Bontecou, U. S. V., who operated in the case, described the injury as a gunshot wound of the left leg, lower third, the missile fracturing the tibia, entering about one inch above the ankle joint, and lodging in the head of the astragalus. The wounded man was admitted to Harewood Hospital, Washington, May 26th. On July 5th sulphuric ether was administered, and the lower end of the tibia as well as the head of the astragalus, which had become necrosed, were excised. The constitutional state of the patient at the time of the operation was very poor; the tissues had become infiltrated with pus. Five days after the operation the fibula protruded and was somewhat necrosed, the parts otherwise progressing favorably. The treatment was supporting. The result was unfavorable. Death occurred on August 7, 1864.[1]

CASE 860.—Private A. B. McCool, Co. E, 188th Pennsylvania, aged 21 years, was wounded in both lower extremities, at Cold Harbor, June 3, 1864. Surgeon S. A. Richardson, 13th New Hampshire, recorded his entrance into the Eighteenth Corps field hospital. Secondary resection was subsequently performed at Harewood Hospital, Washington, by Surgeon R. B. Bontecou, U. S. V., who reported that "the patient was admitted June 15th, suffering from gunshot wound of the right thigh and of the left leg at the ankle joint, fracturing the external and internal malleolus. At the time of admission the condition of the injured parts was not good, being œdematous and somewhat infiltrated with pus. Subsequently the parts sloughed extensively and the bone became necrosed, the patient's strength failing day by day. On July 12th sulphuric ether was administered and the ankle joint was resected, one inch each of the lower end of the tibia and fibula being removed. A severe and prostrating diarrhœa complicated the case, from the consequent exhaustion of which, together with the excessive suppuration, the patient died July 21, 1864. The treatment consisted of stimulants, sedatives, narcotics, and supporting diet." The excised portions of the tibia and fibula were contributed to the Museum by the operator and constitute specimen 3045 of the *Surgical Section*.[2]

CASE 861.—Private *J. T. McGuiffin*, Co. B, 24th Regiment (Confederate), aged 23 years, received a gunshot wound of the right ankle joint, at Drury's Bluff, May 16, 1864. The missile, a minié ball, entered in front and on a line with the internal malleolus, passed through the astragalus, and made its exit through the external malleolus, carrying with it a number of fragments. The injury was followed by the escape of synovia. There was also another wound of the right foot, fracturing the fourth metatarsal bone. Some days after the reception of the wounds the patient came under the care of Surgeon J. M. Holloway, P. A. C. S., who thought that amputation of the limb, though advisable as a primary operation, was not then admissible. Smith's anterior splint was applied and cold irrigation. Subsequently poultices, cerate dressings, and bandaging was used. Several abscesses formed and numbers of small fragments of bone were removed on different days. Anodynes, stimulants, and nutritious diet were administered as required. After consultation Dr. Holloway excised the ankle joint by Hancock's method, on June 21st, completing the operation without injury to nerve, vein, artery, or tendon. The patient was not removed from the operating table to his bed until the following day. By the second day the wounds had become unhealthy and gangrene of the toes was in progress. The patient died suddenly and unexpectedly on the morning of June 25, 1864, after his condition had encouraged the hope that in a few days it would be favorable for amputation of the limb.[3]

CASE 862.—Private J. C. Perkins, Co. B, 81st New York, aged 27 years, was wounded at Cold Harbor, June 3, 1864. Surgeon W. H. Rice, 81st New York, reported his admission to the field hospital of the 1st division, Eighteenth Corps, with "wound of ankles by a minié ball." Twelve days after the reception of the injury the wounded man was admitted to Harewood Hospital, Washington, where both limbs were operated upon by Surgeon R. B. Bontecou, U. S. V., who made the following report: "The patient was suffering from wounds of the right and left ankle joints, the ball entering above the external malleolus of the right ankle, passing directly through, and entering the internal malleolus of the left ankle. On admission and at the time of the operation the condition of the injured parts was not good. The wounds suppurated freely. There were detached portions of bone in each joint, and necrosed fragments came away from time to time. The constitutional state of the patient was poor. Resection of the right ankle joint and circular amputation of the left leg at the lower third was performed on July 7th, the anæsthetic consisting of sulphuric ether and chloroform. The result of the operation was unfavorable. The stump sloughed and profuse unhealthy suppuration followed the resection, extending in every direction and burrowing up the leg nearly to its middle. The patient became very weak and sank gradually. He died of exhaustion July 17, 1864. The treatment was tonic and supporting throughout." The tarsal bones of the right foot, together with the lower extremity of the tibia, were contributed to the Museum by Surgeon Bontecou and constitute specimen 3035 of the *Surgical Section*.

Excisions at the Ankle Joint, Time between the Injury and Operation unknown.—The five cases of this group would appear to have terminated in recovery, but it has been impracticable to get accurate details of the cases. Two of the operations were performed on Confederate and three on Union soldiers; the names of the latter do not appear on the Pension Rolls. The right ankle joint was excised in two, the left in one instance; in two cases the side was not indicated:

CASE 863.—Private T. Haley, Co. D, 91st New York, was wounded at Port Hudson, May 27, 1863. Surgeon T. B. Reed, U. S. V., reported his admission to a Nineteenth Corps field hospital with "wound of foot." Two days after the recep-

M.), *Comparative advantages of* PIROGOFF'S, SYME'S, *and* CHOPART'S *Amputations, and Excision of the Ankle Joint by* HANCOCK'S *Method, after Gunshot Wounds and other Injuries; with Reports of Cases and the Results; and proposing another Method for Excision of the Ankle Joint*, in *American Journal Medical Science*, 1866, Volume LI, p. 90.

tion of the injury the wounded man was transferred to University Hospital, New Orleans, where Assistant Surgeon P. S. Conner, U. S. A., recorded: "Gunshot wound of right foot; resection of astragalus. Patient absent without leave from September 7, 1863." There is no record of this man ever having applied for pension.

CASE 864.—Surgeon E. Andrews, 1st Illinois Artillery, publishes that "J. K——, 40th Illinois," in one of the Western campaigns received a compound shot fracture of the os calcis and astragalus, and that both these bones were excised, the operation being followed by recovery.

CASE 865.—Colonel *Y. M. Moody*, 43d Alabama, received a gunshot wound through the right ankle joint on June 16, 1864. He entered Confederate hospital No. 4, at Richmond, whence he was furloughed August 11, 1864. Excision of the lower end of the fibula was performed; the date of the operation was not recorded. The record of the case was found on the Confederate hospital registers.

CASE 866.—Private H. Gregory, Co. B, 35th U. S. Colored Troops, aged 18 years, was wounded at Olustee, February 20, 1864. He passed through various hospitals at Beaufort, one of which was under charge of Surgeon J. Trenor, jr., U. S. V., who reported the patient's admission, August 27th, with "gunshot wound of left ankle; astragalus excised before admission." Assistant Surgeon J. G. Murphy, U. S. V., reported that the patient was discharged from service June 5, 1865, by reason of "anchylosis of ankle joint" resulting from the wound. There is no record of this man ever having applied for pension.

CASE 867.—"Sergeant *P. R. Wright*, Co. K, 13th North Carolina, was wounded in the engagement near Williamsburg, May 5, 1862. A conical pistol ball entered on the outside of the os calcis near the sole of the foot, and passed up through the outer portion of this bone and through the astragalus, comminuting the lower end of the fibula and lodging between the tibia and fibula, three inches from their lower extremities. The missile was traced to its lodgement with difficulty. A crescentic incision along the course of the peroneus longus and behind the external malleolus was intersected by a straight incision coming up from the heel, and another crescentic incision was found necessary to be made anterior to the external malleolus. By working under the ligaments the loose fragments of bone were removed from the calcaneum and astragalus; the lower comminuted end of the fibula was cut and pulled away by means of the forceps, and the bullet was found in its lodgement between the two bones, about three inches from the joint. While the lateral ligaments were left in position with their superficial connections, their bony attachments were of course disturbed. The granulation and consolidation, which will probably result, must give the joint greater strength against inversion of the foot than it could acquire without them. The opening into the joint was made very free by this operation, which is an advantage. It is now well enough settled that an inflamed and suppurating joint is more likely to result well with a free and external opening than with a limited one." The case was reported by Surgeon D. Prince, U. S. V.; the result was not ascertained.

AMPUTATIONS AT THE ANKLE JOINT.—The number of exarticulations at the ankle recorded during the American civil war is one hundred and sixty-one; one hundred and three were primary, thirty-nine intermediary, and thirteen secondary operations; in six instances the time between the injury and the operation was not indicated.

TABLE LXXXIX.

Numerical Table of One Hundred and Sixty-one Amputations at the Ankle Joint for Shot Injury.

OPERATIONS.	Cases.	Recovery.	Death.	Undetermined.	Ratio of Mortality.	METHOD OF OPERATION.										
						PIROGOFF'S.			SYME'S.				VARIOUS METHODS.			
						Cases.	Recovery.	Death.	Cases.	Recovery.	Death	Undeterm'd.	Cases.	Recovery.	Death.	Undeterm'd.
Primary Operations	103	78	23	2	22.7	26	20	6	57	42	14	1	20	16	3	1
Intermediary Operations	39	25	14	.....	35.9	18	10	8	19	13	6	.....	2	2	.....	.....
Secondary Operations	13	12	1	.....	7.7	4	4	.....	7	6	1	.....	2	2	.....	.....
Period of Operation not specified	6	4	2	.....	33.3	1	1	.....	.....	.....	.....	.....	5	3	2	.....
Aggregates	161	119	40	2	25.1	49	35	14	83	61	21	1	29	23	5	1
						Mortality 28.5 %.			Mortality 25.6 %.				Mortality 17.8 %.			

The results were ascertained in one hundred and fifty-nine instances; one hundred and nineteen had successful, and forty fatal terminations, a mortality rate of 25.1 per cent., or 7.8 per cent. less than the death ratio after amputation in the leg.

Primary Amputations at the Ankle Joint.—In one instance both feet were removed. The one hundred and three operations were therefore performed on one hundred and two

patients; seventy-eight recovered, twenty-three died, and in two cases the results were not ascertained.

Successful Primary Amputations at the Ankle Joint.—Seventy-eight operations performed on seventy-seven patients belong to this group; sixteen were Confederate and sixty-one Union soldiers; the names of the latter were all on the Pension Roll; but six have died since the close of the war in 1865—two of diarrhœa and dysentery, one of apoplexy; in three cases the immediate cause of death is not reported.

CASE 868.—Private O. Leblanc, Co. E, 2d New Hampshire, aged 20 years, was wounded in the right foot, at Cold Harbor, June 1, 1864, by a shell, which fractured the tarsal and metatarsal bones. Assistant Surgeon J. C. McKee, U. S. A., reported that the man was admitted to Lincoln Hospital, Washington, ten days after receiving the injury, also that the wounded foot had been removed by Pirogoff's method, on the field, by Surgeon J. M. Merrow, 2d New Hampshire. The patient subsequently passed through various hospitals, and was ultimately discharged from service June 16, 1865, and pensioned, having been previously fitted with a "Palmer" artificial foot. The cast (*Spec.* 3732), contributed by Acting Assistant Surgeon L. C. Dodge and represented in the adjoining cut (FIG. 342), shows an apparently firm cicatrix, but reveals the stump to be a little irregular and without the appearance of being able to sustain decided weight. The pensioner was paid December 4, 1880.[1]

FIG. 342.—Stump after PIROGOFF'S amputation at left ankle joint. *Spec.* 3732.

CASE 869.—Private J. E. Ayers, Co. E, 8th New York Cavalry, aged 19 years, was wounded in the left foot, at Funkstown, July 10, 1863, and entered the General Hospital at Frederick eight days afterwards. Assistant Surgeon R. F. Weir, U. S. A., reported: "The injury consisted of a compound fracture of the tarsus. Syme's amputation at the ankle joint was performed on the field. During the progress of the case sloughing opened the stump, for which nitric acid wash was applied by injecting. Adhesive straps were used to support the posterior flap, and tonics were given internally; generous diet was allowed. The patient recovered with an excellent stump, and was discharged from service October 5, 1863." After leaving the service he became a pensioner, and subsequently he was an employé in the Quartermaster General's Office, U. S. A., for a number of years. In 1879 he received an appointment in the U. S. Treasury Department. On July 8, 1868, when visiting the Army Medical Museum, the pensioner walked remarkably well on an apparatus furnished by Dr. E. D. Hudson, of New York City, and the stump was found to be in good condition. Since then the pensioner has contracted and suffered for a time from frost bite in the stump, but in 1881 the stump was in excellent condition. The Army Medical Museum possesses a cast of the stump (*Spec.* 6056), represented in FIG. 343. A copy of a photograph of the pensioner, taken in January, 1881, is shown in FIGURE II of PLATE LXXV,[2] on the opposite page.

FIG. 343.—Stump after Syme's amputation at ankle. [From a cast.]

CASE 870.—Private H. W. Clark, Co. H, 100th New York, aged 30 years, was wounded by a shell in both feet, at Drury's Bluff, May 13, 1864. He was admitted to a Tenth Corps field hospital, where the injured limbs were removed. Assistant Surgeon E. McClellan, U. S. A., reported that the wounded man was brought to hospital at Fort Monroe six days after the injury, and that "both feet were amputated" before his admission. About two months afterwards the patient was transferred to McDougall Hospital, and subsequently to Central Park Hospital, New York City. Surgeon B. A. Clements, U. S. A., in charge of the latter, reported that "the right foot was shattered up to the metatarsal articulation, and the left heel with most of the tendo-achillis was carried away. There was no great amount of hæmorrhage. The amputations were performed on the field, while the man was under the influence of chloroform, by Surgeon M. S. Kittinger, 100th New York, the right foot being taken off by Chopart's method. His general condition at the time of the operation was good. At first sutures, bandages, and cold-water dressings were applied, and when the patient arrived at Fort Monroe, adhesive strips and bandages were used. Both stumps healed kindly, the right one in eight weeks and the left one in six weeks. At the time of his admission here, on July 26th, both were entirely well, the tendo-achillis of the right stump being considerably contracted." The patient was discharged from service December 13, 1864, and pensioned, and subsequently he was supplied with artificial feet by Dr. E. D. Hudson of New York City. Plaster casts of the stumps of the legs, contributed by Assistant Surgeon J. W. S. Gouley, U. S. A., constitute specimen 2857 of the *Surgical Section* of the Museum. That of the left limb, showing an excellent Syme's stump, is represented in the annexed wood-cut (FIG. 344). In his first application for commutation, in August, 1870, the pensioner described the stumps as being "sound and healthy;" but later, in 1880, he reported their condition as "poorly." His pension was paid December 4, 1880.[3]

FIG. 344.—Stump after SYME'S amputation at ankle joint. *Spec.* 2857. [From a cast.]

CASE 871.—Private A. K. Russell, Co. H, 1st Massachusetts Heavy Artillery, aged 43 years, was wounded at Spottsylvania, May 19, 1864, and admitted to Emory Hospital, Washington, three days afterwards. Acting Assistant Surgeon J. E. Janvrin reported: "Gunshot wound of left foot, the ball entering the heel posteriorly, passing forward through the os calcis and astragalus, and making its exit anteriorly on the dorsal surface of the foot. The os calcis and astragalus together with the metatarsal bones were comminuted, and, according to the patient's statement, the soft parts were very much lacerated. Chloroform was administered, and Syme's operation was performed on the day of the injury. When admitted to Emory Hospital the sutures had given way and the flap was pendant, with unhealthy discharges and tendency to slough. Adhesive straps and

cold-water dressings were applied, and subsequently linseed, charcoal, and yeast poultices were used. Alteratives, tonics, and stimulants were administered, the patient being much exhausted and suffering from loss of appetite, with derangement of the system generally. On June 3d the parts were thoroughly cleansed, and a flat padded splint was applied to the anterior surface of the leg, extending beyond the stump, after which adhesive straps were passed from beneath the leg across the flap and carried over the end of the splint and fastened. These were gradually shortened as the healing process went on, thus removing the tension and weight of the flap from the anterior edge of the wound. By July 12th the patient was doing well and the granulations were covering the bone. About August 18th the stump had nearly closed and the patient's general health was good Two weeks afterwards he left for his home on furlough. The success attending this case is attributed in a large measure to the method adopted for supporting the flap." The patient subsequently entered the general hospital at Readville, whence he was discharged from service June 2, 1865, and pensioned. After leaving the service he was furnished with an artificial foot. A photograph of the stump, taken three months after the date of the amputation, and contributed by Surgeon N. R. Mosely, U. S. V., is represented in FIGURE 4 of PLATE LXXV, opposite page 596. The man subsequently underwent a second operation, which was certified to by the Surgeon General of the State of Massachusetts, who communicated the following on January 26, 1871: "The pensioner has sustained re-amputation six inches below the knee, which was performed by Dr. C. N. Chamberlain, of Lawrence, late surgeon U. S. V., assisted by Dr. G. W. Garland, the case being at the time under my observation." In his subsequent application for commutation the pensioner described the stump as being in a good condition. His pension was paid December 4, 1880.

CASE 872.—Private E. R. Covell, Co. C, 52d New York, aged 38 years, was wounded in the left foot, at Spottsylvania, May 18, 1864, and admitted to the field hospital of the 1st division, Second Corps. Surgeon J. W. Wishart, 140th Pennsylvania, described the injury as a "shell wound of the tarsal and metatarsal bones," for which he performed "Syme's amputation at the ankle joint." Ten days after being wounded the patient entered Emory Hospital at Washington, and subsequently he was transferred to Central Park Hospital, New York City. Surgeon B. A. Clements, U. S. A., in charge of the latter, reported the following history of the case: "Considerable hæmorrhage took place at the time of the injury, and the man's general condition was not very good in consequence of his suffering from diarrhœa. Amputation at the ankle joint was performed under chloroform six hours after the reception of the injury, the ends of the tibia and fibula also being removed. Sutures, adhesive strips, and cold water dressings were applied. The parts did not unite by first intention, though there was no sloughing nor necrosis. When the patient was admitted to Central Park Hospital, August 17th, the stump had healed with the exception of a small ulcer in the cicatrix near the external angle of the flaps, and his general condition was pretty good, though he still had diarrhœa. By October 2d the stump was entirely healed and the diarrhœa was much improved." The patient was discharged from service November 3, 1864, and pensioned, having been previously furnished with an artificial foot. A cast of the stump (*Spec.* 4369) was contributed to the Museum by Surgeon J. J. Milhau, U. S. A., and is represented in the adjoining wood-cut (FIG. 345). After leaving the service the stump was re-amputated at the lower third of the leg on May 5, 1869. In his subsequent applications for commutation the pensioner described the condition of the stump as "sound and healthy." His pension was paid September 4, 1881.[1]

FIG. 345.—Stump after SYME'S amputation at ankle joint. *Spec.* 4369. [From a cast.]

CASE 873.—Lieutenant W. C. Weeks,[2] Co. I, 5th Michigan Cavalry, aged 28 years, was wounded at Five Forks, April 1, 1865, by a conoidal musket ball, which passed through the left ankle joint. Assistant Surgeon C. A. Leale, U. S. V., reported: "He was immediately conveyed to hospital at City Point, where Surgeon A. K. St. Clair, 5th Michigan Cavalry, performed Pirogoff's amputation at the ankle joint the same day, removing the articulating surfaces of the tibia and calcaneum and bringing the cut extremities into apposition. On April 16th the patient was transferred to Armory Square Hospital at Washington, where he was admitted in a very feeble condition. Erysipelatous inflammation extended from the stump several inches above the knee joint. Extensive suppuration had taken place, and, although fifteen days had elapsed since the operation, the rough edges of the calcaneum could be rubbed against the denuded end of the tibia, proving that no union existed. The integumentary flap had partially united, thus confining a large quantity of pus in the stump, which prevented the bones from being kept in apposition. Metastatic abscesses had commenced to form along the course of the anterior tibial lymphatic glands, and every symptom prognosticated an unfavorable termination, the only hope being based on the remarkable strong constitution of the patient. The abscess at the stump was freely evacuated, and the metastatic abscesses were freely opened as soon as fluctuation could be detected; the calcaneum and tibia were held in proper position by means of adhesive straps after the limb had been thoroughly cleansed with liquor of chloride of zinc. Large linseed poultices were applied over the lower third of the tibia and lead and opium wash over the remaining part of the limb as far as the erysipelas extended; stimulants and beef tea were administered. The patient gradually improved until April 28th, when he had a chill, which was soon followed by others. Quinine and tincture of chloride of iron was then prescribed and an ounce of brandy was given every two hours. By May 2d the patient had the peculiar sweet odor of breath and the well-marked icteroid hue, especially in the conjunctivæ, which were exceedingly yellow. Several chills occurred each day and were followed by considerable febrile movement and great prostration; but by the frequent administration of stimulants and the constant application of artificial heat the patient rallied, after which beef tea was given in quantities as large as could be tolerated. From May 6th he improved, the chills occurring at longer intervals and with less severity until May 12th, when they ceased. A slight diarrhœa at this time was checked by starch and opium injections, after which the patient convalesced rapidly. By June 26th he had entirely recovered, the os calcis having united to the tibia and the wound having closed, leaving a solid, firm stump." A plaster cast of the stump, Specimen 2298 of

FIG. 346.—Stump after PIROGOFF'S amputation at ankle joint. [From a plaster cast.]

[1] SMITH (S.), *Amputations at the Ankle Joint in Military Surgery*, in *U. S. San. Com. Memoirs*, New York, 1871, Surgical Volume II, p. 136.

[2] *Circular* No. 6, War Department, S. G. O., 1865, p. 47. SMITH (S.), *Amputations at the Ankle Joint in Military Surgery*, in *U. S. Sanitary Commission Memoirs*, New York, 1871, Surgical Volume II, pp. 116, 132.

the Army Medical Museum, is shown in FIG. 346, and a photograph of the patient is copied in FIGURE I of PLATE LXXV, opposite page 596. Lieutenant Weeks was mustered out of service July 20, 1865, and pensioned, after which time he commenced to wear the "Palmer" artificial foot. In a subsequent report, dated June 28, 1866, Dr. Leale furnished the following information in regard to the case: "I have just received a communication from Lieutenant Weeks (residing at Allegan, Michigan), in which he states: 'I am able to do anything that most men can do; my patent foot works like a charm. I am at present engaged in a large flour mill, and my stump has never troubled me but once since I left the hospital, and then it was caused by an accident, which loosened a small splinter of bone. This I had removed at Chicago, since which time it has done well. I adjusted my false foot on October 1, 1865, and never take it off except when I go to sleep. I can easily walk without a cane.'" The pensioner was paid September 4, 1881.

CASE 874.—Private H. Bell, Co. A, 2d New York Artillery, aged 45 years, was wounded in the left foot, at the battle of White Oak Swamp, June 30, 1862. He was conveyed to hospital at Fort Monroe, whence he was transferred to DeCamp Hospital, David's Island, three weeks afterwards. Surgeon J. Simons, U. S. A., in charge of the latter, recorded the patient's admission with "amputation of foot." Assistant Surgeon J. W. S. Gouley, U. S. A., in charge of Central Park Hospital, New York City, contributed the cast (*Spec.* 4218), represented in the annexed wood-cut (FIG. 347), with the following description: "This interesting wax specimen, a cast of Pirogoff's operation, I regret to say has an incomplete history. According to the patient's statement he was wounded by a shell, which tore off the outside of the foot nearly up to the ankle. He was etherized on the field, and when he awoke he found that he had no foot. When admitted to this hospital, on October 28th, the stump was healed and in the condition represented in the cast. The parts were perfectly consolidated, and the heel was firm and capable of sustaining the weight of his whole body without giving rise to pain or tenderness. The limb was about three-fourths of an inch shorter than its fellow. The patient was furnished with an apparatus by Dr. Hudson, which answered admirably, the heel of the artificial limb being made three-fourths of an inch higher, while the ankle joint was lowered. On the whole it was as shapely as the width of the ankle would allow. The patient was discharged from service July 7, 1863. Before he left the hospital he was able to walk without the assistance of a cane and without causing any irritation to the stump." Examining Surgeon W. M. Chamberlain, of New York City, certified to "loss of most of the left foot. Pirogoff's operation has been successfully performed. A small fragment of the heel only is left, and the pensioner wears an artificial foot." The pensioner was paid March 4, 1871, since when he has not been heard from.[1]

FIG. 347.—Stump of left leg after PIROGOFF'S amputation at ankle joint. [From a cast.]

CASE 875.—Captain J. F. Denniston, Commissary of Subsistence, U. S. V., aged 24 years, was wounded in the right foot, during the engagement at the Weldon Railroad, August 25, 1864. Surgeon N. Hayward, 20th Massachusetts, reported his admission to the field hospital of the 2d division, Second Corps, with "fracture of ankle," followed by "Pirogoff's operation, performed by Surgeon G. Chaddock, 7th Michigan." Surgeon D. W. Bliss, U. S. V., who subsequently re-amputated the limb, reported that "the patient entered Armory Square Hospital, Washington, August 28th. On September 6th hæmorrhage ensued, which was controlled by styptics and a compress, but commenced again two days afterwards, when the femoral was held by the attendants for several hours. On September 10th a fresh and copious hæmorrhage set in, when, after a thorough examination of the parts, it was deemed proper to amputate at a point about three inches above the ankle, the patient being in good condition at the time. The entire loss of blood probably amounted to a pint, its source being first the anterior tibial and afterwards the femoral artery. The amputation was performed by the circular method and without much shock to the patient's system. The treatment included tonics, stimulants, and nourishing diet. Simple dressings were used. Three weeks after the operation the patient was doing well." The re-amputated stump, showing the soft tissues and the cut surfaces of the tibia and os calcis softened by suppuration, was forwarded to the Museum by the operator and constitutes specimen 3211 of the *Surgical Section*. In 1881 the soft tissues were removed from the specimen, when it was found that the tibia was fissured to the extent of four inches (FIG. 348). The patient was subsequently transferred to the Seminary Hospital, Georgetown, where he obtained leave of absence November 25th, when he started for his home. He was ultimately mustered out of service January 1, 1867, and pensioned. While serving as an officer of the 70th New York, at the battle of Williamsburg, May 5, 1862, Captain Denniston had also been wounded in the right forearm, for which injury he underwent the operation of resection of the continuity of the bones.[2] After leaving the service he obtained an artificial leg from the Pittsburgh Artificial Limb Manufacturing Co., and since then he has continued to report the stump of his amputated leg as being in a "healthy condition." The pensioner was paid September 4, 1881.

FIG. 348.—Bones of the right ankle joint after PIROGOFF'S amputation. *Spec.* 3211.

Fatal Primary Amputations at the Ankle Joint—The results in twenty-three primary amputations at the ankle joint were fatal. Syme's operation was performed in fourteen, and Pirogoff's in six instances; in three the mode of operation was not indicated. Seventeen of the patients were Union and six Confederate soldiers. In four instances the exarticulations at the joint were followed by amputations in the leg:

CASE 876.—Private H. E. Boynton, Co. L, 1st Massachusetts Heavy Artillery, aged 18 years, received a shot fracture of the left foot and of the right arm, at Spottsylvania, May 19, 1864, and was admitted to the field hospital of the 1st division, Second Corps. Surgeon J. W. Wishart, 140th Pennsylvania, reported that he amputated the foot by Syme's method on the day of the injury. Three days afterwards the wounded man entered Emory Hospital at Washington, where Surgeon N. R. Moseley,

[1] SMITH (S.), *Amputations at the Ankle Joint in Military Surgery*, in *U. S. San. Com. Memoirs*, New York, 1871, Surgical Vol. II, pp. 117, 134.

[2] See *Medical and Surgical History of the War of the Rebellion*, Part II, Volume II, TABLE CXXVIII, p. 957, No. 23.

U. S. V., excised two inches of the middle third of the fractured humerus. The case resulted fatally on June 22, 1864. The excised portion of the humerus (*Spec.* 2322) and most of the bone of the amputated foot (*Spec.* 828) have been contributed to the Museum by the respective operators. The latter specimen consists of the metatarsus, scaphoid, cuboid, and outer two cuneiform bones, and shows a large, battered, conoidal bullet occupying the place of the inner cuneiform, the bones adjacent to it being fractured.

CASE 877.—Private E. P. Hale, Co. I, 1st Minnesota, aged 24 years, was wounded through the left lung and in the left foot, at Gettysburg, July 2, 1863. He was admitted to the field hospital of the 1st division, Second Corps, where amputation was performed by Surgeon C. S. Wood, 66th New York, who described the injury of the foot as follows: "A minié ball entered at the internal malleolus, passed obliquely downward and outward, and emerged about two inches below the external malleolus, comminuting the astragalus and involving the ankle joint. Syme's operation was performed." Five weeks after the reception of the injuries the patient was transferred to Camp Letterman, whence Acting Assistant Surgeon A. B. Shekell reported that the wounds discharged freely and that the patient continued in a weak state, his condition and the stump of the leg improving but slightly, though stimulants, quinine, and iron were freely administered. Simple dressings were applied. On September 2d an abscess was opened on the inner side of the right thigh, which discharged about a pint of pus. The case terminated fatally on September 12, 1863. The lower extremities of the bones of the stump (*Spec.* 1949), showing the articular surfaces to be destroyed by ulceration, were contributed to the Museum.

CASE 878.—Private G. Harfeter, Co. D, 104th Pennsylvania, aged 22 years, was wounded at Morris Island, September 27, 1863, and was conveyed to hospital No. 5, at Beaufort, the following day. Assistant Surgeon J. S. Smith, U. S. A., reported: "The wound was by a fragment of shell in the left foot, which was amputated the next day by Surgeon R. B. Bontecou, U. S. V., on board of the hospital transport Cosmopolitan. Syme's operation was performed. There was also a slight flesh wound of the right hip and right arm. Simple dressings were used and anodynes were given at night. On October 1st slight hæmorrhage occurred, which was easily controlled by slight pressure, about an ounce of blood being lost. Two days afterwards a profuse hæmorrhage took place, reducing the patient's vitality to an alarming extent. The stump was then opened for the purpose of securing the bleeding vessel, but it could not be found, and the anterior tibial was ligated two inches above the seat of the hæmorrhage. The bleeding did not recur, but the patient gradually sank. He died October 12, 1863."

CASE 879.—Private F. M. Bland, Co. D, 23d Iowa, aged 22 years, was wounded in the left foot during the engagement at the Black River, May 19, 1863, and entered Adams Hospital, Memphis, several weeks afterwards. Acting Assistant Surgeon B. J. Bristol reported: "Syme's operation at the ankle had been performed the same evening the injury was received. At the time of the patient's admission to Adams Hospital, June 13th, nearly the entire flap had sloughed off and the bones were exposed to view. An abscess had also formed at the middle of the lower third of the leg, and there was periostitis of the tibia and fibula at the same point. The general condition of the patient was low, he having had diarrhœa for four months. He was put upon iron, quinine, stimulants, and astringents. On June 17th his general condition was somewhat improved, the diarrhœa checked, and it was decided to operate. Amputation of the leg was accordingly performed at the junction of the middle and upper third by Acting Assistant Surgeon J. Thompson. I saw the patient for the first time the next day, when, though in a low condition, he seemed to be rallying from the shock of the operation. I administered tonics, stimulants, and beef tea freely, and had water dressings applied to the stump, under which course the general condition of the patient gradually improved. The stump then appeared to do well, but before many days it began to discharge a thin ichorous-looking pus. About June 26th the flaps gaped open, no adhesions having formed in any part of the stump. The flaps soon commenced sloughing, and it was decided that the only chance for the patient laid in another amputation. Accordingly on July 2d the thigh was taken off at the middle of the lower third, which operation the patient seemed to bear well. The tonic and supporting treatment was continued, and as before the patient seemed at first to be doing well; but the stump soon became gangrenous. An abscess also formed below the clavicle, the edges of which sloughed away, laying bare the thyroid axis, the branches of it too sloughing off. On July 13th the patient was removed to my ward in a rapidly sinking condition. He died three days afterwards—on July 16, 1863." The Syme stump (*Spec.* 1706), removed at the first re-amputation and contributed to the Museum by Surgeon J. G. Keenon, U. S. V., shows the extremities to be necrosed and an absence of reparative action.

TABLE XC.

Summary of One Hundred and Three Cases of Primary Amputation at the Ankle Joint for Shot Injury.

[Recoveries, 1—78; Deaths, 79—101; Results undetermined, 102–103.]

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	[1]Ayres, J. E., Pt., E, 8th N. York Cavalry, age 19.	July 10, 1863.	Conoidal ball comminuted left tarsus.	July 10, 1863.	Syme's amputat'n at left ankle joint.	Sloughing. Discharged October 5, 1863; pensioned. *Spec.* 6056, A. M. M. Stump in good condition in 1881.
2	Baal, M., Pt., E, 21st Iowa, age 20.	May 17, 1863.	Shot fracture of right foot.	May 17, 1863.	Pirogoff's amputation at right ankle joint.	Discharged Sept 26, 1863; pensioned. Stump perfectly healed.
3	Barnett, J. B., Pt., E, 19lst Pennsylvania, age 33.	Mar. 31, 1865.	Conoidal ball comminuted tarsal and metatarsal bones of left foot.	April 1, 1865.	Syme's amputation at left ankle joint. Surg. A. A. White, 8th Maryland.	April 8, amputation in low. third of leg. Discharged June 28, 1865, and pensioned.
4	[2]Bell, H., Pt., Battery A, 2d New York Artillery, age 45.	June 30, 1862.	Shell fracture of tarso-metatarsal bones of left foot.	June 30, 1862.	Pirogoff's amputation at left ankle joint; lower portion of tibia and anterior portion of calcaneum exscted.	Discharged July 7, 1863; stump finely formed; pensioned. Able to walk without aid of cane; portion of calcaneum useless. *Spec.* 4218, A. M. M.

5	Blake, H., Pt., I, 37th Mass., age 36.	June 13, 1864.	Shot fracture of right tarsus.	June 13, 1864.	Pirogoff's amputation at right ankle joint.	Discharged December 16, 1864; pensioned. Stump well healed.
6	Blakeman, M. A., Pt., D, 36th Ohio, age 36.	Sept. 22, 1864.	Conoidal ball fractured the right ankle joint.	Sept. 22, 1864.	Amputat'n at right ankle joint by Syme's method.	Discharged May 8, 1865, and pensioned. Stump perfectly healed.
7	*Blankenbecker, G. R.*, Pt., C, 4th Va. Cavalry, age 20.	June 24, 1864.	Conoidal ball fractured metatarsal bones of left foot.	June 24, 1864.	Syme's amputation at ankle joint.	Sloughing of flaps; abscesses. Furloughed October 30, 1864.
8	Bourkney, N., Pt., K, 155th New York, age 32.	June 16, 1864.	Shell fracture of right tarsus.	June 17, 1864.	Amputation at ankle joint by circular incision. Surgeon N. Hayward, 20th Mass.	Discharged March 15, 1865, and pensioned.
9	Brewster, J., Pt., I, 29th Conn. (colored), age 22.	Sept. 29, 1864.	Grapeshot wound of left foot, fracturing metatarsal bones.	Sept. 29, 1864.	Syme's amputation at ankle joint.	Discharged July 22, 1865, and pensioned. Sound stump.
10	Brink, S. S., Pt., B, 36th Wisconsin, age 28.	June 18, 1864.	Conoidal ball fractured left foot.	June 18, 1864.	Flap amputation at ankle joint. Surgeon N. Hayward, 20th Massachusetts.	Discharged April 25, 1865; pensioned. Stump unsound: bone diseased.
11	Bunting, J. R., Corp'l, I, 8th Michigan, age 28.	April 16, 1862.	Shot comminution of astragalus and calcaneum.	April 18, 1862.	Syme's amputation at left ankle joint. Ass't Surgeon C. A. McCall, U. S. A.	Discharged June 27, 1862; pensioned. Stump healthy and useful.
12	[1] Clark, H. W., Pt., H, 100th New York, age 30.	May 13, 1864.	Solid shot fractured bones of both feet.	May 13, 1864.	Syme's amputation at left ankle joint; Chopart's amputation right foot. Surg. M. S. Kittinger, 100th New York.	Discharged December 13, 1864. *Spec.* 2857, A. M. M.
13	*Collins, W.*, Pt., F, 3d Mississippi Battery, age 28.	July 22, 1864.	Conoidal ball fractured the arch of the left foot.	July 23, 1864.	Syme's amputation at ankle joint.	Recovered.
14	[2] Connors, J., Pt., F, 76th Pennsylvania, age 25.	July 11, 1863.	Musket ball comminuted the right tarsus.	July 12, 1863.	Syme's antero-post. flap amputation at right ankle joint.	Necrosis of tibia. Sept. 27, amp. lower third leg. Disch'd Aug. 28, 1865; pensioned.
15	[3] Covell, E. R., Pt., C, 52d New York, age 38.	May 18, 1864.	Shell wound, carrying away a large portion of left foot; considerable hæmorrhage.	May 18, 1864.	Syme's amput'n at ankle joint, end of tibia and fibula rem'd. Surgeon J. W. Wishart, 140th Pennsylvania.	Discharged Nov. 3, 1864; pensioned. May 5, 1869, amput'n lower third leg. *Spec.* 4369, A. M. M.
16	[4] Denniston, J. F., Commissary of Subsistence, U. S. V., age 24.	Aug. 25, 1864.	Conoidal ball fractur'd the right ankle.	Aug. 25, 1864.	Pirogoff's amputation at ankle joint.	Hæm. from ant. tib. and femoral arteries. Sept. 10, amp. lower third leg. Disch'd Jan. 1, 1867, and pensioned. *Spec.* 3211.
17	[5] Dresser, E. E., Pt., A, 20th Massachusetts, age 21.	June 24, 1864.	Shell fragm't extensively lacerated foot and injured tarsal and metatarsal bones.	June 24, 1864.	Syme's amp. at ankle. Surg. N. Hayward, 20th Mass. Soft parts so much destroyed that flaps were made from sides of ankle and foot and exter. sole.	Fragments of necrosed bone removed. Discharged Dec. 12, 1864. Died Nov. 14, 1870, from ulceration of bowels.
18	Dudley, E. H., Pt., K, 16th Vermont, age 20.	July 3, 1863.	Shell fracture and laceration of tarsal bones of left foot.	July 4, 1863.	Syme's amputation at ankle. Ass't Surgeon C. H. Richmond, 104th New York.	Inflammation; sloughing. July 18, amp. lower third leg. M. O. Aug. 10, 1863. Amp. up. third leg Dec. 21, 1863; pensioned.
19	[6] Duffy, T., Pt., I, 70th New York, age 21.	June 1, 1862.	Musket ball fractured tarsal and metatarsal bones of left foot.	June 2, 1862.	Syme's amputat'n at left ankle joint.	Sloughing of flaps. Nov. 6, amp. middle third leg. Nov. 28, sequestra removed. Disch'd July 11, 1863; pensioned. Healthy stump. *Spec.* 4312.
20	*Foreman, J. M.*, Pt., B, 7th Louisiana.	May 4, 1863.	Gunshot wound	May 5, 1863.	Amput'n at ankle joint. Surg. J. B. Davis, C. S. A.	Furloughed June 23, 1863.
21	Freeman, J. C., Pt., A, 9th New York, age 26.	Sept. 17, 1862.	Shot fracture of left foot	Sept. 18, 1862.	Syme's amp. at left ankle. Surg. G. C. Humphreys, 9th N. Y.	Discharged December 30, 1862; pensioned. Stump healed.
22, 23	Hicks, H. F., Pt., A, 1st R. Island Artillery.	Dec. 13, 1862.	Shot wound of both feet	Dec. 14, 1862.	Syme's amput'n at right ankle, and Pirogoff's at left ankle.	Discharged September 14, 1863; pensioned.
24	[7] *Holland, R. H.*, Corp'l B, 44th Virginia.	May 3, 1863.	Shot fracture of tarsus	May 4, 1863.	Pirogoff's amputation at ankle joint. Surg. B. F. Whitehead, C. S. A.	Recovery. 1864, unable to walk without crutches. Parts still swollen and œdematous; heel drawn upward.
25	*Holmes, A. W.*, Pt., K, 20th Georgia.	June 19, 1864.	Shot wound of right foot	June 19, 1864.	Amputat'n at right ankle joint. Surgeon C. Cord, C. S. A.	Discharged August 25, 1864.
26	Hosington, G., Pt., A, 123d Ohio, age 36.	June 13, 1863.	Wound of left foot by conoidal ball.	June 14, 1863.	Amputation at ankle joint by Confederate surgeon.	June 21, amp. leg 3 ins. above ankle joint. Sept. 17, re-amp. in middle third leg. Disch'd May 16, 1865; stump entirely healed; pensioned. Died Dec. 16, 1866.
27	*Humble, T.*, Pt., G, 24th Texas.	May 13, 1864.	Shot wound of right foot	May 13, 1864.	Amputat'n at right ankle joint. Surg. G. W. Lawrence, C.S.A.	Retired March 2, 1865.
28	Hunt, J., Pt., C, 19th Indiana, age 38.	June 18, 1864.	Conoidal ball injured right foot.	June 18, 1864.	Syme's amput'n at right ankle joint. Surgeon J. Ebersole, 19th Indiana.	Discharged May 20, 1865, and pens'd. Stump perfectly healed. Declares, in 1875, that his leg is slowly getting weaker.
29	Hunter, A., Pt., F, 140th Pennsylvania, age 33.	May 8, 1864.	Shell fracture of all metatarsal bones in right foot.	May 9, 1864.	Syme's flap amputation at right ankle joint. Surgeon J. W. Wishart, 140th Pennsylvania.	Discharged June 14, 1865; pensioned.
30	Isham, D. E., Pt., E, 154th New York, age 19.	May 3, 1863.	Shell wound, shattering and carrying away most of left foot.	May 4, 1863.	Chopart's amp. attempted, but finding astragalus and cuneiform injured, Syme's operat'n was performed. Surg. C. S. Wood, 66th New York.	Discharged January 22, 1864, and pensioned.
31	Jackson, F., Pt., E, 86th Colored Troops, age 32.	April 3, 1865.	Compound fracture right foot by fragment of shell.	April 3, 1865.	Syme's amput'n at right ankle joint. Surgeon H. Osborne, 51st Colored Troops.	Discharged Aug. 7, 1865. Stump perfectly healed.
32	[8] Johnson, F., Capt., K, 26th Michigan, age 22.	May 12, 1864.	Conoidal ball comminuted left tarsus.	May 12, 1864.	Syme's amputation, left ankle joint. Surg. J. W. Wishart, 140th Pennsylvania.	Discharged Nov. 30, 1864; pensioned. 3½ ins. shortening; flaps retracted. Not heard from since September 4, 1870.
33	Johnson, J. M., Pt., C, 3d Delaware, age 31.	June 3, 1864.	Shell wounds of left foot and right leg.	June 3, 1864.	Syme's amputation at left ankle joint; also amp. in mid. third right leg. Surg. G. W. Metcalf, 76th New York.	Discharged June 8, 1865; pensioned. Small ulcer on stump in 1874.

Surg. P. Gardner, 1st W. Va. Cav.	Discharged May 29, 1865; pensioned. An open ulcer extended to the rear of the ext. malleolus.
72	[1] Weeks, W. C., Lieut., I, 5th Michigan Cavalry, age 28.	April 1, 1865.	Conoidal ball perforated left ankle joint.	April 1, 1865.	Pirogoff's amput'n at left ankle joint. Surg. A. K. St. Clair, 5th Michigan Cavalry.	Discharged July 20, 1865. Good solid stump. 1866, small portion of bone removed. *Spec.* 2298.
73	Welsh, M., Pt., H, 47th New York, age 26.	Oct. 7, 1864.	Fracture of left ankle joint by conoidal ball.	Oct. 8, 1864.	Syme's amputat'n at left ankle joint.	Disch'd May 31, 1865; pensioned. Died Jan. 17, '76; chr. dysentery
74	Wilson, R., Pt., E, 72d Pennsylvania, age 22.	June 3, 1864.	Shell wound of left foot.....	June 3, 1864.	Disarticulat'n at left ankle joint. Surg. M. Rizer, 72d Penn.	Discharged May 5, 1865, and pensioned.
75	Wincel, P., Pt., B, 36th Wisconsin, age 22.	June 2, 1864.	Conoidal ball fractured bones of left foot.	June 3. 1864.	Antero-posterior flap amputat'n at left ankle joint.	Gangrene. Discharged October 7, 1864, and pensioned.
76	Winters, C. H., Corp'l, F, 110th Ohio, age 30.	May 12, 1864.	Wound of right foot by fragment of shell.	May 12, 1864.	Syme's amputation at right ankle joint.	Discharged December 14, 1864, and pensioned.
77	*Womack, J. K.*, Pt., H, 14th Virginia, age 21.	July 3, 1863.	Shot fracture of left foot.....	July 4, 1863.	Syme's amputat'n at left ankle joint.	Paroled Sept. 25, 1863. Stump sound and good.
78	*Yount, J. M.*, Pt., G, 52d Virginia.	June 8, 1862.	Shot wound.....	June 8, 1862.	Amputation at ankle joint by Surg. J. M. Hayes, C. S. A.	Recovered.
79	Birmingham, A., Lieut., A, 69th New York, age 20.	Dec. 13, 1862.	Wound of left foot by conoidal ball; also wound right thigh.	Dec. 13, 1862.	Pirogoff's amp. at left ankle j't; also amputat'n of right thigh.	Died December 17, 1862.
80	Bland, F. M., Pt., D, 23d Iowa, age 22.	May 19, 1863.	Shot fracture of left foot.....	May 19, 1863.	Syme's amput'n at ankle joint; sloughing. June 17, amp. leg at junc. upper thirds. July 2, amp. thigh, lower third.	Gangrene of thigh stump. Died July 16, 1863. *Spec.* 1706, A. M. M.
81	Boynton, H. E., Pt., L, 1st Mass. Artillery, age 18.	May 19, 1864.	Conoidal ball fractured left tarsal and metatarsal bones; also fracture of right humerus.	May 19, 1864.	Syme's amp. at left ankle joint. Surgeon J. W. Wishart, 140th Pennsylvania.	Two inches of middle third of humerus excised May 22d. Died June 22, 1864. *Spec.* 828, A.M.M.
82	Bradshaw, G., Pt., D, 19th Ohio.	Jan. 1, 1863.	Shot wound of left foot.	Jan. 1, 1863.	Pirogoff's amputation at left ankle joint.	Died February 4, 1863.
83	*Cecil, R.*, Lieut., K, 1st Virginia Cavalry.	May 24, 1864.	Shot wound of left tarsus.....	May 24, 1864.	Pirogoff's modificat'n of Syme's amputation at left ankle joint.	Sphacelus, necessitating intermediary amp. leg in upper third. Died June 22, 1864.
84	Colbert, E., Pt., K, 170th N. York, age 34.	May 23, 1864.	Conoidal ball fractured left foot.	May 25, 1864.	Pirogoff's amputation at left ankle joint. Surgeon M. F. Regan, 164th New York.	Died June 9, 1864, of tetanus.
85	Davis, J., Steamer Memphis.	Nov. 7, 1861.	Shot wound of right foot.....	Nov. 9, 1861.	Syme's amput'n at ankle joint.	Died February 26, 1862, of pneumonia.
86	Frank, A. B., Pt., L, 2d N. York Artillery, age 30.	June 16, 1864.	Conoidal ball fractured tarsal and metatarsal bones of right foot.	June 16, 1864.	Syme's amput'n at right ankle joint. Surg. J. W. Wishart, 140th Pennsylvania.	Sloughing of flaps. Died July 28, 1864.
87	Hale, E. P., Pt., I, 1st Minnesota, age 24.	July 2, 1863.	Conoid. ball entered at internal malleolus and emerged 2 ins. below ext. malleolus; astragalus comminuted.	July 2, 1863.	Syme's amputat'n at left ankle joint. Surgeon C. S. Wood, 66th New York.	Died September 12, 1863. *Spec.* 1949, A. M. M.
88	Harfeter, G., Pt., D, 104th Pennsylvania, age 22.	Sept. 27, 1863.	Shell wound of left foot; also slight wounds of hip and arm.	Sept. 28, 1863.	Syme's amputat'n at left ankle joint. Surg. R. B. Bontecou, U. S. V.	Oct. 1, 3, hæmorrhage; ligation of anterior tibial. Died October 12, 1863.
89	Lour, B. F., Pt., A, 140th Pennsylvania.	July 2, 1863.	Conoidal ball shattered bones of right foot.	July 2, 1863.	Syme's amput'n at right ankle joint. Surgeon C. S. Wood, 66th New York.	Died August 2, 1863.
90	Morgan, T., Pt., I, 29th Pennsylvania.	July 20, 1864.	Shell fracture of right foot	July 20, 1864.	Amputat'n at right ankle joint. Surg. J.V.Kendall, 149th N.Y.	Died September 11, 1864.
91	Oppelt, M., Pt., K, 36th Wisconsin, age 30.	June 6, 1864.	Conoidal ball fractured the right foot.	June 6, 1864.	Amputat'n at right ankle joint. Surg. S. H. Plumb, 59th N. Y.	Died July 11, 1864.
92	*Pope, J.*, Pt., C, 37th Mississippi, age 22.	Oct. 8, 1862.	Shot fracture of bones of right foot.	Oct. —, 1862.	Primary amput'n at right ankle joint by Syme's method.	Died Nov. 6, 1862, of pyæmia.
93	Porter, G. H., Pt., D, 3d Indiana Cavalry, age 31.	May 5, 1864.	Conoidal ball fractured the right foot.	May 5, 1864.	Syme's amput'n at right ankle joint.	May 17, amput'n lower third leg. Died June 4, 1864, of pyæmia.
94	Shoemaker, J., Pt., H, 57th Ohio, age 33.	Jan. 11, 1863.	Conoidal ball fractured tarsal bones of left foot.	Jan. 11, 1863.	Syme's amputat'n at left ankle joint. Surgeon J. B. Sparks, 19th Kentucky.	Jan. 31, amp. leg, lower third. March 8, re-amp. leg, mid. third. Died Mar. 19, '63; gang. of stump.
95	Smith, H., Pt., G, 12th Missouri.	Nov. 9, 1863.	Shot fracture of left foot.....	———	Primary amputation at ankle joint by Syme's method.	Died December 1, 1863.
96	*Smith*, —, —, E, 53d Georgia, age 27.	———	All the bones of left foot badly com'nuted by shell fragment.	On field.	Syme's amput'n at ankle joint. Surg. J. J. Knott, 53d Ga.	Re-amputation. Died.
97	Thurston, L., Pt., H, 2d N. York Heavy Artillery, age 25.	June 16, 1864.	Conoidal ball shattered the tarsal bones of left foot.	June 17, 1864.	Syme's amputat'n at left ankle joint. Surg. J. W. Wishart, 140th Pennsylvania.	Died June 28, 1864, of hospital gangrene.
98	[2] *Unknown*	———	Shot wound.....	On field	Pirogoff's amp. at ankle joint. Surg. J. T. Gilmore, C. S. A.	Also amputation of other leg by Lenoir's method. Died.
99	*Unknown (A. B.)*, Confederate.	Feb. 16, 1862.	Tarsal bones of left foot comminuted; soft parts lacerated.	Feb. 18, 1862.	Pirogoff's amputation at left ankle joint.	Died Feb. 22, 1864, of double pneumonia.
100	*Watts, W. T.*, Pt., G, 4th Virginia, age 27.	July 3, 1863.	Shot fracture left foot, opening ankle joint; also fracture of right os calcis.	July 3, 1863.	Syme's amputation at left ankle joint. Surgeon J. M. Hayes, C. S. A.	Aug. 20, sloughing of right foot. Died Aug. 29, 1863, of pyæmia.
101	Webb, J. D., Corp'l, F, 87th Indiana.	Sept. 19, 1863.	Shot wound of right foot	Sept. 19, 1863.	Amputat'n at right ankle joint.	Died Oct. 18, 1863, of wounds.
102	[3] *I*——, *M.*, —, 45th Georgia.	Mar. 25, 1865.	Rifle ball perforated the ankle joint.	Mar. 26, 1865.	Syme's amputation at ankle joint.	Forty days after operation discharging sinuses indicating dead bone. Result doubtful.
103	Marshall, W. E, col'd cook, K, 2d Michigan.	June 8, 1864.	Wound of right foot by solid shot.	———	Primary amputation in right foot at ankle joint. Surg. H. E. Smith, 27th Michigan.	Result undetermined. Not a pensioner.

[1] An abstract of this case was published in *Circular* No. 6, S. G. O., Washington, 1865, p. 47. See *Photographs of Surgical Cases*, A. M. M., Vol. II, p. 25, and Smith (S.), *Amputations at the Ankle Joint in Military Surgery*, in *U. S. San. Com. Memoirs*, Surgical Volume II, pp. 116, 132.

Intermediary Amputations at the Ankle Joint.—This group comprises thirty-nine cases; twenty-five terminated in recovery and fourteen in death, a mortality rate of 35.9 per cent. Thirty-four were Union, and five Confederate soldiers.

Recoveries after Intermediary Amputations at the Ankle Joint.—Of the twenty-five successful intermediary amputations at the ankle joint, ten were performed after Pirogoff's and thirteen after Syme's method; in two cases the mode of operation was not indicated. Of the patients, five were Confederate and twenty Union soldiers. The latter were all pensioned; but one has since died of phthisis. In seven instances re-amputations in the leg became necessary—in two in the lower, in two in the middle, and in two in the upper third; in one the point of re-amputation was not specified.

CASE 880.—Private P. Carter, Co. I, 7th Michigan, aged 22 years, was wounded at Fredericksburg, December 11, 1862. Surgeon G. S. Palmer, U. S. V., recorded his admission to the field hospital of the 2d division, Second Corps, with "shot fracture of right foot. Treatment of simple dressings." Two weeks after the reception of the injury the wounded man was transferred to Lincoln Hospital, Washington, where Syme's amputation at the ankle joint was performed, on December 26th, by Assistant Surgeon G. M. McGill, U. S. A. The patient recovered, and was discharged from service March 2, 1863, and pensioned. Several years afterwards he was fitted with an artificial foot by Dr. E. D. Hudson, of New York City. Dr. A. B. Ranney, of Bronson, Michigan, testified, June 25, 1875: "I have been Carter's family physician for the past three years and have examined him to-day. His right leg from the knee down is withered to the bone. The foot was taken off at the ankle joint, and there was no cushion left for the end of the bone to rest upon. At times the end of the bone is exposed and very painful, and much of the time there is discharge from the stump. I have treated him with poor success at various times during the years 1872, 1873, and 1874, and have advised an amputation of the limb at the knee, as it would, in my opinion, give him less trouble than at present," etc. The pensioner was paid March 4, 1881. A part of the amputated foot (*Spec.* 4859), showing fracture of the calcaneum and cuboid bone by a conoidal ball, was contributed to the Museum by the operator.

CASE 881.—Private W. A. Elderkin, Co. C, 6th Maine, aged 24 years, was wounded at Rappahannock Station, November 7, 1863, by a minié ball, which entered the dorsum of the right foot, fracturing the metatarsal bones, and making its exit at the plantar surface. Two days afterwards he was admitted to Harewood Hospital at Washington, where the wound became gangrenous about November 23d. For this a local treatment of nitric acid and oakum dressing was applied and a constitutional treatment of tonics, stimulants, and beef tea diet was administered. The disease, however, not being arrested and the patient growing weaker, operative interference became necessary, and Pirogoff's amputation was performed on December 6th by Surgeon R. B. Bontecou, U. S. V. After the operation the parts were kept properly adjusted and the supporting treatment was continued. About January 4, 1864, the progress of the case was interrupted by erysipelas making its appearance, followed by sloughing of the soft parts to some extent. Tincture of chloride of iron was then prescribed and wheat flour was applied locally. The inflammation was arrested in about two weeks, after which the patient's health improved daily and the wound healed rapidly. He was discharged from service with a useful stump April 23, 1864, and pensioned. The amputated part of the foot (*Spec.* 2028), contributed with the history by the operator, is represented in the annexed cut (FIG. 349), and shows the metatarsus to have been badly shattered, some of the fragments being necrosed and a slight effusion of callus having occurred in the neighboring parts. After receiving his discharge the patient was supplied with a "Palmer" artificial foot, which, however, did not prove satisfactory, and is reported to have become entirely useless in about two months. The pensioner died December 14, 1866, his physician, Dr. A. G. Peabody, of Machias, Maine, certifying that "death was caused by consumption arising from hardship, exposure, and the loss of the foot, the amputated foot leaving a stump which never thoroughly healed, but remained a constant drain upon the vital powers of the man's constitution."

FIG. 349.—Portion of right foot, metatarsus shattered.—*Spec.* 2028.

CASE 882.—Private J. H. Short, Co. F, 140th Pennsylvania, aged 19 years, was wounded at Spottsylvania, May 12, 1864. Surgeon J. E. Pomfret, 7th New York Artillery, reported his admission to the field hospital of the 1st division, Second Corps, with "shot wound of left foot." Several days after receiving the injury the wounded man was sent to Washington, where he entered Harewood Hospital and suffered amputation of the foot. Surgeon R. B. Bontecou, U. S. V., who performed the operation, made the following report: "The wound was caused by a ball entering in front of the ankle joint, opening the same, and lodging against the astragalus. On his admission to Harewood Hospital the patient was suffering from irritative fever and the parts above the joint were considerably swollen. Syme's operation was performed on May 25th with favorable result, the patient improving rapidly and making a good recovery. Sulphuric ether constituted the anæsthetic used in the case. Simple dressings were used, and the treatment was supporting." The patient was subsequently transferred to hospital at Philadelphia and later to Pittsburgh, whence he was discharged from service November 4, 1864, and pensioned. His photograph, taken at Harewood Hospital and contributed by the operator, is copied in FIGURE 3 of PLATE LXXV, opposite page 596. In his applications for commutation the pensioner continues to describe the condition of the stump as "very good and sound." He was paid September 4, 1880.

CASE 883.—Private W. Darling, Co. E, 6th Wisconsin, aged 41 years, was wounded in the left foot, at Antietam, September 17, 1862. He was admitted to hospital at Smoketown, where the limb was amputated three weeks after the date of the

injury. Surgeon B. A. Vanderkieft, U. S. V., who performed the operation, reported that the patient recovered and was discharged from service January 13, 1863. The man became a pensioner, and was subsequently furnished with an artificial foot by Dr. E. D. Hudson, of New York City, who contributed a cast of the stump (*Spec.* 4957), represented in the adjoining cut (FIG. 350), with the following description of the case: "The injury consisted of a comminution of the tarsus and calcaneum, and the amputation was performed at the ankle joint by Bauden's dorsal flap, the tibia and fibula being left in their entire length with the exception of the malleoli." In his applications for commutation the pensioner continued to report the stump as being in "good condition." He was paid September 4, 1880.

FIG. 350.—Stump of left leg after BAUDEN'S amputation at the ankle. *Spec.* 4957.

CASE 884.—Private J. Loughlin, Co. K, 67th New York, age 22 years, was wounded in the left foot, at Malvern Hill, July 2, 1862. He entered Fourth and George Streets Hospital, Philadelphia, several weeks afterwards, whence Acting Assistant Surgeon J. B. Bowen reported the following history: "The injury was caused by a minié ball, which entered the external portion of the ankle, passing through, fracturing and comminuting the tarsal bones. The man was taken prisoner and sent to Richmond, where he remained about two weeks. Twelve days after the receipt of the wound a portion of stocking and shoe sloughed out. He suffered great pain and the wound discharged large quantities of purulent matter, also several pieces of bone. When released by the enemy he was transferred to a hospital transport, where Pirogoff's operation was performed on July 26th. The patient was received into this hospital the same day. Erysipelas invaded the stump and extended to the knee, and abscesses and sloughing appeared on the posterior surface. Amputation at the upper third of the leg was performed by flap operation on September 16th, by Acting Assistant Surgeon S. D. Gross. Since then the man has improved and the stump has united. The treatment embraced muriatic tincture of iron, quinine, whiskey, and morphine." The patient was subsequently transferred to Haddington Hospital, whence he was discharged from service July 29, 1863, and pensioned. About one year afterwards he was supplied with an artificial leg by Dr. E. D. Hudson, of New York City. The pensioner was last paid March 4, 1869, since when he has not been heard from. The bones, forming the Pirogoff stump and including the lower half of the shafts of the tibia and fibula (*Spec.* 214), were contributed to the Museum by the second operator, and are represented in the annexed cut (FIG. 351), showing the cut extremities of the tibia and calcis to be carious. No union whatever had occurred. The lower extremity of the fibula is also carious, and the upper portion of the shaft is necrosed and enlarged by attempts at an involucrum from the periosteum.

FIG. 351.—Bones of left leg after PIROGOFF'S amputation. *Spec.* 214.

Fatal Intermediary Amputations at the Ankle Joint.—Fourteen of these operations were recorded, eight by Pirogoff's and six by Syme's method. In one instance exarticulation at the ankle joint was followed by re-amputation in the middle, and in two by ablation in the upper thirds of the leg. The fatal issue was ascribed to pneumonia in one, pyæmia in three, tetanus in one, erysipelas in two, exhaustion in four, and typhoid fever in one instance. In one case the right arm had been amputated in the upper third.[1]

CASE 885.—Private S. Smith, Co. K, 86th New York, aged 47 years, was wounded at the Wilderness, May 10, 1864, by two minié balls, one of which passed through the left foot and fractured the tarsal bones; the other produced a flesh wound of the dorsal region near the spine. Several days after receiving the injury the wounded man was admitted to Harewood Hospital, Washington, where he did well up to May 23d. From that date his mind became wandering and delirious, his left arm and right leg keeping up constant motion. Irritation from the wound was suspected as the cause of this unusual action, and amputation was deemed necessary on May 25th, when Surgeon R. B. Bontecou, U. S. V., performed the operation by his modification of Pirogoff's method at the ankle joint. The patient improved after the amputation, all symptoms of derangement of mind disappeared, and he became perfectly conscious. Ether was used as the anæsthetic. The patient continued to do well up to June 1st, when pyæmic symptoms appeared, the wound ceased to suppurate, and rigors set in; skin hot and dry. In spite of a supporting treatment the patient gradually grew weaker. He died July 19, 1864. The tarsal bones, together with the malleoli and a thin section of the tibia, removed at the amputation (*Spec.* 3054), with the history, were contributed to the Museum by the operator.

CASE 886.—Private D. C. Hayes, Co. A, 4th New Hampshire, was wounded at the battle of Pocotaligo, October 22, 1862, by a minié ball, which struck the dorsum and penetrated to the sole of the left foot, passing out nearly opposite the point of entrance without having caused much apparent comminution or splintering of the bone. He was admitted to hospital at Hilton Head the following day, whence Assistant Surgeon J. E. Semple, U. S. A., contributed the pathological specimen (No. 691) with the following report: "We endeavored to save the foot, but the patient became much reduced and mortification set in. Syme's operation was performed on November 11th, and death occurred on the following day from exhaustion." Acting Assistant Surgeon T. T. Smiley, who performed the amputation, states in his publication of the case[2] that the patient died with all the symptoms of pyæmia, also that the injury produced violent pain and high inflammation, which he ascribed to a longitudinal fracture of one of the metatarsal bones, opening the tarso-metatarsal articulation. The specimen consists of a ligamentous preparation of the scaphoid, cuboid, cuneiform, and metatarsal bones of the amputated foot, the bases of the second and third of the latter exhibiting the seat of the fracture by the bullet.

TABLE XCI.

Summary of Thirty-nine Cases of Intermediary Amputations at the Ankle Joint for Shot Injury.

[Recoveries, 1—25; Deaths, 26—39.]

No.	Name, Military Description, and Age.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	*Atwell, J. J.*, Pt., A, 8th Virginia, age 20.	July 3, 1863.	Conoidal ball entered instep and lodged among the tarsal bones of left foot.	July 17, 1863.	Syme's amputation at left ankle joint. A. A. Surgeon T. T. Smiley.	Paroled Nov. 12, 1863; stump healed.
2	[1]Bayard, J., Pt., B, 28th N. York, age 28.	July 6, 1861.	Musket ball passed through instep, fracturing tarsal bones of left foot.	July 11, 1861.	Syme's amp. left ankle joint. Ass't Surgs. J. W. S. Gouley and W. J. White, U. S. A.	Discharged July 24, 1861; pensioned. Serviceable extremity.
3	Burns, C. E., Pt., D, 12th Massachusetts, age 24.	Aug. 29, 1862.	Fracture of right foot, involv'g ankle joint, by musket ball.	Sept. 13, 1862.	Syme's amputation at right ankle joint. Surgeon D. P. Smith, U. S. V.	Cushion one inch thick, well united to tibia, and quite tender. April 22, 1863, amp. lower third leg. Discharged July 11, 1863; pensioned.
4	[2]*Butler, W. M.*, —, K, 7th Arkansas.	Sept. 20, 1863.	Ball passed through right foot.	Oct. 3, 1863.	Pirogoff's amputation at right ankle joint.	Hæmorrhage from plantar arch. Doing well.
5	Carter, P., Pt., I, 7th Michigan, age 22.	Dec. 11, 1862.	Conoidal ball comminuted os calcis and cuboid bones, right foot.	Dec. 26, 1862.	Syme's amputation at right ankle joint, posterior flap. Ass't Surg. G. M. McGill, U. S. A.	Discharged March 2, 1863; pensioned. Leg withered to knee; troublesome stump; at times bones exposed and painful. *Spec.* 4859, A. M. M.
6	[3]*Clark, F. W.*, Pt., B, 12th Georgia.	May 10, 1864.	Conoidal ball fractured astragalus and third and fourth metatarsal bones.	May 28, 1864.	Pirogoff's amputation at ankle joint. Surgeon C. B. Gibson, C. S. A.	Recovered. Heel drawn up; a tender cicatrix formed part of sole of stump.
7	[4]Cook, G. L., Pt., B, 1st Pennsylvania, age 22.	June 30, 1862.	Conoidal ball passed through right instep, fracturing tarsal and metatarsal bones.	July 23, 1862.	Syme's amputation at right ankle.	Aug. 1, straps to stump. Disch'd Dec. 7, 1862; pens'd. Stump healed perfectly.
8	Darling, W., Pt., E, 6th Wisconsin, age 41.	Sept. 17, 1862.	Conoidal ball fractured left tarsus and calcaneum.	Oct. 8, 1862.	Syme's modified amputation at ankle joint, dorsal flap. Surg. B. A. Vanderkieft, U. S. V.	Discharged January 13, 1863; pensioned. *Spec.* 4957, A. M. M.
9	Dickey, W. H., Serg't, A, 8th Pennsylvania Reserves, age 28.	Dec. 13, 1862.	Conoidal ball fractured the left foot.	Dec. 24, 1862.	Syme's amputation at left ankle joint. Surg. H. Bryant, U. S. V.	Abscess. Discharged Dec. 10, 1863; pensioned. Stump perfectly healed. *Spec.* 575, A.M.M.
10	Elderkin, W. A., Pt., C, 6th Maine, age 24.	Nov. 7, 1863.	Musket ball entered dorsum of right foot, fracturing metatarsal bones.	Dec. 6, 1863.	Pirogoff's amputat'n with Bontecou's modification. Surg. R. B. Bontecou, U. S. V.	Erysipelas; sloughing. Disch'd April 23, 1864. Stump never healed thoroughly, and was a constant drain upon the vital powers. Died Dec. 14, 1866, of consumpt'n. *Spec.* 2028, A.M.M.
11	Forsyth, G., Pt., E, 14th N. Jersey, age 25.	May 13, 1864.	Conoidal ball injured left foot.	May 18, 1864.	Pirogoff's amputation at left ankle joint.	Discharged April 6, 1865, and pensioned.
12	[5]Gross, D. N., Pt., E, 8th Illinois Cavalry, age 24.	June 29, 1862.	Canister shot comminuted the right astragalus and carried away ends of both malleoli.	July 22, 1862.	Syme's amput'n at right ankle joint. Ass't Surg. R. Bartholow, U. S. A.	Necrosis. Discharged December 7, 1863; pens'd. Good stump.
13	Gurley, W., Pt., C, 11th Infantry, age 18.	May 12, 1864.	Conoidal ball entered below external malleolus and crushed posterior tuberosity of os calcis.	June 1, 1864.	Amputat'n at right ankle joint. Surgeon D. W. Bliss, U. S. V.	Necrosed sequestra removed at different times. Disch'd Feb. 7, 1865. Amp. upper third leg Feb. 18, '68. *Spec.* 2421, A.M.M.
14	Johnson, A. W., Pt., E, 64th New York, age 23.	Dec. 13, 1862.	Ball entered between extensor longus pollicis and calcaneum, fracturing bones of foot.	Dec. 20, 1862.	Syme's amputation at left ankle joint. Surgeon C. Gray, 7th New York.	Discharged Jan. 29, 1863; pensioned. Oct. 9, 1863, amput'n lower third leg.
15	[6]Larkin, P., Pt., C, 48th N. York, age 24.	July 18, 1863.	Piece of shell comminuted tarso-metatarsus except calcis, right foot.	July 25, 1863.	Pirogoff's amputation at right ankle joint. Ass't Surg. J. W. Applegate, U. S. V.	Discharged Dec. 4, 1863. Amp. leg at middle third May 6, 1879, for necrosis. *Spec.* 6913, A.M.M.
16	Loughlin, J., Pt., K, 67th New York, age 22.	July 2, 1862.	Conoidal ball perforated left ankle, comm'g tarsal bones.	July 26, 1862.	Pirogoff's amputation at left ankle joint.	Erysipelas. Sept. 16, amput'n of leg, upper third. Disch'd July 29, 1863; pensioned. Not heard from since March 4, 1869. *Spec.* 214, A. M. M.
17	Morse, G. F., Pt., K, 16th Massachusetts, age 19.	May 1, 1862.	Shot fracture of left foot.....	May 16, 1862.	Pirogoff's amputation at left ankle joint. Surgeon C. C. Jewett, 16th Massachusetts.	Discharged August 4, 1862, and pensioned. Good stump; can bear his weight upon it.
18	*Newton, J. W.*, Pt., E, 14th Virginia, age 26.	July 2, 1863.	Conoidal ball fractured tarsal bones of right foot.	July 16, 1863.	Pirogoff's amputation at right ankle joint.	July 25, sloughing. August 10, amp. at junction of upper thirds of leg; stump healed. Exch'd November 12, 1863.
19	[7]Ramsdell, J. H., Pt., C, 8th Minnesota, age 30.	Dec. 7, 1864.	Conoidal ball passed through tarsus from dorsum to heel.	Dec. 16, 1864.	Amputation at left ankle joint by Syme's method. Surgeon S. D. Turney, U. S. V.	Discharged June 4, 1865; pensioned. Stump sound and reliable for support.
20	Sanford, A. C., Pt., E, 6th Connecticut, age 27.	Aug. 16, 1864.	Conoidal ball fractured tarsal bones of left foot.	Sept. 14, 1864.	Circular amputation at left ankle joint by Syme's method. A. A. Surg. E. B. Woolston.	Discharged April 27, 1865, and pensioned. Stump healed.
21	Short, J. H., Pt., F, 140th Pennsylvania, age 19.	May 12, 1864.	Ball lodged against astragalus, left foot; tarsus comminuted.	May 25, 1864.	Syme's amp. at left ankle joint. Surg. R. B. Bontecou, U. S. V.	Discharged Nov. 4, 1864; pens'd. *Card Phot.*, Vol. I, p. 45.
22	Strout, S., Capt. After Guard, U. S. Navy, age 38.	April 1, 1865.	Pistol shot wound of right foot.	April 15, 1865.	Amputat'n at right ankle joint. Surgeon — Smith, U. S. N.	Discharged June 5, 1865; pensioned. Sound stump.
23	[8]Unknown, age 24.....	Nov. 25, 1863.	Shot fracture of left tarsus ...	———	Intermediary amp. at left ankle joint by Pirogoff's method. Prof. P. F. Eve.	January, 1864, complete disintegration of calcis and end of tibia. Feb., 1864, amp. leg. Recov'ry.
24	Whitney, P. P., Pt., A, 6th Michigan, age 24.	Aug. 5, 1862.	Shot wound of right foot.....	Aug. 16, 1862.	Pirogoff's amp. at ankle joint, leaving portion of os calcis. Surg. E. F. Sanger, U. S. V.	Discharged October 4, 1862; pensioned.

No.	Name, Military Description, and Age.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
25	Whitty, J., Pt., A, 6th Wisconsin, age 22.	May 5, 1864.	Conoidal ball fractured left calcaneum.	May 31, 1864.	Syme's amputat'n at left ankle joint. Surgeon E. Donnelly, 2d Pennsylvania Reserves.	Gangrene in stump. Feb. 8, 1865, amputation at junction of lower third of leg. Discharged June 26, 1865; pensioned.
26	*Alley, J.*	July 2, 1863.	Conoidal ball fractured left tarsal bones; also flesh wounds of thigh and shoulder.	July 15, 1863.	Syme's amputat'n at left ankle joint.	Died July 16, 1863, of tetanus.
27	Bager, A., Pt., K, 2d Maryland.	Dec. 13, 1862.	Shot fracture of right foot.....	Jan. 9, 1863.	Pirogoff's amp. at right ank. j't. A. A. Surg. J. R. Ludlow.	Stump done well. Died Feb. 21, 1863, of pneumonia.
28	Gregg, R., Pt., C, 1st Maine Artillery, age 37.	June 18, 1864.	Shot wound of right foot, with great injury to tarsus.	July 12, 1864.	Syme's amput'n at right ankle joint. A. A. Surgeon O. W. Peck.	Sloughing. July 18, 1864, amp. of leg at junction of upper third. Died Sept. 30, 1864.
29	Havens, W., Pt., K, 17th N. York Heavy Artillery, age 29.	June 25, 1864.	Conoidal ball injured 2d and 3d toes, right foot. June 25, '64, amp. of injured toes; gang.	July 14, 1864.	Pirogoff's amp. at right ankle joint. Surg. R. B. Bontecou, U. S. V. Sloughing; gang.	July 19, amputation leg, middle third. Died July 21, 1864, of exhaustion.
30	[1]Hayes, D. C., Pt., A, 4th New Hampshire.	Oct. 22, 1862.	Conoidal ball fractured 2d metatarsal bone and injured tarsal articulation, left foot.	Nov. 11, 1862.	Syme's amput'n at ankle joint. A. A. Surgeon T. T. Smiley.	Died Nov. 12, 1862, of pyæmia. *Spec.* 691, A. M. M.
31	Haynes, G., Pt., F, 12th N. Hampshire, age 22.	June 3, 1864.	Shot wound left foot near malleolus, fractur'g tarsal bones; exit near little toe.	June 30, 1864.	Joint diseased and œdematous. Syme's amp. at left ankle j'nt. Surg. R. B. Bontecou, U. S. V.	Died, from typhoid fever, July 9, 1864.
32	Johnson, H. H., Pt., A, 9th N. York Heavy Artillery, age 18.	July 9, 1864.	Shell fracture 4th and 5th metatarsal bones; extensive laceration of soft parts.	July 12, 1864.	Syme's amp. at right ankle j'nt. Ass't Surg. R. F. Weir, U. S. A. Malleoli sawn off; articular surface of tibia left intact.	July 18, extensive erysipelas, extending to abdomen. Died July 28, 1864, of erysipelas. *Spec.* 2281, A. M. M.
33	Lincoln, G., Pt., 9th Illinois, age 27.	Feb. 15, 1862.	Rifle ball fractured tarsal and metatarsal bones.	Feb. 25, 1862.	Pirogoff's amputation at ankle joint. Dr. T. L. Maddin, of Nashville.	Feb. 25, erysipelas; March 2, whole body involved. Died March 8, 1862, of erysipelas.
34	Phillips, J., Pt., I, 5th Michigan, age 31.	May 10, 1864.	Conoidal ball fract'd left tarsal bones, leaving os calcis intact.	May 17, 1864.	Pirogoff's amp. at left ankle j't. Surgeon E. Bentley, U. S. V.	Died May 28, 1864, of exhaustion.
35	Schoneckles, F., Pt., G, 2d Delaware.	Dec. 13, 1862.	Shot fracture of bones of right foot; also fracture of right humerus.	Dec. 19, 1862.	Pirogoff's amp. at right ankle joint; also amp. arm at upper third. Surgs. C. S. Wood, 66th N. Y., and C. Gray, 7th N. Y.	Died.
36	Shook, G. L., Corp'l, C, 37th Massachusetts, age 25.	Sept. 19, 1864.	Conoidal ball fractured left foot.	Sept. 26, 1864.	Pirogoff's amp. at left ankle joint, leaving a portion of os calcis. A. A. Surg. J. Younglove.	Died October 14, 1864.
37	Smith, S., Pt., K, 86th New York, age 47.	May 10, 1864.	Conoidal ball fractured tarsal bones, left foot; also flesh wound of back.	May 25, 1864.	Pirogoff's amp. at left ankle j't with Bontecou's modification. Surg. R. B. Bontecou, U. S. V.	Died June 19, 1864, of pyæmia. *Spec.* 3054, A. M. M.
38	[2]Sutton, E. L., Pt., H, 77th Illinois.	Jan. 11, 1863.	Conoidal ball fractured 2d and 3d metatarsal bones, left foot, involving tarsal articulation.	Jan. 24, 1863.	Syme's amputat'n at left ankle joint. A. A. Surgeon T. T. Smiley.	Died Feb. 3, 1863, of pyæmia.
39	Wilbur, W., Pt., B, 1st New York Cavalry, age 27.	May 8, 1864.	Shot fracture of 2d and 3d metatarsal bones of right foot.	May 28, 1864.	Pirogoff's method with Bontecou's modification. Surgeon R. B. Bontecou, U. S. V.	July 6, amputation of leg, upper third. Died July 6, 1864, of exhaustion.

Secondary Amputations at the Ankle Joint.—Thirteen secondary amputations at the ankle joint were recorded; the mortality rate was 7.7 per cent., only one of the cases having a fatal termination. Of the twelve successful operations four were performed after Pirogoff's and six after Syme's method; in two cases the mode of ablation was not indicated. Eight of the patients were Union and four Confederate soldiers. In one instance the leg was subsequently amputated in the middle third. Of the eight Union soldiers the names of seven were found on the Pension Rolls; two have died since their discharge from the service. In the fatal secondary amputation at the ankle Syme's operation had been performed; the patient died of exhaustion.

Case 887.—Private O. C. Crandall, Co. B, 7th Wisconsin, aged 19 years, was wounded in the right foot, at Gettysburg, July 1, 1863. He remained at a First Corps field hospital for nearly two weeks and was then removed to Broad and Cherry Streets Hospital, Philadelphia, whence Acting Assistant Surgeon W. V. Keating contributed the following history: "The wound was caused by a minié ball, which entered on the outer side just in advance of the ankle joint and passed directly across, fracturing the astragalus and lodging beneath the skin on the inner side of the foot, whence it was removed four hours after the reception of the injury. At the time of admission his general condition was broken down, and the foot and ankle were much inflamed, swollen, and painful; the wounds discharging sanious pus. The patient was ordered extra diet, with tonics, milk punch, and beef-essence, and the foot was enveloped in a fomenting poultice. Five days after admission the wounds commenced to slough and a large abscess formed on the outer side of the foot above the wound, in its course burrowing the tendo-achillis. At the same time the patient was rapidly growing weaker. On August 1st it was decided, in consultation, that to operate was the only means of saving life, and on the following day, while the patient was under the influence of ether, Pirogoff's amputation was performed by Acting Assistant Surgeon A. Hewson. The edges of the flaps were brought together by means of lead-wire sutures, and an opening was made along the side of the tendo-achillis to prevent the collection of pus. The stump was covered with lint saturated

Fig. 352.—Portions of tibia, fibula, astragalus, and calcaneum, from a Pirogoff amputation. *Spec.* 2783.

[2] Smiley (T. T.), *Gunshot Wounds from Arkansas Post*, in *Boston Med. and Surg. Jour.*, 1863, Vol. LXIX, p. 159.

with a mixture of laudanum and whiskey, and the limb was kept at perfect rest in a fracture-box. On the third day after the operation sloughing took place to a slight extent on the outer side of the stump in the line of the first incision, exposing the lower extremity of the fibula. The stump was then washed with a solution of permanganate of potassa and a fomenting poultice was applied. The discharge from the stump was very profuse for a few days, but it gradually subsided and healthy granulations established themselves. The patient continued to do well afterwards, bony union taking place and the case promising a good and useful stump, with the limb one inch shorter than the other. The patient's general condition now was very good. The advantages claimed for the operation in this case were, firstly, that it was less extensive than an amputation higher up in the leg and thereby produced less shock; secondly, that less blood would in all probability be lost, and the patient would have a greater length of limb for actual use after recovery." The specimen (No. 2783) represented in the adjoining wood-cut (FIG. 352) was contributed by the operator, and consists of the lower borders of the tibia and fibula, the astragalus, and a slice of the upper portion of the calcaneum, all which were removed at the amputation. The astragalus is shown to be fractured and carious, and the tibial articulation is eroded. The patient was subsequently transferred to Mower Hospital, whence he was discharged June 11, 1864, and pensioned. He formerly represented the stump as being in a good state, but at a special examination on March 16, 1880, its condition was described by Dr. T. B. Mansfield, pension examiner at Sac City, Iowa, as follows: "I find the claimant suffering from necrosis of the end of the stump of the tibia, also atrophy of the muscles of the lower leg. There is some discharge at present from the wound, and the cicatrices present an unhealthy condition, assimilating senile or dry gangrene. The general appearance and appetite of the pensioner is good. He states that he has constant pain in the wound and constant pain in the knee, and that he is unable to walk but a short distance without experiencing great pain in the stump and entire limb. I think his wound will necessitate another amputation." This pensioner was paid June 4, 1880.[1]

CASE 888.—Private I. T. Mossup, Co. D, 100th New York, aged 30 years, was wounded in the left foot, during the assault on Fort Wagner, July 18, 1863. He was admitted to hospital at Beaufort on the following day, and several months later he was transferred to McDougall Hospital, at Fort Schuyler, where amputation was performed but not recorded. Subsequently the patient passed to De Camp Hospital, and lastly, on February 18, 1864, he entered Central Park Hospital, New York City. Surgeon B. A. Clements, U. S. A., in charge of the latter, made the following report: "The patient had been wounded by a conical ball, which passed just under the malleoli, fracturing the astragalus and calcaneum. Amputation at the ankle joint was performed at McDougall Hospital, on November 11th, by Syme's method, and the result has not been retarded by any accident whatever since the operation, the cicatrix being completely formed when the patient was admitted to Central Park Hospital. He has an artificial foot (from Hudson), and at his own request his discharge has been recommended." A cast of the leg (*Spec.* 726), made nine months after the amputation, and showing a well-formed and apparently useful Syme's stump, was contributed to the Museum by Assistant Surgeon J. W. S. Gouley, U. S. A., and is represented in the annexed wood-cut (FIG. 353). The patient was discharged from service June 1, 1864, and pensioned. In his applications for commutations, dated 1870 and 1875, he described the stump as being in "good condition," but five years later he reported it as "painful all the time." The pensioner was paid December 4, 1880.[2]

FIG. 353.—Stump after SYME'S amputation at left ankle. *Spec.* 726.

TABLE XCII.

Summary of Thirteen Cases of Secondary Amputations at the Ankle Joint for Shot Injury.

[Recoveries, 1—12; Deaths, 13.]

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	[3]Connolly, P., Corp'l, K, 70th New York.	Aug. 27, 1862.	Conoidal ball comminuted left tarsus.	Nov. 19, 1864.	Foot a large shapeless mass. Syme's amp. at left ankle j't; tibia sawn through above malleoli. A. A. Surg. S. Smith.	Discharged Aug. 13, 1863; pensioned. In 1870, stump sound; receives entire weight of body on stump; 2½ ins. shortening.
2	[4]Crandall, O. C., Pt., B, 7th Wisconsin, age 19.	July 1, 1863.	Conoidal ball fractured astragalus and was removed from inner side of foot.	Aug. 2, 1863.	Foot and ankle much inflamed; slough'g; Pirogoff's amput'n. A. A. Surg. A. Hewson.	Limb kept in a fracture-box; sloughing. Disch'd June 11, 1864; pensioned. *Spec.* 2783.
3	*Ewing, A. G.*, Pt., Forrest's Cavalry.	July —, 1864.	Shell fracture of right foot; caries of ends of tibia and fibula.	Aug. —, 1865.	Pirogoff's amputation at right ankle joint. Prof. P. F. Eve.	Also partial paralysis from pistol ball in spine. Recovered; caries of ends of tibia and fibula.
4	*Griffin, J. B.*, Lieut., C, 10th Texas Cavalry.	Dec. 31, 1862.	Shot wound of left ankle joint.	Mar. 9, 1863.	Amp. at left ankle joint. Surg. F. Hawthorne, P. A. C. S.	Recovery.
5	[5]Johnes, A., Corp'l, E, 5th New York, aged 27.	June 27, 1862.	Conoidal ball passed through tarsal bones of the right foot; sloughing.	Aug. 4, 1862.	Syme's amputation at right ankle joint. Ass't Surg. R. Bartholow, U. S. A.	Erysipelas; stump healed. Discharged Dec. 6, 1862. Died March 28, 1880, of consumption.
6	[6]Mossup, I. T., Pt., D, 100th New York, age 30.	July 18, 1863.	Conoidal ball fractured left astragalus and calcaneum.	Nov. 11, 1863.	Syme's posterior flap amputation. A. A. Surgeon J. B. Cutter.	Disch'd June 1, 1864; pensioned. Two ins. shortening; limb somewhat atrophied, tissue healthy, compact and symmetrical. *Spec.* 726, A. M. M.
7	O'Donahue, M., Pt., D, 124th Ohio, age 36.	May 4, 1864.	Musket ball injured right foot. Primary amput'n 3d and 4th toes with metatarsal bones; re-amputation.	Nov. —, 1866.	Pirogoff's amputation at right ankle joint. Prof. C. E. Weber, of Cleveland.	Discharged Dec. 27, 1864, and pens'd. Stump healed. Died April 13, 1873.
8	Porter, L. S., Pt., F, 49th Ohio, age 32.	Dec. 31, 1862.	Shell fracture of left ankle	Feb. 25, 1863.	Syme's amputation at left ankle joint.	Disch'd Dec. 6, 1863, and pens'd. Stump healed, but is troublesome and causes pain.
9	[7]R——, F.....	Dec. 9, 1864.	Musket ball passed through tarsus.	Jan. 20, 1865.	Syme's amput'n at ankle joint. Dr. G. Buck, New York city.	Stump firm and useful. Two inches shortening.

No.	Name, Military Description, and Age.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
10	*Rooney, J. S.*, Pt., D, 37th Georgia.	Sept. 20, 1863.	Shot wound in front of foot....	Oct. 26, 1863.	Pirogoff's amputat'n; resection of tibia and calcis.	Doing well November 1, 1863.
11	*Taylor, J. W. I.*, Pt., A, 3d Arkansas, age 23.	Sept. 20, 1863.	Shot wound of right foot.....	April 13, 1864.	Disarticulation right foot at the ankle joint.	Retired November 30, 1864.
12	Wells, G. W., Pt., K, 4th New Hampshire, age 24.	Aug. 16, 1864.	Conoidal ball fract'd metatarsal bones, right foot. Necrosis of tarsus and metatarsus.	Oct. 22, 1864.	Syme's amputation at right ankle joint. A. A. Surg. G. A. Chesley.	Sloughing. Discharged Jan. 11, 1865; pensioned. Jan. 16, 1865, amp. of leg at middle third.
13	Frost, E. R., Pt., I, 32d Maine, age 44.	June 15, 1864.	Ball entered inner side of right foot at mid. of first metatarsal bone; exit at base of 2d and 3d toes; prim. amp. 2d and 3d toes.	July 18, 1864.	Syme's amputation at right ankle joint. Surg. R. B. Bontecou, U. S. V.	Gangrene; hæmorrhage. Died July 23, 1864, of exhaustion. *Spec.* 3068, A. M. M.

Of three of the cases cited in the preceding table specimens are preserved in the Army Medical Museum.

Amputations at the Ankle Joint of Uncertain Date.—In six instances the date of the injury, or of the operation, or both were not recorded. Four, it would appear, recovered and two proved fatal. All were Confederate soldiers:

Table XCIII.

Summary of Six Cases of Amputations at the Ankle Joint for Shot Injury of Uncertain Date.

[Recoveries, 1—4; Deaths, 5–6.]

No.	Name, Military Description, and Age.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	*Crenshaw, J. W.*, Pt., A, 45th Georgia.	June 2, 1864.	Shot wound.....	———	Amputation at ankle joint.....	Furloughed July 12, 1864.
2	*Lawson, M.*, Serg't, F, 21st North Carolina.	Feb. 6, 1865.	Shot fracture of right foot.....	———	Amputation at right ankle joint.	Furloughed March —, 1865.
3	*Lloyd, J. T.*, Pt., K, 8th Georgia.	Aug. 13, 1864.	Shot wound of right foot.....	———	Amputation at right ankle joint.	Furloughed October 14, 1864.
4	*Ogburn, C. J.*, Pt., D, 57th North Carolina.	May 4, 1863.	Shot wound of foot.....	———	Pirogoff's amputation at ankle joint.	Furloughed June 12, 1863.
5	*Clark, A.*, Pt., D, 6th South Carolina.	———	Shot wound of foot.....	———	Amputation at ankle joint.....	Died June 27, 1864.
6	*Rogers, J. M.*, Pt., G, 48th Georgia.	——— 1862.	Shot wound of foot.....	——— 1862.	Amputation at ankle joint.....	Died September 15, 1862.

Sixty-two of the one hundred and sixty-one cases of amputations at the ankle joint recorded in the preceding pages were performed on the right, eighty-two on the left side; in seventeen instances the side was not indicated.

CONCLUDING OBSERVATIONS ON SHOT INJURIES OF THE ANKLE JOINT.—As far as the records of military surgery indicate, attempts at conservation of the limb in severe shot wounds of the ankle joint were rarely made during the first half of the present century. In cases in which the joint was opened, or in which the lesion of the bones forming the joint was extensive, amputation in the leg, or, if practicable, exarticulation at the ankle, were resorted to, in conformity with the teachings of Desport, Thomson, Hennen, and Williamson.[1] The experience of the surgeons of the American civil war would seem to have led to similar conclusions. Surgeon T. H. Squire,[2] 89th New York Volunteers, from his experience in the hospitals after the battle of Antietam, asserts that "every ankle joint opened by a ball, with any considerable injury of articular bones, should

[1] Desport (*Traité des plaies d'armes a feu*, Paris, 1749, p. 232): "Si la balle passe dans l'articulation et fracasse les os, l'amputation est nécessaire, et ne peut être trop tôt faite." Thomson (J.) (*Report of Observations made in the British Military Hospitals in Belgium after the Battle of Waterloo, etc.*, Edinburgh, 1816, p. 143): "The injuries of the ankle joint might be said to be almost equally severe with those of the knee joint. . . The swelling of this joint was proportionally greater than even that of the knee. Fungous granulations protruding through the wounds were more common, but the constitutional symptoms, though in particular instances severe, were, in general, far less so than in gunshot wounds of the knee joint." Hennen (J.) (*Principles of Military Surgery*, London, 1829, p. 157): "However desirable it may be to save a hand or a foot, yet, in severe and complicated lacerations of the wrist and ankle joints, the frequency of tetanic affections should at once lead us to adopt immediate amputation." Williamson (G.) (*Military Surgery*, London, 1863, p. 159): "When the fracture takes place near the ankle and a fissure extends into the joint, it is rarely that the patient recovers."

[2] Squire (T. H.), *Field Note Book; Case Book* No. 16, Division of Surgical Records, Surgeon General's Office, p. 59.

be amputated, and the quicker the better." Surgeon A. J. Phelps,[1] U. S. V., Medical Director of the Fourth Army Corps, declared, after the battle of Chickamauga: "In my mind there is no question upon the necessity of amputation in cases of knee joint injury (gunshot); and it is also my opinion that the same treatment is scarcely less necessary in wounds of the tarsus and ankle joint." Surgeon J. T. Woods,[2] 99th Ohio Volunteers, after the battle of Chickamauga "found the early history of these cases exceedingly flattering, and affording ample reason to warrant an effort to save the limb in injuries of this class; but at a later date the incapability of nature's power of reparation became apparent, * * the unwarrantableness of conservatism(?) in these cases is most obvious, every indication presented by them warranting the conclusion that, after much suffering and great exhaustion, the choice is still between death and loss of foot." Surgeon H. S. Hewit,[3] U. S. V., in charge of the hospitals at Frederick after the battle of Antietam, expressed the opinion that "amputation of the leg ought to be performed in every case of gunshot penetration and fracture of the ankle joint." A year later, Surgeon Hewit,[4] then Medical Director of the Department of the Ohio, counseled the medical officers under his charge that "amputation was to be employed in almost every penetrating injury of the ankle joint," and made consultation obligatory in all doubtful cases of this injury. It is therefore not surprising that the number of amputations following injuries of the ankle joint, recorded during the war, is proportionally very large. Of one thousand seven hundred and eleven instances of shot injuries of the bones of the tibio-tarsal articulation, five hundred and eighteen were treated by expectant conservative measures, in thirty-three instances excision was practised, and in one thousand one hundred and sixty recourse was had to ablation of the limb either at the ankle joint, in the leg, or in the thigh. It may be assumed that the five hundred and eighteen cases treated by conservation were, as a rule, instances in which the injury was comparatively slight, and in which the articulation originally was not seriously involved. Of these five hundred and eighteen patients four hundred and seven recovered and ninety-nine, or 19.5 per cent., died; in twelve the ultimate result was not ascertained. Free incisions into the joint were frequently made, and in forty-one instances fragments of bone were eliminated; pyæmia was noted in twenty-eight, gangrene in twenty-two, erysipelas in twelve, and tetanus in five instances.

Examining the cases of recovery after conservative treatment of shot fractures of the bones of the ankle joint adduced at pp. 579 to 582, *ante*, it will be seen that the remote results in many instances were less satisfactory than the early progress of the cases had promised. In the case of Private J. H. Noble (CASE 820, p. 580, *ante*), in January, 1863, six months after the injury, the wound had healed and an anchylosed and serviceable limb was reported; but nearly a year later the patient was walking on crutches; the wound had reopened. In 1878, sixteen years after the injury, the pension examining board reported that the "parts broke out again and again, and discharged; the pensioner complains of more or less constant pain in the leg, and if he uses it much it swells and becomes painful, so that he is unable to sleep. He still has to use a cane; the leg is worse than useless." In the case of Sergeant T. B. Sturdivant (CASE 825, p. 582, *ante*), who was discharged in

1865, with "anchylosis of the ankle joint and extension of the foot," an ulcer formed on the outer side of the ankle and pieces of bone were discharged as late as 1880. Private Dutton (CASE 821, p. 581), when mustered out in June, 1865, was able "to walk a mile or two without difficulty," but several years later there were indolent ulcers at the inner as well as the outer side of the joint, and the patient was unable to walk; his disability was then reported as equal to loss of foot.

Excision at the Ankle Joint for Shot Injury.—The substitution of excision at the ankle joint for amputation effected no saving of life. Of the thirty-three cases in which this operation was practised, the results are known in thirty-one, of which nine, or 29.0 per cent., proved fatal, while the mortality of the cases treated by expectation was only 19.5 per cent. and that of the amputations 25.1. The results of this operation performed in the European wars were even less satisfactory, as will be seen from the appended table:

TABLE XCIV.

Results of Excisions at the Ankle Joint on the Occasions named and from the Authorities quoted.

ACTION, ETC.	Cases.	Recoveries.	Deaths.	Undetermin'd Results.	Percentage of Mortality.
Crimean War, 1854–'57 (MATTHEW,[1] LANGENBECK[2])	2	2			
Italian War, 1859 (NEUDÖRFER[3])	1	1

Aggregates	150	96	49	5	33.7

Considering the remote results in the twenty-two cases of recovery after excision at the ankle of the American civil war, we find that in three instances the operation was fol-

[1] MATTHEW (T. P.) (*Med. and Surg. Hist. of the British Army which served in Turkey and the Crimea, etc.*, London, 1858, Vol. II, pp. 368, 379): successful excision of lower end of fibula. [2] LANGENBECK (B. v.) (*Ueber die Schussfracturen der Gelenke und ihre Behandlung*, Berlin, 1868, p. 46): v. Kwicinsky, Russian Lieutenant General, wounded at the Alma, Sept. 20, 1854, in left ankle; subperiosteal excision of internal malleolus and astragalus, May 30, 1859, by VON LANGENBECK; recovery without shortening; anchylosis of joint. [3] NEUDÖRFER (J.) (*Die Endresultate der Gelenkresektionen*, in *Wiener Med. Presse*, 1871, S. 405): A. Winkler, shot fracture of right ankle joint, Solferino, June 24, 1859; secondary excision of the ankle joint by NEUDÖRFER; excellent recovery. [4] LANGENBECK (B. v.) (*Ueber Resection des Fussgelenks bei Schussfracturen desselben, nebst Vorstellung eines Falles von subperiostaler Resection der Diaphyse der Tibia und Fibula*, in *Berliner Klinische Wochenschrift*, 1865, S. 30) performed 5 excisions of the ankle joint in the Schleswig-Holstein War of 1864: Werkmeister, Tambour, Düppel, March 28, 1864; fracture of left internal malleolus and astragalus; May 1, 1864, subperiosteal excision of ankle joint; recovery, with useful limb; joint anchylosed. F. Holcke, 7th Brandenburg Reg't, No. 60, April 18, 1864, before Düppel; shot fracture of lower portions of tibia and fibula; excision May 3, 1864; death May 14, of pyæmia. Lieut. C. F. Leth, 3d Infantry, Alsen, June 29, 1864, shot fracture of both malleoli of right foot; excision July 29; recovery, with useful limb. Lieut. Wedell-Jarlsberg, Alsen, June 29, 1864; shot fracture right ankle joint; Aug. 19, subperiosteal excision of lower portion of tibia and part of astragalus; recovery. Groen, 5th Danish Regiment, Alsen, June 29, 1864; shot fracture of left ankle joint; July 15, subperiosteal excision of tibia, fibula, and astragalus; recovery, with useful limb. [5] NEUDÖRFER (J.) (*Aus dem feldärztlichen Berichte über die Verwundeten in Schleswig*, in *Archiv für Klinische Chirurgie*, Berlin, 1865, B. VI, p. 559) excised the lower portions of the tibia and fibula and the head of the astragalus; the patient recovered with one inch shortening and good use of the limb. (See also *Berliner Klinische Wochenschrift*, 1865, S. 31.) [6] NEUDÖRFER (J.) (*Die Endresultate der Gelenkresektionen*, in *Wiener Med. Presse*, 1871, p. 406) excised the ankle joint on May 15, 1865, in the case of J. Kuzelik, wounded at Sayaltepek, April 25, 1865; recovery in five months, with good use of foot. Dr. NEUDÖRFER (*Handbuch der Kriegschirurgie und der Operationslehre*, Leipzig, 1872, Zweite Hälfte, Spec. Theil, Zweite Abth. S. 1603) remarks: "I have performed this resection after shot wounds 14 times, and of these 14 cases I have lost only 2; all the rest recovered with perfectly useful feet." With the exception of the 3 cases referred to above, the editor has not been able to identify the operations claimed to have been performed by Dr. NEUDÖRFER. [7] BECK (B.) (*Kriegs-Chirurgische Erfahrungen während des Feldzuges* 1866, *in Süddeutschland*, Freiburg, I. Br., 1867, S. 354): L. Finkbeiner, 2d Würtemberg Infantry, Tauberbischoffsheim, July 24, 1866, through both ankle joints; July 28, excision, by Professor v. BRUNS, of right ankle joint; both joint surfaces were removed; fatal. [8] LAUFFS (LAURENZ) (*Zur Statistik der Fussgelenkresektionen*, Inaug. Diss., Halle, 1872, p. 36): C. Rochhardt, Lieut., 1st Austrian Inf., Trautenau, June 27, 1866, shot wound left ankle joint; August 16, resection of ends of tibia and fibula and upper surface of astragalus by Prof. VOLKMANN; recovery; shortening 1½ inches; walks well with a cane. [9] STROMEYER (L.) (*Erfahrungen über Schusswunden im Jahre* 1866, Hannover, 1867, p. 60): C. Weidemann, 3d Hannoverian Infantry, shot in left ankle joint; July 10, excision of 1½ inches of tibia and fibula and upper part of astragalus by Dr. STROMEYER; ball extracted; July 18, removal of remaining portion of astragalus; May 21, 1867, amputation upper third of leg; recovery in 4 weeks. [10] LANGENBECK (B. v.) (*Ueber die Schussfracturen der Gelenke, etc.*, Berlin, 1868, p. 47, No. 10): C. Staudinger, 1st Thüringen Inf., No. 31, Königgrätz, July 3, 1866; shell wound of right ankle joint; July 31, excision of internal malleolus and joint surface of astragalus by Prof. v. LANGENBECK; recovery, with 2 centimetres shortening; walks well with an ordinary shoe. LANGENBECK (B. v.) (*loc. cit.*, p. 47, No. 11): J. E. H. Pfitzner, 1st Silesian, No. 46, Nachod, June 27, 1866; shell fracture of lower third of leg; resection of internal malleolus

lowed by secondary amputation, and that in at least nine instances the joint remained painful and swollen, compelling the patients to use crutches or canes for support, and unfitting them for manual labor; in several instances the wounds reopened, abscesses formed many years after the injury, deficient circulation and varicose veins followed, and in one case the continued irritation finally extended into the knee joint. In regard to this operation

---

August 7, by v. LANGENBECK; shortening 8–9 centimetres; uses a crutch. (See also GURLT (E.), *Die Gelenk-Resectionen nach Schussverletzungen; ihre Geschichte, Statistik, End-Resultate*, Berlin, 1879, p. 404.) LANGENBECK (B. v.) (*loc. cit.*, p. 47, No. 7): A. Thiel, 1st Austrian Infantry, Königgrätz, July 3, 1866, right ankle joint; July 26, excision of external malleolus and the upper joint surface of the astragalus by Prof. v. LANGENBECK; recovery, with anchylosis. GURLT (E.) (*loc. cit.*, p. 489). LANGENBECK (B. v.) (*loc. cit.*, p. 47, No. 8): M. Wagner, Austrian Infantry Regiment No. 6, Königgrätz, July 3, 1866; shot fracture left ankle joint; July 26, subperiosteal resection of tibia, fibula, and upper surface of astragalus by Prof. VON LANGENBECK; death August 6. GURLT (E.) (*loc. cit.*, p. 493). LANGENBECK (B. v.) (*loc. cit.*, p. 47, No. 9): Bissig, train-captain, Austrian Infantry No. 55, Königgrätz, July 3, 1866; shot in right astragalus; July 26, excision of lower portion of internal malleolus and of astragalus by VON LANGENBECK; gangrene; death. GURLT (E.) (*loc. cit.*, p. 493). [11]GURLT (E.) (*Die Gelenk-Resectionen nach Schussverletzungen, u. s. w.*, Berlin, 1879, p. 400): R. Witt, Kaiser Alexander Garde-Gren. Reg't, Königgrätz, July 3, 1866; shot fracture left ankle joint; August 20, excision of external malleolus and portion of astragalus by Dr. WAGNER; bony anchylosis; 6 centimetres shortening; walks short distances comfortably, sometimes even without a cane. GURLT (E.) (*loc. cit.*, p. 401): A. Streese, Kaiser Alexander Garde-Gren. Reg't, Königgrätz, July 3, 1866; shot fracture of right ankle joint; August 31, excision of both malleoli and talus by Dr. WAGNER; recovery, with 2½ inches shortening; new formation of bone; able to walk a mile with the use of a cane. GURLT (E.) (*loc. cit.*, p. 402): Jacob Raecke, 1st Magdeburg Reg't, No. 26, Königgrätz, July 3, 1866; left ankle joint; August 17, excision of 1 inch of tibia and fibula and joint surface of astragalus by Dr. SPIERING; recovery; walks with apparatus. GURLT (E.) (*loc. cit.*, p. 405): A. Griczka, 7 Pomm. No. 54, Trautenau, June 27; shell wound of left ankle joint; September 19, joint surface of tibia excised and necrosed portions of astragalus removed; recovered; walks on crutches and with a high heel; shortening 6 centimetres. GURLT (E.) (*loc. cit.*, p. 406): A. Bauske, 8th Pommeranian Reg't, No. 61; shrapnel shot, July 3, 1866, at Königgrätz, in left ankle; July 29, excision of lower extremities of tibia and fibula and upper part of astragalus by Dr. BUSCH; recovery, with 9 centimetres shortening; anchylosis; walks with a crutch. GURLT (E.) (*loc. cit.*, p. 445): H. Morgenstern, 6th Saxon Infantry, Königgrätz, July 3, 1866; shot wound of left ankle joint; July 28, excision of lower ends of tibia and fibula and the whole astragalus by Prof. BUSCH; Nov. 21, amputation of leg; recovery. GURLT (E.) (*loc. cit.*, p. 445): G. H. Seifert, 13th Saxon Infantry, Königgrätz, July 3, 1866; shot through right ankle joint; July 29, resection of ends of tibia and fibula by Dr. DIEHL; shortening 10 centimetres; little use of ankle and foot. GURLT (E.) (*loc. cit.*, p. 447): A. Seidel, 12th Saxon Infantry, Königgrätz, July 3, 1866; shot fracture of right leg at the ankle joint; July 26, excision of lower end of tibia and of the astragalus by Dr. BUSCH; death July 31, 1866. GURLT (E.) (*loc. cit.*, p. 489): A. Jano, 2d Austrian Infantry, Königgrätz, July 3, 1866; shell wound of left ankle; August 4, excision of left ankle joint with extirpation of astragalus; recovery. GURLT (E.) *loc. cit.*, p. 490): F. Mistelbauer, 6th Austrian Reg't; shot wound of left ankle joint; resection of left tibia and fibula; Nov. 27, amputation leg; recovery. GURLT (E.) (*loc. cit.*, p. 490): A. Leitgeb, Austrian Infantry Regiment No. 15; Königgrätz, July 3, 1866; right ankle joint; July 27, excision of ends of tibia and fibula and astragalus by Professor BUSCH; recovery, with good use of limb. GURLT (E.) (*loc. cit.*, p. 490): G. Bulsoni, Austrian Inf. Reg't, No. 26, July 3, 1866, Königgrätz; right ankle joint; August 8, excision of the fractured joint surface of the tibia and removal of the fractured external malleolus by Dr. FINCKE; recovery; walks with a cane. GURLT (E.) (*loc. cit.*, p. 490): P. Kanta, 34th Austrian Infantry, Königgrätz, July 3, 1866; left ankle joint; August 3, excision of joint by Dr. HAHN; recovery. GURLT (E.) (*loc. cit.*, p. 490): W. Stelzig, Austrian Infantry No. 42, Königgrätz, July 3, 1866; shot fracture of right ankle joint; July 25, excision of ankle joint by VON LANGENBECK; good recovery. GURLT (E.) (*loc. cit.*, p. 491): J. Bresonelli, 47th Austrian Infantry, Königgrätz, July 3, 1866; comminution of right external malleolus; August 8, excision of end of tibia and upper portion of astragalus by Surgeon FINCKE; Sept. 3, amputation of leg in upper third; recovery. GURLT (E.) (*loc. cit.*, p. 491): A. Diener, 73d Austrian Infantry, Königgrätz, July 3, 1866; ankle joint fractured; Oct. 20, inner surface of external malleolus, portion of astragalus, and part of os calcis removed by Surgeon HECK; recovery, with 4 centimetres shortening; able to walk several miles without pain. GURLT (E.) (*loc. cit.*, p. 492): F. Dubsky, Austrian Jaeger Batt. No. 17; shell wound of outer malleolus of left foot; August 21, excision of 2½ inches of end of tibia by Surgeon GAEHDE; recovery. GURLT (E.) (*loc. cit.*, p. 492): N. Prymak, Austrian Lancers Reg't No. 11, Königgrätz, July 3, 1866; shot fracture lower end of right tibia and fibula; July 28, excision of 2 inches of tibia and fibula by Prof. BUSCH; recovery, with varus position. [12]GURLT (E.) (*loc. cit.*, pp. 611, *et. seq.*) details 99 cases of excisions at the ankle joint from the Franco-Prussian War of 1870–71; the results in 4 cases are not stated; 57 were successful and 38 fatal, a mortality rate of 40 per cent. The operation involved the tibia in 7 (4 recoveries, 2 deaths, 1 unknown result), the fibula in 5 (3 recoveries, 2 deaths), the tibia and astragalus in 7 (2 recoveries, 5 deaths), the fibula and astragalus in 4 (4 recoveries), the tibia and fibula in 22 (14 recoveries, 8 deaths), the tibia, fibula, and astragalus in 38 (24 recoveries, 13 deaths, 1 unknown result), and in 16 instances (6 recoveries, 8 deaths, 2 unknown results) the portions of bone excised were not indicated. In 13 instances, with 11 deaths, amputation was subsequently resorted to. To the 99 cases reported at length by Professor GURLT in his exhaustive work must be added the following 5 cases: [13]BECK (B.) (*Chirurgie der Schussverletzungen*, Freiburg, i. Br., 1872, p. 881): F——, 1 Baden L.-Gr—. Reg't, No. 109; comminuted shot fracture of ankle joint; primary excision; recovery, with anchylosis. BECK (B.) (*loc. cit.*, p. 909): 1 case of resection of internal malleolus; fatal. [14]KRATZ (*Resultate der während des letzten Feldzuges ausgeführten Gelenkresektionen*, in *Deutsche Militair-Aerztliche Zeitschrift*, Berlin, 1871, Jahrg. I, p. 596): Saeckel, Jaeger Bat. No. 11 (Prussians); shot fracture left ankle joint; excision of lower portions of both bones of leg; shortening 2½ inches, with œdematous swelling; atrophy of muscles from knee downwards; active movements of foot weak. [15]GOLTDAMMER (*Bericht über die Thätigkeit des Reserve-Lazaretts des Berliner Hilfsvereins in der Garde-Ulanen-Kaserne zu Moabit*, in *Berliner Klinische Wochenschrift*, 1871, Jahrg. VIII, p. 151): Leclerc, 1st French Engineers, wounded at Wörth, August 6, 1870, in left ankle; Sept. 13, excision of astragalus, os calcis, and os naviculare; recovery, with good use of foot. [16]COUSIN (A.) (*Histoire Chirurgicale de l'ambulance de l'Ecole des Ponts et Chaussées*, in *L'Union Médicale*, 1872, T. XIII, p. 159): Soldier, 110th French line, shot fracture of lower ends of tibia and fibula, November 29, 1870; December, hæmorrhage from peroneal, which was ligated; excision of lower ends of tibia and fibula; pyæmia; death December 25, 1870. (GORDON, *Lessons on Hygiene and Surgery from the Franco-Prussian War*, London, 1873, p. 167.) [17]*Société Ottomane de secours aux blessés et malades militaires constituée d'après la Convention de Genève*, Vol. III, *Ambulances fixes et mobiles du Croissant rouge*, Constantinople, 1878, p. 39, and GURLT (E.) (*loc. cit.*, p. 1153): At the hospital at Beylerbey, under the charge of Dr. BALDRIAN; Mehmet, shot wound of ankle joint; resection; death from anæmia. [18]STEINER (F.) (*Aus dem Tagebuche eines deutschen Arztes während der Zeit des Krieges im Oriente* 1876, in *Wiener Med. Wochenschrift*, 1877, No. 18, p. 426): K. N., aged 29, shell fracture left ankle joint, middle of August, 1876; September 1, excision of 4 inches of fibula; doing well in three weeks. [19]REYHER (CARL) (*Die antiseptische Wundbehandlung in der Kriegschirurgie*, in R. VOLKMANN'S *Sammlung Klinischer Vorträge*, Nos. 142, 143, Leipzig, 1878, pp. 1219 and 1234) tabulates 6 cases (4 recoveries, 2 deaths) of excisions at the ankle joint treated at the Barrack hospital at Swilainatz, but gives no details. The 2 fatal cases are related by G. TILING in his *Bericht über 124 im serbisch-türkischen Kriege im Baracken-Lazareth des Dorpater Sanitäts-Trains zu Swilainatz behandelte Schussverletzungen*, Dorpat, 1877, pp. 76 and 81: St. Petkowitsch, aged 18, shot fracture of right internal malleolus August 20, 1876; excision of ends of tibia and fibula; September 2, amputation at knee joint; September 7, secondary hæmorrhage and death. O. Uroschewitsch, aged 28, shot fracture of astragalus and os calcis; ankle joint opened; wound received a few days before September 21, 1876; September 21, excision of the astragalus and entire os calcis; September 25, amputation at ankle joint; gangrene; death September 30, 1876. [20]Dr. TILING (*loc. cit.*, p. 80) reports a third fatal case, not included in Dr. REYHER'S statistics: G. Konstantinowitsch, aged 56, shot wound of left ankle joint, received in the early part of September, 1876; October 11, excision of articular extremities of tibia and fibula and astragalus; death October 20, 1876. [21]GURLT (E.) (*loc. cit.*, p. 1154) tabulates a successful case of excision at the ankle joint observed by Dr. WAHL at the hospital at Sistowa; no particulars are given.

it is therefore only necessary to reiterate the opinion expressed in the preliminary report,[1] that while the "judicious use of the gouge and bone forceps are admissible in gunshot wounds of the ankle joint, the formal excisions are rarely successful."[2] Recoveries with useful limbs have been claimed for this operation in some instances during the Franco-Prussian War, 1870–71, and later, under antiseptic treatment, in the Russo-Turkish War, 1876–77,[3] but hardly sufficient time has elapsed to judge of the remote effects of the operations performed during these campaigns.

Amputations at the Ankle Joint.—Amputation at the ankle joint for disease had been frequently performed since the middle of the last century[4] in civil practice, but the operation seems not to have been performed for shot injury until about the middle of the present century, during the Schleswig-Holstein War, 1848–1850, in which four exarticulations at the ankle are recorded by Professor Stromeyer. That it was not regarded with favor by surgeons of the late civil war is evident from the limited number of cases in which it was performed; and, although the number of operations recorded has increased from sixty-seven cases reported in the preliminary report from the Surgeon General's Office in 1865,[5] to one hundred and sixty-one cases reported here, yet the proportion of exarticulations at the ankle joint to the cases of fractures remains very small when compared with the number of amputations in the leg following similar injuries. Of the seven thousand five hundred and forty-three shot fractures of the bones of the foot and ankle joint recorded during the war, one thousand six hundred and twelve, or 21.3 per cent., were followed by amputation in the leg, while only one hundred and sixty-one, or 2.1 per cent., were disarticulated at the ankle joint. The operation seems to have been selected by the few surgeons who performed it as an "operation of expediency," with a view of falling back, in case of necessity, upon amputation in the leg as a "*dernier ressort.*"[6] It may be assumed, therefore, that only the cases most favorable to such an operation were selected for its performance. As far as the mortality rate is concerned, the exarticulation at the joint would seem to have been followed by less loss of life than the amputations in the leg—the fatality rate of the former being 25.1,[7] of the latter 32.9 per cent.; but of the one hundred and sixty-one exarticulations at the ankle, twenty-nine, or 18.0 per cent., required reamputation, while of five thousand four hundred and fifty-two amputations in the leg, in only two hundred and twenty-one, or 4.0 per cent., reamputation became necessary.

---

[1] *Circular* No. 6, War Department, Surgeon General's Office, Washington, Nov. 1, 1865. *Reports on the Extent and Nature of the Materials available for the preparation of a Medical and Surgical History of the Rebellion.*

[2] Surgeon D. PRINCE, U. S. V., in his *Notes on Surgical Cases and operations at Harrison's Landing, Va.*, August 12, 1862, Surg. General's Office, Div. of Surg. Rec., *File A*, No. 132, remarks: "Any injury requiring a complete exsection of the tibio-astragalean articulation would be almost certain to make amputation a more suitable remedy on account of the thinness of the stratum of soft parts covering the bones." HAMILTON (F. H.) (*A Practical Treatise on Fractures and Dislocations*, 5th ed., Philadelphia, 1875, p. 513): "Resections at the ankle joint are much more hazardous than amputations, and scarcely to be preferred, in army practice, to attempts to save the foot without surgical interference." AGNEW (D. H.) (*The Principles and Practice of Surgery*, Philadelphia, 1878, Vol. I, p. 254): "Amputation either through the joint, or above in the continuity of the limb, is a much more successful operation than excision, which fact of itself should determine our course where the articulating extremities of the bones are comminuted." SÉDILLOT (*Du traitement des fractures des membres par armes de guerre*, in *Arch. Gén. de Méd.*, 1871, T. XVII, p. 457): "Nous la croyons contre-indiquée par l'étendue des surfaces osseuses la présence des nombreux tendons périarticulaires, le volume et la position superficielle des os, la difficulté de la contention de la jambe et du pied, et le danger des complications. Nous maintenons cependant nos appréciations sur les avantages de la résection des malléoles."

[3] GROSSHEIM, *Ueber die Schussverletzungen des Fussgelenks während des letzten Krieges und die Resultate ihrer Behandlung unter Benutzung officieller Quellen*, in *Deutsche Militairärztliche Zeitschrift*, 1876, Jahrgang V, p. 227, *et seq.*

[4] The first authentic example of this operation is recorded by BRASDOR (*Essai sur les Amputations dans les Articles*, in *Mém. de l'Acad. Roy. de Chir.*, Paris, 1774, T. V, p. 771): The foot of a child, 10 years of age, became mortified from some external cause. M. SEDILIER, surgeon at Laval, amputated through the ankle joint. The patient apparently suffered little from the operation; there was little inflammation or suppuration; a sound stump ensued, which never reopened during the twelve years which the patient survived the operation.

[5] *Circular* No. 6, War Department, Surgeon General's Office, Washington, November 1, 1865. *Reports on the Extent and Nature of the Materials available for the preparation of a Medical and Surgical History of the Rebellion.*

[6] SMITH (S.), *Amputations at the Ankle Joint in Military Surgery*, in *U. S. Sanitary Com. Memoirs*, Surgical Volume II, New York, 1871, p. 102.

[7] In *Circular* No. 6, War Dep't, Surg. General's Office, November 1, 1865, p. 45, the number of exarticulations at the ankle joint was stated as 67; 58 recovered and 9 were fatal, a fatality of 13.4 per cent. This mortality rate was ascertained from partial returns, and it was stated at the time that the records were far from complete. The full returns have augmented the mortality rate to 25.1 per cent., as shown in TABLE LXXXIX, p. 595, *ante*.

The operations most generally preferred were those of Syme and Pirogoff, but in a few instances the malleoli and the articular surface of the tibia were retained, and in others the malleoli were removed while the articular surface of the tibia was left intact and the bone covered with a dorsal flap. In Syme's operation (FIG. 354) the malleoli and from one-half to one and a half inches of the surface of the tibia were removed; in Pirogoff's operation (FIG. 355) the os calcis was sawn through and its cut surface placed in apposition to the sawn ends of the tibia and fibula. In both operations the heel flap was used. The advantages claimed for the Pirogoff operation would seem to be a gain in the length of the stump and the preservation of the heel cushion in its natural condition attached to the os calcis, thus insuring a stump capable of readily sustaining the weight of the body. The latter advantage cannot be denied, provided a firm union of the cut surfaces of the os calcis and the tibia and fibula can be obtained; the additional length of the limb may be considered a substantial gain in unaided locomotion, but in the application of an artificial limb the Syme stump offers the best facilities, the base of support being on the same plane as the natural ankle joint, while, in the Pirogoff stump, the base is necessarily on a much lower plane than that of the sound limb, allowing no space for the play of an artificial joint. The few surgeons who recorded their views on the relative value of the Syme and Pirogoff operations have expressed themselves in favor of Syme's operation. Surgeon J. Wilson Wishart, in a letter to the Surgeon General dated May 1, 1866, states: "If called upon to choose in a given case, I should prefer Syme's to Pirogoff's." In a letter to this Office, in 1869, Surgeon C. S. Wood, who had performed Pirogoff's operation on several occasions, states that he had so much trouble in preventing displacement of the parts to be united that afterwards he always gave Syme's operation the preference.

FIG. 354.—SYME'S amputation at the ankle. [After ESMARCH.]

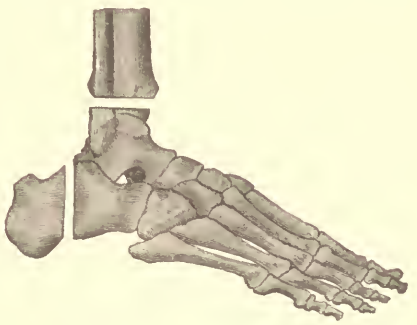

FIG. 355.—PIROGOFF'S amputation at the ankle. [After ESMARCH.]

To what extent union of the cut surfaces of the os calcis and of the tibia and fibula has taken place in the cases of recovery after Pirogoff's operation, and whether the union was osseous or only ligamentous, could not be positively ascertained. Of three cases in which the limb was subsequently amputated in the leg, the bony portions removed at the second operations are preserved in the Army Medical Museum. In two of these cases (Captain Denniston, CASE 875, p. 598, *ante*, and Private Loughlin, CASE 884, p. 604, *ante*) there were no indications whatever of union after two and three weeks; in the third case (Private Larkin, 48th New York, CASE 795, p. 545, *ante*) the patient was discharged cured on December 4, 1863, four months and nine days after the operation; but when seen some weeks after his discharge by Dr. E. D. Hudson, to whom he had applied for an artificial limb, the tibia was already extensively necrosed and the leg was enlarged one-third beyond the normal size. The patient led a life of suffering for fifteen and a half years, until re-amputation was performed in May, 1879. In this case union of bone had taken place, as shown in the specimen (No. 6913 *Surg. Sect.*, A. M. M.) represented in the wood-cut, FIG. 32, on page 545. As far as is indicated by the recorded cases, cure followed more speedily after Pirogoff's than after Syme's operation; in twenty-five cases of the former the average time was 2.8, in forty-seven of the latter 3.7 months.

Judging from the cases before us, the risk of life, in military surgery at least, is somewhat greater in Pirogoff's than in Syme's operation. Of the eighty-three operations after Syme in the American civil war, the result was not determined in one case, sixty-one were followed by recovery, twenty-one by death, a mortality of 25.6 per cent.; while of forty-nine operations after Pirogoff, thirty-five were successful and fourteen fatal, a fatality of 28.5 per cent. A similar result has been obtained from the cases collected in European and other campaigns, grouped in the following table:

TABLE XCIV.

Results of Amputations at the Ankle Joint on the Occasions named and from the Authorities quoted.

Of fourteen operations after Syme with determined results, three, or 21.4 per cent., were fatal, and of eighteen after Pirogoff, five, or 27.7 per cent., had fatal terminations.

[1] STROMEYER (L.) (*Maximen der Kriegsheilkunst*, Hannover, 1855, p. 756) tabulates 4 amputations at the ankle joint by SYME'S method during the Schleswig-Holstein War, 1848–50; 2 were successful and 2 fatal. [2] DJÖRUP (*Bemærkninger over de i Krigen* 1848–50 *foretagne Amputationer i Forbindelse med en Statistik over dem*, in *Hospitals-Meddelelser*. Kjöbenhavn. 1852. B. V, p. 107) reports 3 exarticulations at the ankle joint in the Danish army during the war of 1848–50; 2 were successful, 1 fatal; no details are given. [3] MATTHEW (T. P.) (*Med. and Surg. Hist. of the British Army in the years* 1854-55-56, London, 1858, Vol. II, pp. 372, 373) tabulates 13 cases of exarticulation at the ankle joint; 11 of the patients survived and 2 died. Details of two of the cases are given by GUTHRIE and STANLEY. GUTHRIE (G. J.) (*Commentaries on the Surgery of the Peninsular War*, London, sixth ed., 1855, p. 99): British soldier in the Crimea; round ball lodged against the astragalus but was not removed; inflammation extended into the ankle joint; flap amputation at the ankle joint and subsequent amputation in thigh; recovery. STANLEY (*Result of Syme's Operation of Amputation at the Ankle Joint*, in *The Lancet*, London, 1857, Vol. II, p. 472): A sailor had his foot shattered by an explosion of a shell before Sebastopol, in April, 1857; SYME'S amputation at the ankle joint by a Russian surgeon; October 31, amputation in lower third of leg for painful stump; probably recovered. [4] CHENU (J.-C.) (*Rapport, etc., de Campagne d'Orient en* 1854–55–56, Paris, 1865, p. 473) records 50 cases of exarticulation at the ankle joint; 35 terminated successfully and 15 fatally; and on pp. 474, 475, gives brief details of the successful operations. Two fatal cases are cited by ARONSSHON and SALLERON. ARONSSHON (*Obs. d'un cas d'amputation tibio-tarsienne procédé* PIROGOFF, in *Rec. de Mém. de Méd. de Chir. et de Phar. Mil.*, Paris, 1856, 2me sér., T. XVII, p. 369): J. Sch—; shot wound of right metatarsus June 13, 1855, at Sebastopol; PIROGOFF'S operation by ARONSSHON June 18; gangrene; death July 2. SALLERON (*Compte-Rendu des Amputations Primitives et des Amputations consécutives*, in *Rec. de Mém. de Méd. de Chir. et de Phar. Mil.*, Paris, 1858, 2me sér., T. XXII. p. 317): Cornand, 20th line regiment, received July 10, 1855, a shot fracture of the three first metatarsal bones of left foot; amputation at the ankle joint July 30, 1855; gangrene; death. [5] HÜBBENET (C. v.) (*Die Sanitäts-Verhültnisse der Russischen Verwundeten, etc., in den Jahren* 1854–56, Berlin, 1871, p. 182) tabulates 57 amputations at the ankle joint; the results were ascertained in only 13 cases; 9 were successful, 4 fatal. One of the successful cases is detailed by LEGOUEST (*Amp. de la partie inférieure de la jambe dans la région intra-malléolaire*, in *Gaz. des Hôp.*, 1855, No. 150, p. 597): Russian prisoner G. Gardey, 6th Infantry; shot fracture of right tarsal bones at the Alma, September 20, 1854; SYME'S operation October 3, 1854; nearly healed in one month; marched well in 3 months. [6] HEYFELDER (J. F.) (*Die Verwundungen und Operationen in Folge des Bombardements von Sveaborg vom* 9–11 *Aug.*, in *Deutsche Klinik*, 1855, B. VII. p. 531): Officer's servant of the ship "Russland;" shot wounds of right shoulder and left foot and contusion of chest; exarticulation of right arm and left foot, the latter by BAUDEN'S method; died one hour after the operation. IDEM (*loc. cit.*, p. 554): W. Kolomagin, sailor, aged 22; shell wound of right foot August 9, 1855; August 25, amputation at ankle joint by a modification of SYME'S operation; pyæmia, and death September 1, 1855. [7] WILLIAMSON (G.) (*Military Surgery*, London, 1863, p. 214) relates a successful case of amputation at the ankle joint during the mutiny in India in 1857, in a man of the 75th regiment; a very good stump resulted. [8] E. P——, aged 29, accidental shot wound of left foot May 16, 1858; integuments and muscles of the sole of the foot ploughed up except at the heel; the metatarsals fractured; PIROGOFF'S amputation at the ankle performed by Dr. MASH on the same day; recovery, with a useful stump (J. F. GRAY, in the *Medical Times and Gazette*, London, 1860, Vol.

Considering the number of re-amputations after Syme's and Pirogoff's operations, Pirogoff's method would seem to be the more successful. Of eighty-three cases of Syme's amputation, twenty, or 24.0 per cent.. submitted to re-amputation; of forty-nine Pirogoff's operations, eight, or 16.3 per cent., were subjected to re-amputation. Sloughing of the flaps seems to have been the most frequent cause of the re-amputation after Syme's operation, this complication having been given as the cause in twelve of the twenty re-amputations; tender stump is given in one case, and necrosis in another; in six the cause was not stated. In the eight re-amputations after Pirogoff's operation necrosis and caries are stated as the cause in two, sloughing in four, gangrene in one, and secondary hæmorrhage in one instance. Deducting the cases in which re-amputations were performed there remain forty-six recoveries after Syme's and thirty after Pirogoff's operation. In sixteen of the forty-six opera-

II, p. 9). [9] CORNAZ (*Amputation tibio-tarsienne d'après le procédé de* PIROGOFF, in *Écho Médical*, Sept. 10, 1861, p. 428): J. F. D——; accidental shot wound of left foot, involving tarsus and metatarsus; PIROFOFF'S amputation performed the same day by Dr. CORNAZ; recovery in about 2 months, with union of sawn surfaces and good use of stump. [10] CHENU (J.-C.) (*Statistique Méd. Chir. de la Campagne d'Italie en* 1859 *et* 1860, Vol. II, p. 823) tabulates 9 disarticulations at the ankle joint, 4 successful, 5 fatal, and gives some details of the 4 successful operations: L. J. Boyer, sergeant, 55th line; shot fracture of right metatarsus. Solferino, June 24, 1859; amputation at ankle joint by Dr. ARLAUD, after September 28; the malleoli were removed October 8; December 10, recovery. J. Gros, 86th Infantry; shot fracture of left tarsus, Solferino, June 24, 1859; amputation at the ankle joint by Dr. J. ROUX, Aug. 18, 1859; recovery. X. Hecht, 9th Artillery; shot fracture of right foot, at Solferino; disarticulation at ankle joint; recovery. L. J. Paviot, 86th Infantry; shot fracture of right calcaneum, Solferino, June 24, 1859; amputation at the joint; recovery. [11] HEINE (C.) (*Die Schussverletzungen der Unteren Extremitäten*, Berlin, 1866, p. 338) and OCHWADT (A.) (*Kriegschirurgische Erfahrungen*, Berlin, 1865, *Appended Table of Operations*, p. XIII, Case 54): Private Chr. L——, 3d Danish Infantry; shot fracture of right astragalus and os calcis, April 18, 1864; PIROGOFF'S operation was attempted on May 4, but the os calcis being found fissured the operation was finished according to SYME'S method by Dr. FISCHER; ½ inch of the epiphysis of the tibia was removed; several necrosed fragments of the tibia came away; recovery, with a poor stump. In a case at a hospital at Ulderup, Staffsurgeon ABEL performed PIROGOFF'S operation (HEINE, *loc. cit.*, p. 339, and LÜCKE (A.) (*Kriegschir. Aphorismen in* LANGENBECK'S *Archiv für Klin. Chir.*, Berlin, 1866, B. VII, p. 19): P. Schlott, 3d Danish Infantry, wounded at Düppell, April 18, 1864; shot fracture of tarsal and metatarsal bones; PIROGOFF'S amputation at ankle joint by Dr. ABEL; pyæmia and gangrene; death May 10, 1864. NEUDÖRFER (J.) (*Aus dem feldärztlichen Berichte über die Verwundeten in Schleswig*, in LANGENBECK'S *Archiv für Klin. Chir.*, 1865, B. VI, p. 544): J. Brandner, 9th Chasseurs, at Oeversee, Feb. 6, 1864, received a shot fracture of the right astralagus and internal malleolus; February 24, PIROGOFF'S amputation at the ankle performed by Dr. NEUDÖRFER; April 12, union of os calcis and tibia; May 20, stump healed; patient able to walk on the stump without pain. NEUDÖRFER (*loc. cit.*, p. 558) tabulates a second case of amputation after PIROGOFF, but gives no details or result. [12] FISCHER (K.) (*Militairärztliche Skizzen aus Süddeutschland und Böhmen*, Aarau, 1867, p. 99) refers to 2 operations after SYME and 3 after PIROGOFF, performed during the Austro-Prussian War, 1866; the results are doubtful. [13] OTIS (G. A.) (*Circular* No. 3, War Dep't., S. G. O., Washington, 1871: *A Report of Surgical Cases treated in the Army of the United States from* 1865 to 1871); pp. 193, 194): H. G. Nims, additional paymaster, admitted into post hospital, Fort Vancouver, Washington Territory, Dec. 25, 1866, with shot fracture and comminution of external and middle cuneiform bones of right foot; Dec. 28, PIROGOFF'S amputation at ankle joint by Assistant Surgeon J. E. SEMPLE, U. S. A.; recovered. Private P. Vandel, A. 3d Infantry, accidentally wounded Nov. 5, 1867; conoidal ball shattered left os calcis and injured astragalus; SYME'S amputation at ankle joint by Assistant Surgeon A. D. WILSON, U. S. A.; recovered. [14] CHENU J.-C.) (*Aperçu hist. stat. et clin., etc., pendant la guerre de* 1870–71, T. I, p. 493) tabulates 105 instances of amputation at the ankle joint; 17 recovered and 88 proved fatal; and gives details of a few cases of recovery: T. II, p. 31, P. P. F. Chambon, aged 26, 14th Provisionary regiment; shot fracture of left foot, May 26, Paris; amputation at ankle joint; pensioner; p. 55, L. L. Faivre, 7th Artillery, aged 36; shell fracture of left foot, Monthéliard, January 15, 1871; amputation at ankle joint; pensioner; p. 74, Havart (C. J. M.), 12th Infantry, aged 27; comminuted shot fracture of left foot, received at Saint-Privat; amputation at ankle joint; pensioner; p. 75, Hermier (C. A.), 3d Zouaves, aged 33; shell fracture of left foot; amputation at ankle joint; pensioner; p. 99, Mangin (P. G. A.), Captain, 24th Infantry, aged 31; shell wound of left tarsal bones, received at Bapaume; amputation at ankle joint; pensioner; p. 100, A. Marchand-Liffoz, 64th Infantry, aged 28; shot wound of left foot, Sedan; exarticulation at ankle joint; pensioner. Other cases are given in detail by SÉDILLOT (*Du traitement des fractures des membres par armes de guerre*, in *Arch. Gén. de Méd.*, 1871, VI[e] sér., T. XVII, p. 458): Louis Charlier, 48th Infantry, aged 21; shell wound of foot. Woerth, August 6; PIROGOFF'S amputation on the day after the injury by M. SARAZIN; partial gangrene of stump; recovery; walks well; no consolidation (CHENU, *Aperçu hist. stat. et clin., etc.*, Paris, 1874, T. II, p. 32); Jean Barjet, 9th Cuirassiers, aged 26; shot fracture of right tarsus and metatarsus, Reichshofen, August 6, 1870; PIROGOFF'S operation, August 19, 1870, by M. JOESSEL; abscess; doing well at the end of September; os calcis movable (CHENU, *loc. cit.*, p. 8); François Berga, sergeant, 50th Infantry, aged 33; fracture of left tarsal bones, Woerth, Aug. 6, 1870; PIROGOFF'S amputation performed August 7, by M. JOESSEL; abscess; wound healed September 27; os calcis movable (CHENU, *loc. cit.*, p. 13). [15] BECK (B.) (*Chir. der Schussverletz.*, 1872, p. 838, *et seq.*) details five cases of amputation at the ankle joint; one by SYME'S and four by PIROGOFF'S method: F——, 14th Prussian L. W. regiment; shell wound of right tarsal bones; SYME'S amputation at the ankle joint; recovery. D——, 14th L. W. regiment; severe shot injury of foot, at Strassburg; PIROGOFF'S amputation; good recovery. P——, 14th L. W. regiment; shell comminution of tarsal bones; PIROGOFF'S operation; gangrene; septicæmia; death. S——, Baden Artillery regiment No. 14; shot wound of tarsal bones, January 16, 1871; PIROGOFF'S operation; patient discharged in September, 1871; result of operation very favorable. G——, 7th L. W. regiment; wounded February 9, 1871; PIROGOFF'S amputation at ankle; pyæmia; death 8 days after the operation. FISCHER (G.) (*Dorf Floing und Schloss Versailles*, in *Deutsche Zeitschrift für Chirurgie*. Leipzig, 1872. B. I, p. 262), in a case of PIROGOFF'S amputation performed 19 days after the injury, received September 1, 1870, the remaining portion of the os calcis became necrosed and was removed two months after the operation; the patient then recovered in 3½ months. In a case of SYME'S operation extensive granulations and pus formations retarded the recovery 2½ months. GRAF (E.) (*Die Königl Reservelazarethe zu Düsseldorf*, Elberfeld, 1872, p. 50): H. Riemann, 46th Prussian Infantry; comminution of ankle joint, especially astragalus, August 6, 1870; PIROGOFF'S amputation Aug. 17; death September 11, 1870, from pyæmia. KIRCHNER (C.) (*Aerztlicher Bericht über das Königlich Preussische Feld-Lazareth im Palast zu Versailles*, Erlangen, 1872, p. 89) tabulates a successful amputation after PIROGOFF for shell wound of the tarsal bones, and a successful SYME'S operation for shot fracture of the ankle joint. RUPPRECHT (L.) (*Militairärztliche Erfahrungen während des deutsch-französischen Krieges im Jahre* 1870–71, Würzburg, 1871, p. 86) observed a successful operation by NEUDÖRFER after SYME'S method, at the Bavarian field hospital No. VIII. SCHINZINGER (A.) (*Das Reserve-Lazareth Schwetzingen im Kriege* 1870 *und* 1871, Freiburg, i. Br., 1873, p. 91): Diemenet: shot fracture of left foot, August 18, 1871; comminution of metatarsals; September 2, PIROGOFF'S amputation by Dr. SCHINZINGER; good recovery. A. Glück, 64th Infantry; shot fracture of right ankle joint August 18, 1870; September 14, PIROGOFF'S operation; union of the tibia and os calcis, the latter projecting downward like a shovel; patient cannot walk; February 22, 1871, the remaining portion of the os calcis removed, and ends of tibia and fibula resected; recovery, with useful stump. STOLL (*Bericht aus dem Königlich Württembergischen 4 Feldspital von* 1870–71, in *Deutsche Militairärztliche Zeitschrift*, 1874, Jahrgang III, p. 215): Fahnert, 107th Infantry, shell wound of foot, October 30, 1870: PIROGOFF'S amputation on the day of injury: necrosis of part of the remaining portion of the os calcis; necrosed portions removed; in the summer of 1871 the patient had good use of his leg.

tions after Syme's method the stumps are reported as sound and useful, in ten as simply "healed;" in one case the flaps retracted, in two necrosis is diagnosed, and in three the wounds never healed, abscesses continuing for years; in fourteen the remote conditions are not reported. Of the thirty Pirogoff operations nine are stated to have given good and serviceable limbs, four are reported as "healed," in two the remaining portion of the os calcis is drawn upward, in one caries is reported, in two the retained portions of the os calcis are considered hindrances, in three abscesses continued to form. The conditions of nine of the patients could not be traced beyond the time of their discharge from the service.[1]

To relieve the tension caused by the weight of the flap and the consequent tendency to sloughing so frequently noted, Acting Assistant Surgeon J. E. Janvrin applied a flat padded splint to the anterior surface of the leg, which extended beyond the end of the stump. Adhesive straps were then passed from beneath the leg across the flap and carried over the end of the splint and fastened. These were gradually shortened as the healing process went on.

There seems to have been no foundation for the statement made in the preliminary report,[2] on the authority of Baron von Haurowitz,[3] Surgeon-in-Chief of the Russian Navy (during a visit to this Office in 1865), that Pirogoff had himself abandoned his operation, finding the segment of the os calcis likely to become necrosed. In a letter dated Berlin, March 28, 1866, Professor Pirogoff[4] emphatically denies that he has ever given up this operation, and states that he had not a single case of necrosis of the segment of the os calcis, although he had performed the operation more than sixty times.

[1] SCHEDE (*Ueber partielle Fussamputationen*, in VOLKMANN'S *Sammlung Klinischer Vorträge*, Leipzig, 1874, Nos. 72, 73, pp. 515, 516) remarks: "The difference of the length of the stumps, further, is a very considerable one, and upon this, other authors to the contrary notwithstanding, I would not place too little weight. PIROGOFF himself estimates the length gained by his method at least 1½ inches. According to O. WEBER, the shortening of the leg after PIROGOFF'S operation amounts to 2.8 ctm. in the average, while in SYME'S method the limb loses from 6 to 8 or 9 ctm. Yet the former figure can certainly be still considerably reduced by sawing off the bone obliquely, whereby much more may be preserved, and rotation is rendered easier. Among our patients operated upon there are several on whom no measurable shortening could be shown: as a rule it amounted to about 1 ctm., sometimes to 2, and only once did it rise to 3 ctm. So little shortening, of course, is very easily counterbalanced by a slight dropping of the pelvis. With a PIROGOFF stump the patient can therefore not only walk very well without an artificial apparatus and simply with a somewhat cushioned lace-boot—as our patients learned to do without exception very readily; but in favorable cases not even an elevated shoe was required. But when an American surgeon and inventor of an artificial leg, Dr. HUDSON, rejects PIROGOFF'S operation for the reason that his method results in too long a stump to admit of applying a complicated prothetic apparatus with an artificial ankle joint, and therefore prefers SYME'S cut, one will be inclined, on the same principle, to the views of another American, Dr. BLY, for whom in turn the SYME stump is too long because it is not adaptable to his artificial apparatus, and who, therefore, advises amputations of the leg throughout. We would, therefore, return again to amputation at the point of election as the only alternative, only with this difference, that in this case a greater portion of his limb be sacrificed and his life be put in greater jeopardy, not in his own interest, but in that of the instrument maker." That the patient's life is *not* put in greater jeopardy by the PIROGOFF than by the SYME'S operation has been shown in the statistics of the American as well as the European campaigns above cited. Great stress is laid by SCHEDE upon the increased length of stump, enabling the patient to walk very well with a "somewhat cushioned lace-boot" without the addition of a complicated artificial ankle joint, as required after SYME'S amputation. But in the former case the surface of the stump, acting as a pivot on the cushioned shoe, is exposed to the danger of continued attrition similar to the irritating friction caused by the heel cap of an ill-fitting boot or shoe. In the artificial apparatus the friction is in the joint, and not on the tender surface of the stump, which is securely encased in the parts fitting to the leg. Moreover, the artificial joint will allow an easier and more graceful movement, which, in point of appearance, is quite a desideratum with the young soldier, and which causes no extra expenditure, as the United States government furnishes him, at reasonable periods (every fifth year), with an excellent apparatus. The writer has seen instances in which it was almost impossible to detect the use of an artificial foot with an articulated joint, even after attention had been called to that fact.

[3] Not *Harronwitz*, as erroneously printed in *Circular* No. 6.

[4] "Berlin, 28 March, 1866. Sir: Having read in the *Circular* No. 6, Surgeon General's Office, dated November 1, 1865, page 46, that the Baron von Haurowitz, Surgeon-in-Chief of the Russian Marine, in his recent visit to your office has mentioned that I had myself abandoned *my osteoplastic operation of the foot*, finding the segment of the os calcis likely to become necrosed, I have the honor to state that I have never given up this operation. I had *not one single case* of necrosed segment of the os calcis, though I have made this operation more than sixty times, the results of which I published in my Outlines of General Military Surgery (*Grundzüge der Kriegs Chirurgie*, Leipzig, 1864). With the urgent request that my protest may be made public, I have the honor to be, very respectfully, your obedient servant. N. PIROGOFF."

Section VII.

WOUNDS AND OPERATIONS IN THE FOOT.

According to the plan pursued in the previous sections of this Chapter, the consideration of the wounds of the bones of the foot in this section will be restricted to those inflicted by weapons of war. The cases number five thousand eight hundred and sixty; viz: one bayonet and five thousand eight hundred and fifty-nine shot wounds.

BAYONET WOUNDS OF THE BONES OF THE FOOT.—A solitary case of bayonet injury of the metatarsal bones is reported from the Fairfax Seminary Hospital:

Case 889.—Corporal J. Hough, Co. I, 120th New York, aged 26 years, received a bayonet wound of the left foot on October 10, 1864. He was treated at the Depot Hospital of the Second Corps, at City Point, and subsequently at Fairfax Seminary Hospital. Surgeon D. P. Smith, U. S. V., in charge of the latter, certified that the metatarsal bones were injured and that the patient was returned to duty June 20, 1865, to be mustered out of service. The man has not applied for a pension.

SHOT WOUNDS OF THE BONES OF THE FOOT.—Twenty-seven shot contusions and five thousand eight hundred and thirty-two shot fractures are recorded. Of the former one, and of the latter four hundred and fifty-one proved fatal, a mortality rate of 8.3 per cent. In four hundred and forty cases the results were not ascertained.

SHOT CONTUSIONS OF THE BONES OF THE FOOT.—Of the twenty-seven cases of this group, seventeen are designated as contusions of the tarsals, four of the metatarsals, one of the metatarso-phalangeal articulation, and two of the phalangeal bones. In three instances the part injured was not indicated. Twenty-six of the patients recovered and one died of tetanus.

Case 890.—Lieutenant W. Stribler, Co. B, 63d Colored Troops, aged 27 years, was wounded in the right foot by the accidental discharge of his pistol, on President's Island, January 14, 1865. He was admitted to the Officer's Hospital at Memphis the following day, when the ball, which had lodged against the scaphoid bone, was extracted through an incision one and a half inches in length by Assistant Surgeon S. S. Jessop, U. S. V. Partial anæsthesia was produced by chloroform. At the time of the operation the foot had become somewhat swollen and was very painful, but the patient's physical condition was good. Profuse suppuration followed during the first month, and an abscess formed over the internal malleolus without involving the ankle joint. Cold and warm-water dressings and poultices were used and stimulants were administered. The patient recovered and was mustered out of service May 5, 1865. The history was reported by the operator. Lieutenant Stribler subsequently became a pensioner. On January 26, 1870, he was examined by Dr. W. Jones, of St. Joseph, Missouri, who reported as the results of the injury: "Anchylosis of the ankle joint, with an atrophied and partially contracted condition of the muscles of the foot, causing deformity of a character sufficient to render it very difficult to secure proper appearing covering that can be worn with any degree of comfort. The loss of the use of the ankle joint also greatly interferes with walking and causes his movements to be imperfect and laborious." The pensioner was paid December 4, 1881.

Case 891.—Lieutenant W. C. Hall, Co. K, 136th New York, aged 28 years, was wounded in the right foot, at Resaca, May 15, 1864. From a field hospital of the Twentieth Corps he passed to Nashville, where he entered the Officer's Hospital one week after the reception of the injury. Surgeon J. E. Herbst, U. S. V., described the wound and its result as follows: "The ball passed transversely through the tissues on the plantar aspect, immediately beneath and grazing the under surface of the os calcis. The internal or external plantar nerves, or both, were injured, and no doubt the patient suffered exposure to draughts during his transportation hither. Tetanus in the form of trismus and emprosthotonos ensued on May 24th. The wound was freely incised and cleansed. Purgatives of croton oil were administered, seconded by the use of calomel and opium, the latter

in large quantities with little effect. Chloroform had the effect of relaxing the spasms; but notwithstanding all our endeavors rigidity increased and spasms became more violent until the patient was at last overcome by their intensity. Death occurred on May 26, 1864."

SHOT FRACTURES OF THE BONES OF THE FOOT.—The cases included in this group number five thousand eight hundred and thirty-two (5,832), or only about one-half of the number of shot fractures of the bones of the hand recorded on page 1019 of the *Second Surgical Volume.* In the following table it has been attempted to group the shot injuries of the foot, as far as possible, according to the different bones implicated.

TABLE XCV.

Summary of Five Thousand Eight Hundred and Thirty-two Shot Fractures of the Bones of the Foot.

TREATMENT.	CASES.					TARSAL BONES.			TARSO-METATARSAL ARTICULATION.			METATARSAL BONES.			PHALANGES.			BONES NOT SPECIFIED.

The tarsal bones were implicated in one thousand and forty, the tarso-metatarsal articulation in one hundred and twenty-nine, the metatarsal bones in one thousand six hundred and eighteen, and the phalanges in two thousand and fifty cases; in nine hundred and ninety-five instances the parts injured were not indicated. Three thousand five hundred and sixty were throughout treated by expectation, ninety-seven were followed by excision, and two thousand one hundred and seventy-five by amputation.

SHOT FRACTURES OF THE BONES OF THE FOOT TREATED BY CONSERVATION.—The shot fractures of the foot treated without operative interference numbered three thousand five hundred and sixty; the results in three hundred and fourteen cases were not ascertained. Of the remaining three thousand two hundred and forty-six cases, three thousand one hundred and eleven had successful, and one hundred and thirty-five fatal terminations, a mortality rate

of 4.1 per cent. A few cases will be detailed to indicate the manner of treatment generally pursued, which was similar to that of wounds of the hand discussed on page 1020 of the *Second Surgical Volume.* Shot fractures of the os calcis even when quite extensive healed, as a rule, without difficulty:

CASE 892.—*Shot fracture of the os calcis.*—Sergeant D. M. Tarrance, Co. B, 1st Pennsylvania Cavalry, aged 24 years, was wounded in the right foot, at United States Ford, May 25, 1863, and entered Harewood Hospital, Washington, three weeks afterwards. On September 29th the patient was transferred to Mower Hospital, Philadelphia. Surgeon J. Hopkinson, U. S V., reported: "The patient was wounded by a ball entering outside of the tendo-achillis, passing downward, forward and inward through the os calcis, fracturing the bone, and emerging at the inner margin of the sole of the foot. The heel became very much swollen and painful and pus continued to discharge from both the wound of entrance and exit, all the symptoms of necrosed bone being present. Flaxseed poultices were applied; iron and quinine with wine was administered. On December 1st, another examination having been made, it was decided to cut down and remove the diseased bone, and a crucial incision was made along the internal aspect of the bone, its length parallel with the axis of the bone being three and a half inches, in the opposite direction two and a half inches. The loose pieces were then removed and the necrosed bone was scraped with the gouge, after which the wound was closed with sutures and cold-water dressings were applied. The operation was performed by Acting Assistant Surgeon J. H. Jamar, the patient being in good general condition at the time. He did well afterwards. Small fragments of bone exfoliated and were removed at different intervals. By January 20, 1864, the wound was healing kindly and the patient was allowed to go to his home. About the end of February the wound had healed with the exception of a small point, and the patient dispensed with his crutches and used a cane. He was discharged from service July 8, 1864." Examining Surgeon W. Jewell, of Philadelphia, certified to the injury April 7, 1866, and described the wound as still suppurating. The pensioner was paid March 4, 1871.

CASE 893.—*Shot fractures of scaphoid and cuneiform bones.*—Lieutenant J. Miller, Co. A, 5th Ohio, aged 26 years, was wounded in the left foot, at Cedar Mountain, August 9, 1862. Acting Assistant Surgeon J. A. Murphy, in charge of Third Street Hospital, Cincinnati, reported: "The ball entered between the scaphoid and internal cuneiform bones and passed out one inch below the external malleolus. The patient was sent to Cliffburn Hospital, at Washington, where Assistant Surgeon J. S. Billings, U. S. A., on August 14th enlarged the wound of exit and removed several pieces of bone. The patient remained in said hospital for three months, when he obtained a leave of absence and came to his home (in Cincinnati). He applied for treatment in this hospital in December, 1862, when there was still considerable inflammation in the foot. Poultices and cold-water dressings were ordered until the wounds healed. Five small pieces of bone were removed from both the wound of entrance and exit. He is now (April, 1863) able to flex the foot on the leg and walks with a slight halt." Lieutenant Miller was discharged from service June 11, 1863, and pensioned. The Cincinnati Examining Surgeons have certified to the injury from time to time. In 1877 they added that "the cicatrix is small, healthy, and adherent. There is some flattening of the plantar arch; middle tarsal joint very much impaired; motion of ankle good but limited in range." The pensioner was paid March 4, 1881.

CASE 894.—Private J. A. Lunderman, East Missouri Militia, was wounded in the left foot during a skirmish on March 9, 1863. Acting Assistant Surgeon F. A. Bushey reported: "The wound was caused by a conical pistol ball, which entered at the astragalo-cuboid articulation, comminuted the cuneiform and scaphoid bones, and lodged in the foot. The man entered the General Hospital at Springfield eleven months after the injury, at which time the external wound had healed, but the foot was much swollen; constitutional condition good. On February 10, 1864, Dr. B. A. Barette attempted to extract the ball and made an incision three inches in length along the tibialis anticus muscle, when a quantity of necrosed bone was taken out, but the missile could not be found. Simple dressings were applied after the operation. The patient recovered and was returned to duty March 26, 1864." He is not a pensioner.

CASE 895.—*Shot fracture of os calcis and tarsal bones.*—Private J. Chew, Co. C, 58th Indiana, was wounded in the left foot, at Chickamauga, September 20, 1863. He was conveyed to hospital at Chattanooga, where Surgeon J. T. Woods, 99th Ohio, recorded the following history: "A minié ball entered one inch below the outer malleolus, ranging slightly forward and comminuting the head of the os calcis and tarsal bones. Careful exploration failed to detect the missile. Several spiculæ and one small fragment of lead were removed. On September 26th inflammatory action in the parts had increased and the pain was severe and attended with great restlessness. Irrigation was then applied to the parts and anodynes were freely administered. By September 30th the inflammation was increasing, the pain intense, and several more spiculæ were removed. On October 2d an incision was made from the entrance wound forward and inward, opening into the discolored mass freely, after which several pieces of tarsal bone were removed, also a Belgian musket ball from near the internal cuneiform bone. Irrigation to the foot was continued. Three days afterwards the appearance of the parts was better, the pain had decreased, and an anterior splint was applied, elevating the foot. On November 2d part of the tarsal bone from the inner side of the foot was removed." Several days afterwards the patient was transferred to hospital at Murfreesboro' and subsequently to Evansville, where he was discharged from service November 9, 1864, Acting Assistant Surgeon J. A. Jearicon certifying to the use of the foot being completely destroyed by the wound. There is no record of the man ever having applied for pension.

CASE 896.—*Shot fracture of tarsal bones.*—Private J. Campbell, Co. F, 11th New York, aged 36 years, was wounded and captured at Bull Run July 21, 1861. Surgeon R. B. Bontecou, U. S. V., reported: "He was admitted to Hygeia Hospital at Fort Monroe, from Richmond, October 21, 1861, with gunshot wound of right tarsus. A ball had passed into the foot in front of the ankle joint and came out at the tip of the heel. The patient was in bad condition when he arrived, and the foot was very much swollen and painful, with profuse discharge from several sinuses. The fistulæ were dilated with sponge tents and carious bone was removed. He recovered the use of his foot and went to his home in New York City." The patient was discharged from service February 16, 1862, and pensioned. The New York City Examining Board certified, November 4, 1874:

"The wounds are still open and connect with dead bone; the cicatrices and surrounding tissues are thin, inflamed, and tender; movements of joint limited." In the following year the same board reported that "a portion of the astragalus has been removed. Cicatrices are deep and adherent; wound of exit still open and connecting with dead bone." The pensioner was paid September 4, 1880.

CASE 897.—*Shot fractures of tarsal and metatarsal bones.*—Private J. E. Chase, Co. F, 1st U. S. Sharpshooters, aged 25 years, was wounded in the right foot, fracturing the bones, at Spottsylvania, May 12, 1864. He passed through several hospitals and was ultimately transferred to the Veteran Reserve Corps, December 4, 1864, by reason of the results of the injury. On August 31, 1866, the man was mustered out and pensioned. Dr. E. D. Hudson furnished the following description of the case: "Compound comminuted fractures of the metatarsus and tarsus were caused by three rifle shots, and were followed by extensive necrosis and exfoliation of the metatarsus. The insertion and function of the tibialis anticus, peroneus longus, and extensor muscles are destroyed, the plantar aspect of the foot is turned inward and upward, and the patient rests his leg on the outside of the foot, which is turned down, the extensor muscles failing to make the great toe and other parts hug the ground. The limb is not shortened, but there is soreness and stiffness of the foot and considerable anchylosis of the tarsus. An apparatus was applied to antagonize the flexor muscles of the foot and the extensors of the toes, and to reduce the heel and the foot to a normal position." Examining Surgeon L. Richmond, of Troy, Vermont, certified to the injury as follows: "One ball entered between the lower extremity of the tibia and tendo-achillis on the inner aspect, passed outward and downward, and made its exit near the sole of the foot, severely injuring the os calcis. Another ball passed through the foot, severely injuring the three outer metatarsal bones and the tendons; extensive sloughing followed. The third ball entered on the inner side just about the union of the great toe with its metatarsal bone. * * The pensioner walks partly upon the side of the foot," etc. Examiner J. C. Rutherford subsequently reported that "the foot and leg are atrophied and there is but very little muscle left upon the limb. There is no strength in the ankle. He is obliged to use a mechanical support on the foot and leg to enable him to walk at all."

CASE 898.—Captain M. D. Bearden, Co. D, 6th Tennessee, aged 34 years, was wounded in the left foot, at the Chattahoochee River, July 1, 1864, and was admitted to Lookout Mountain Hospital near Chattanooga eight days afterwards. Surgeon L. D. Harlow, U. S. V., reported: "A conical ball fractured the cuboid bone and lodged in the centre of the foot under the scaphoid bone. The foot became greatly swollen and inflamed, particularly on the inner side, and the patient, who had been a strong and robust man previous to the injury, grew weak, feverish, and irritable. On August 27th an abscess which had formed on the internal surface was opened, and the ball was extracted through the opening. Chloroform was used during the operation. Rapid improvement followed." The patient subsequently entered the Officers' Hospital at Knoxville, where he was mustered out of service April 27, 1865, and pensioned. The Knoxville Examining Board certified to anchylosis resulting from the injury. The Pension Office Examining Board, Washington, D. C., reported the pensioner's condition March 11, 1881, as follows: "This man can do no manual labor. The ankle and leg to the knee are much enlarged, and the lower two-thirds of the tibia and soft parts are much diseased. He has to use crutches at times to walk, and a stout cane at all times. He is very lame, and from the great ulceration of the bone and soft parts must suffer constant pain."

CASE 899.—Private H. West, Co. L, 7th Illinois Cavalry, aged 22 years, was wounded in the left foot, at Colliersville, October 11, 1863. He remained at a field hospital for some weeks and was then conveyed to Memphis, where he entered Adams Hospital November 17th. Surgeon J. G. Keenon, U. S. V., in charge of the latter, reported: "The patient had been wounded by a ball penetrating the scaphoid bone and carrying with it the tongue of the buckle of a spur, which lodged. After a time a sinus formed in the injured foot, connecting with what appeared to be necrosed bone, but which proved to be perfectly healthy. On March 10, 1864, chloroform was administered, and a vertical incision was made about one and a half inches in length and continued along the track of the ball from within outward, after which the tongue of the buckle was found and removed. The operation was performed by Acting Assistant Surgeon S. S. Jessop, the patient being in good physical condition at the time. He did well until March 30th, when hospital gangrene supervened, which was checked by one application of pure bromine." The patient was ultimately discharged from service May 13, 1865, and pensioned. Examining surgeons have certified to "anchylosis and deformity of the foot," etc. The pensioner was paid March 4, 1881.

CASE 900.—*Shot fractures of metatarsal bones.*—Private C. S. Wheelwright, Co. M, 1st New Jersey Cavalry, aged 26 years, was wounded on picket duty near Warrenton, January 31, 1864, and admitted to Douglas Hospital, Washington, the following day. Acting Assistant Surgeon C. Carvallo, reported: "The ball entered the external dorsal aspect of the right foot anterior to the fourth tarso-metatarsal articulation, and emerged posteriorly to the metatarso-phalangeal articulation of the big toe, having fractured the fourth metatarsal bone obliquely and passed beneath the others. Water dressings had been applied before admission and were continued. The foot became red, swollen, and painful, and the patient had considerable fever, anorexia, and pain. Epsom salts, weak diaphoretics, and the dressings soothed the symptoms considerably. On February 8th the distal fragment of the fourth metatarsal bone was found to be movable, but still attached by its phalangeal articulation, and an effort to remove it proved impossible without injuring that joint. It was therefore decided to leave its removal to nature, and a seton was conducted through both wounds in order to keep them open and promote suppuration. Subsequently an exacerbation of the symptoms manifested itself, after which the foot showed an erysipelatous tendency by swelling, redness, heat, and puffiness. A solution of nitrate of silver with acacia, constantly applied for forty-eight hours, finally subdued the inflammation, when a profuse discharge of healthy pus followed and gave great relief to the patient. Thenceforward the stimulants were substituted by tonics, and water dressings took the place of all former local applications. In a very short time all the swelling and redness had left the foot, and the wound showed such a healthy appearance and discharged such small quantities of pus that I entertained hopes the fractured bone would heal without being removed. I then applied Sentin's starch bandage, which the patient still had on when he went home on furlough on March 15th. I afterwards heard that he was attacked with erysipelas and had entered Central Park Hospital, New York City." The patient was discharged at the latter hospital May 20, 1864, and pensioned. Examining Surgeon J. T. Burdick, of Brooklyn, N. Y., certified that "the flexor tendons of the middle toes and some of the ligaments of the pedal arch were injured." The pensioner was paid September 4, 1880.

CASE 901.—Private I. Parso, Co. F, 21st Wisconsin, aged 25 years, was wounded in both lower extremities, at Chickamauga, September 19, 1863. The injuries were produced by two musket balls, one of which fractured the first and second metatarsal bones of the right foot, the other fracturing the fibula of the left leg near its lower extremity. The wounded man passed through various hospitals and lastly entered Harvey Hospital, Madison, on July 12, 1864. Surgeon H. Culbertson, U. S. V., who operated in the case at the latter hospital, reported the following result of the injuries: "The patient was assigned to the Veteran Reserve Corps October 7th. The fracture of the metatarsal bone had united with a very large provisional callus, which interfered with the action of the extensor tendons and compressed the tarsus. This growth was mainly developed from the first metatarsal bone, which jutted over the second, the parts being tender and the patient unable to walk without pain. In order to accomplish the chiseling off of the exostosis, if possible, or failing in this, to remove a portion of the first metatarsal together with the diseased bone, an incision was made down to the bone, commencing one-half inch from the metatarso-phalangeal articulation and extending two and three-quarter inches along the inner border of the first metatarsal. Another incision of two inches was then carried over the dorsum of the foot down to the superficial fasciæ and at right angles with the first cut, care being taken not to divide the extensor tendons. The soft parts were now separated with the handle of a scalpel, preserving the periosteum as much as possible, and the bone was sawn through with a metacarpal saw about one inch from the metatarso-phalangeal joint. The old line of the fracture, three-fourths of an inch from the tarso-metatarsal joint, was next separated with a strong narrow knife and removed with the diseased structure. A portion of the exostosis, projecting from the upper fragment and jutting over the second metatarsal bone, was removed with the forceps. No vessels required ligating. The wound was left open for two hours until all bleeding had ceased, after which the edges were brought together and secured with sutures and adhesive plaster. A compress secured by bandages was applied over the seat of the wound for twelve hours; the foot was elevated and cold-water dressings were used. The external wound healed by first intention and the patient progressed well. He was returned to duty February 20, 1865." The removed exostosis, one inch in length, and contributed to the Museum by the operator, constitutes specimen 3694 of the *Surgical Section*. The patient was mustered out of service August 19, 1865, and pensioned. Dr. J. F. Force, pension examining surgeon at Heron Lake, Minnesota, states that "the great toe was left, but it is so tender that he can use it but little in walking. The left ankle joint is considerably weakened. His bodily health is good." The pensioner was paid June 4, 1881.

CASE 902.—Surgeon T. H. Squire, 89th New York, records that "Private C. M. Yarnes, Co. F, 89th New York, aged 24 years, was wounded at the storming of a fort on the Nansemond River, April 19, 1863, by a musket ball, which entered the outer margin of the right foot at the root of the little toe and came out on the inner margin of the foot just below the ankle, traversing the whole sole of the foot diagonally and below the bones. I think the phalangeal extremity of the metatarsal bone of the little toe was injured, but not the rest of the bones, and whether any of the vessels were injured or not was more than I could tell, though there had been no hæmorrhage. The wound of entrance was small, while that of exit was large, ragged, and pouting. The first day after the injury the foot was hot and painful. I placed it in an easy elevated position, applied wet dressings, and drew blood liberally from the patient's arm, from which time the pain grew less. By April 25th the foot had a good appearance. On June 6, 1863, the patient went home on furlough. He had done well. The wound of entrance had suppurated freely and bone was apparently yet to come out of this opening." He was ultimately mustered out of service August 3, 1865, and pensioned. Examining Surgeon J. G. Orton, of Binghamton, N. Y., December 14, 1872, stated that "the action of the ankle joint is much impaired, obliging the patient to walk almost entirely on the heel and always giving him a limping motion. The disability is permanent in its present degree." The pensioner was paid December 4, 1880.

CASE 903.—Private J. Johnson, Co. D, 4th U. S. Artillery, aged 36 years, was wounded in the right foot, at Drury's Bluff, May 14, 1864. He was admitted to Point Lookout Hospital three days afterwards, where Acting Assistant Surgeon J. Gilman recorded the following: "The wound was from a minié ball, which entered at the dorsal surface and was taken out at the plantar aspect, having fractured the metatarsal bone of the great toe. Gangrene set in, destroying the continuity of the dorsalis pedis artery and necessitating ligation, which was performed on July 20th by Surgeon A. Heger, U. S. A., in charge of the hospital, who enlarged the wound and tied the artery above and below. The case progressed favorably, the gangrene being cured and the wound granulating, when the patient was transferred to Judiciary Square Hospital at Washington on August 6th." He was subsequently transferred to Fort Washington, and on July 16, 1865, he was discharged from service and pensioned by reason of "difficulty in walking in consequence of the wound." Examining Surgeon J. O. Stanton, of Washington, D. C., reported, September 10, 1873: "The cicatrix is large, now open, and discharging. He has no motion of the great toe." The pensioner died at the Soldiers' Home, Washington, D. C., November 6, 1878.

CASE 904.—Private J. T. Bartley, Co. B, 38th Indiana, aged 20 years, was accidentally shot in the left foot, at Nashville, March 3, 1864, the ball passing in at the arch, fracturing the third metatarsal bone, and coming out at the plantar surface. On the following day he was admitted to hospital No. 1, whence he was transferred to Jeffersonville two months afterwards, and subsequently to No. 6, at New Albany. Acting Assistant Surgeon E. S. Crosier, in charge of the latter hospital, reported that owing to troublesome hæmorrhage the anterior and posterior tibial arteries were ligated by Acting Assistant Surgeon J. Grant six days after the reception of the injury, also that the parts were attacked with gangrene during the early stage of the case. The patient recovered and was discharged from service April 10, 1865. He is not a pensioner.

CASE 905.—*Shot fracture of toe.*—Corporal R. Steele, Co. F, 27th Massachusetts, aged 23 years, was wounded in the left foot, during the skirmish at Gum Swamp, May 22, 1863. Surgeon E. P. Morong, 2d Maryland, recorded his admission to Foster Hospital, New Berne, and his return to duty one month afterwards. Surgeon G. A. Otis, 27th Massachusetts, made the following report: "Corporal Steele was sent to me from Foster Hospital June 25th. He had been under treatment for a wound at the phalangeal articulation of the left great toe, caused by an Enfield rifle ball. Dead and detached fragments of the distal phalanx could be felt and the wound showed no disposition to cicatrize either on the dorsal or palmar aspect. I laid open the toe and removed the loose fragments, including the entire distal phalanx and part of the proximal phalanx." The man recovered and subsequently continued with his regiment until mustered out September 27, 1864. In 1880 he became an applicant for pension by reason of alleged painfulness in walking.

CASE 906.—*Shot fracture of tarsal bones; death.*—Captain C. E. Jennings, Co. G, 26th New York, was wounded in the foot, at Bull Run, August 30, 1862, and was conveyed to Washington. Surgeon C. L. Allen, U. S. V., reported: "The patient was a man about thirty years of age, of a sanguine temperament, and apparently of good constitution and fair health previous to being wounded; while he was at Alexandria, on his way to Washington, a surgeon had declared the necessity of amputation; but before the operation could be performed the patient was taken to Washington. The ball had entered on the inner side of the foot and passed through the three cuneiform bones and the cuboid, the wound of exit being upon the external and upper surface of the foot. On September 27th the foot was enormously swollen, and there were five or six openings besides the original wounds discharging large quantities of unhealthy sanious pus. The leg and even the thigh were very much swollen and œdematous, and the lower third of the leg was marked by several long cicatrices, said to be the results of incisions made early in the case for erysipelatous inflammation. His general condition was that of marked hectic and his emaciation was great. He had also considerable dyspnœa and complained of pain in his chest, for which sinapisms were being applied. Compound tincture of cinchona and tincture of cantharides, with brandy and liberal allowance of beef-essence, etc., were now immediately ordered for the patient, hoping but not expecting to raise him to a condition to sustain amputation of the leg. Although crowding the nourishment and stimulants to the utmost he continued to sink, and died on October 1, 1862. No *post-mortem* examination was held."

CASE 907.—*Shot fracture of first metatarsal bone; death.*—Private W. S. Hodgkins, Co. A, 14th New York Artillery, aged 27 years, was wounded at Spottsylvania, May 10, 1864, and entered Emory Hospital, Washington, two weeks afterwards. Surgeon N. R. Moseley, U. S. V., reported: "The patient was received with gunshot wound of left foot, fracturing the first metatarsal bone. Cold-water dressings were applied to the wound and alteratives were given internally. This treatment was continued for some weeks, the wound doing well, although the patient's constitutional health was very poor. On June 29th stimulants with alteratives were ordered, and warm applications were made to the wound, which appeared to be obstinate in healing. On July 20th simple cerate dressings were commenced, the wound appearing healthy in some parts, though peculiarly unhealthy around the edges; internal treatment continued. One month later the wound was erysipelatous in appearance and warm poultices were again applied; patient's appetite still good. By September 9th erysipelas and gangrene had invaded the wound and creasote was added to the poultice; stimulants given internally. In about ten days cold-water dressings were resumed, gangrene having disappeared, but the parts still being unhealthy. On September 27th the patient was attacked with chills followed by high fever, when antiperiodics and tonics were prescribed and warm applications were again used. Several days afterwards the patient began to sink rapidly. He died October 3, 1864, from the effects of irritative fever produced by the unhealthy wound."

EXCISIONS IN THE BONES OF THE FOOT.—Ablations of one or more of the metatarsals with their corresponding toes have been classified with partial amputations of the foot and will be cited hereafter. The cases to be considered in this group will be confined to excisions of the tarsal bones or of the metatarsal bones without removal of the corresponding toes. Ninety-seven cases of this nature have been recorded. The results in four cases were not determined. Seventy-five were successful and eighteen proved fatal, a mortality rate of 19.3 per cent. Of the ninety-seven operations, thirty-one involved the tarsal bones, five the tarso-metatarsal articulation, fifty-seven the metatarsal bones, and four the metatarso-phalangeal articulation, as indicated in the following table:

TABLE XCVI.

Numerical Statement of Ninety-seven Cases of Excisions in the Bones of the Foot.

PARTS EXCISED.	CASES.					PRIMARY.			INTERMEDIARY.		SECONDARY.		TIME NOT SPECIFIED.		
	Total.	Recoveries.	Deaths.	Undeterm'd	Percentage of Mortality.	Recoveries.	Deaths.	Undeterm'd.	Recoveries.	Deaths.	Recoveries.	Deaths.	Recoveries.	Deaths.	Undeterm'd.
Excision in the Tarsal Bones	31	25	5	1	16.6	10	3	1	4	1	9	1	2		
Excision in the Tarso-Metatarsal Articulation	5	3	2		40.0	1	1		1	1	1				
Excision in the Metatarsal Bones	57	46	8	3	14.8	28	5	1	10	2	6		2	1	2
Excision in the Metatarso-Phalangeal Articulation	4	1	3		75.0	1	2			1					
Aggregates	97	75	18	4	19.3	40	11	2	15	5	16	1	4	1	2

Fifty-three of the ninety-seven operations were primary, twenty intermediary, seventeen secondary, and in seven the intervals between the injury and the operation could not

be ascertained. A few examples of each of these groups will be detailed, and a brief account of all cases given in a condensed tabular statement.

PRIMARY EXCISIONS IN THE BONES OF THE FOOT.—The results were ascertained in fifty-one of the fifty-three primary excisions; forty were successful, eleven fatal. In five instances, two successful and three fatal, the limb was subsequently amputated in the leg.

CASE 908.—Captain A. Badeau, Aide-de Camp on Brigadier General T. W. Sherman's Staff, was wounded in the left foot, fracturing the tarsal bones, before Port Hudson, May 27, 1863. He was admitted to the field hospital of the 2d division, Nineteenth Corps, where he was treated by Surgeon E. F. Sanger, U. S. V., who contributed the following description of the case: "The ball penetrated at the instep and came out below the internal malleolus. I resected the middle cuneiform bone, portions of the internal and external cuneiform, and the proximal end of the second metatarsal, on account of which operation he was sent to New Orleans permanently disabled. I met him during the following fall at Newport, R. I. He was then still lame and went on crutches." About ten months after being wounded, Captain Badeau was promoted and appointed on the Staff of General Grant, in which position he continued up to a short time before being retired from active service on May 18, 1869. In addition to the history of the case, forwarded by Dr. Sanger on February 26, 1878, the operator makes the following mention of the result of the injury: "I learn that the arch of the foot is somewhat depressed by the wound and operation, tending slightly to valgus."

CASE 909.—Lieutenant L. A. Dubois, Co. E, 120th New York, aged 24 years, was wounded in the right foot, before Petersburg, September 20, 1864. Surgeon O. Everts, 20th Indiana, reported his admission to the field hospital of the 3d division, Second Corps, with "shot fracture of metatarsus, followed by resection." Surgeon H. F. Lyster, 5th Michigan, who performed the operation, reported that the second metatarsal bone was fractured and the posterior tibial artery lacerated, also that the operation consisted of the excision of the distal extremity of the fractured bone and of the ligation of the lacerated artery, and was followed by "recovery with a useful foot." The patient was transferred from the field to the Depot Hospital at City Point, where he obtained a leave of absence on October 8th. On January 10, 1865, he was discharged from service and pensioned. Various examining surgeons have certified to the injury resulting in considerable "lameness, much pain and difficulty in walking." The pensioner was paid September 4, 1880.

CASE 910.—Private B. J. Smith, Co. G, 21st Kentucky, aged 22 years, was accidentally wounded in the left foot, and was conveyed to Cumberland Hospital, Nashville, November 28, 1864. Surgeon B. Cloak, U. S. V., reported: "The metatarsal bone of the second toe was fractured, and the adjacent parts were much swollen by irritation from the comminuted bone. Acting Assistant Surgeon T. C. Eakin made an incision on November 28th, two and a half inches in length on the dorsal surface of the foot, and excised two-thirds of the fractured metatarsal bone. Chloroform was the anæsthetic used; the patient was in good health at the time of the operation. Several days afterwards erysipelas of a simple cutaneous character attacked the foot but was easily arrested. About one month after the operation the patient was progressing favorably." He was subsequently transferred to hospital at Louisville, and lastly to Camp Dennison, where he was mustered out of service September 11, 1865. There is no record of his ever having applied for pension.

CASE 911.—Private J. Leunze, Co. C, 71st Ohio, aged 37 years, was wounded in the right foot, at Campbellsville, November 26, 1864, and entered hospital No. 1, at Nashville, the following day. Surgeon B. B. Breed, U. S. V., reported: "Gunshot fracture of first metatarsal bone; foot much inflamed and tumefied; tarso-metatarsal articulation opened; patient's constitutional condition good; secretions natural. Excision of the first metatarsal bone was performed on November 28th, by Acting Assistant Surgeon C. H. Fisher, while the patient was under the influence of chloroform. The treatment consisted of water dressings and nutritious diet. Wound healing kindly when the patient was transferred to Louisville, December 20th." Subsequently the patient was transferred to Camp Dennison, where he was discharged from service May 16, 1865, by reason of "paralysis of foot and toes resulting from the wound." Several years afterwards the man became an applicant for pension and was examined by Surgeon L. Whiting, of Canton, Ohio, who certified, April 29, 1868, as follows: "There is great deformity and disability of the injured foot. A large part of the metatarsal bone of the great toe is lost, and the toe itself is so distorted that it now lies at least an inch posterior to its original locality. * * * The weight of the body in walking is sustained by the heel and a portion of the external border of the foot."

CASE 912.—Private J. C. Troutman, Co. K, 3d Tennessee, aged 29 years, was wounded accidentally in the left foot, at Kingston, June 19, 1864. After remaining at a field hospital for over two months he was transferred to Chattanooga, whence Assistant Surgeon C. C. Byrne, U. S. A., described the injury as "a shot fracture of the second and third metatarsal bones. Excision of the fractured bones was performed on the field through an incision three inches in length, chloroform being used. At the time of the operation the parts were inflamed and swollen, but the patient was in good constitutional condition. Cold-water dressings constituted the treatment and favorable progress followed." The patient subsequently passed through other hospitals, and was ultimately discharged from Brownlow, Knoxville, July 8, 1865, by reason of "much impairment of the usefulness of the foot." Two years afterwards he made application for pension and was examined by Surgeon A. B. Tadlock, of Knoxville, who certified to the injury and stated: "The second and third metatarsal bones have been exsected, which permanently damages the arch of the foot and materially obstructs locomotion." Owing to subsequent failures to respond the man's claim was suspended by the Pension Office in 1873.

CASE 913.—Private P. Pero, Co. C, 2d New York Cavalry, aged 22 years, was wounded in the right foot, while on picket duty near Alexandria, May 5, 1864. Surgeon C. Powers, 160th New York, in charge of the Alexandria Hospital, made the following report: "The ball entered at the inner side of the middle of the metatarsal bone of the great toe and emerged over that of the little toe. The first, second, third, and fourth metatarsal bones were shattered. The patient suffered considerable pain. Two days after the injury excision of the first metatarsal bone was performed and the shattered fragments of the second, third, and fourth were removed by Assistant Surgeon C. H. Andrus, 128th New York. Chloroform was used, and the patient reacted

promptly. He did well afterwards. Five days after the operation considerable hæmorrhage occurred, but was completely arrested by light pressure on the dorsal artery. Simple water dressings were used. The case was still doing well when the patient was, on May 22d, transferred to University Hospital at New Orleans." Surgeon S. Kneeland, U. S. V., in charge of the latter hospital, reported the result of the case as follows: "The whole foot became greatly swollen, purulent inflammation having occurred on the dorsal and plantar surfaces; several of the bones became disorganized and the tibio-tarsal articulation completely anchylosed; patient greatly reduced by the excessive suppuration; pulse 78; appetite tolerably good. He also suffered from chronic diarrhœa and intermittent fever, from which he had recovered on June 20th, when the leg was amputated at the middle third by Acting Assistant Surgeon F. Hassenburg. Chloroform was used, and the hæmorrhage attending the operation was slight. Under a supporting diet and cool dressings the patient did well up to June 30th. He died from the effects of chronic diarrhœa July 15, 1864."

CASE 914.—Private J. G. Fowler, Co. K, 42d Illinois, was wounded in the left foot, at the battle before Nashville, December 15, 1864. He was admitted to Cumberland Hospital at Nashville, whence Surgeon B. Cloak, U. S. V., reported: "The metatarsal bone of the second toe was fractured and two-thirds of its tarsal extremity was excised the day after the injury. One week after the operation trismus set in, the patient complaining of stiffness of the jaws, and on the following day the muscles of the neck and shoulders were in a state of tonic spasm. The patient was placed under the influence of chloroform and the wound was thoroughly cleaned out with the knife, after which concentrated nitric acid was applied. Large quantities of opium were administered internally, but without effect. On December 25th opisthotonos ensued, in which condition the patient died at 8 A. M."

INTERMEDIARY EXCISIONS IN THE BONES OF THE FOOT.—Twenty cases with fifteen recoveries and five deaths, a mortality rate of 25.0 per cent., belong to this group. In two of the fifteen cases of recoveries the patients subsequently submitted to amputations in the leg:

CASE 915.—Private J. M. Cole, Co. G, 8th Michigan Cavalry, aged 22 years, was accidentally wounded in the right foot, at Waynesboro', November 20, 1864, and entered hospital No. 1, Nashville, eight days afterwards. Surgeon B. B. Breed, U. S. V., who operated in the case, made the following report: "The wound was caused by a ball entering the dorsal surface, fracturing the third and fourth metatarsal bones, and emerging directly opposite on the plantar aspect. The foot became highly inflamed and tumefied; tarso-metatarsal articulation opened; patient suffering much from pain; appetite impaired; bowels constipated. The third and fourth metatarsal bones were excised on November 30th through an incision two and a half inches long on the dorsal surface. Chloroform was used. Hospital gangrene appeared in the wound five days after the operation and was promptly arrested by one application of undiluted bromine. After this the wound healed rapidly. Cold-water dressings were used and nourishing diet was furnished. On December 21st the patient was transferred to Louisville." He was ultimately discharged from Harper Hospital, Detroit, May 12, 1865, by reason of permanent lameness resulting from the wound. Examiner D. A. West, of Lexington, Michigan, June 13, 1877, certified to the wound, loss of metatarsal bones, etc., and added that "the cicatrix is very sensitive to the touch. There appears to be bulbous extremities of some of the nerves," etc. "A spicula of bone is now troubling the plantar surface and may necessitate removal." The man's application for pension was rejected owing to his inability to produce corroborative evidence as to the cause of the reception of the injury.

CASE 916.—Private M. H. Hargrave, 8th Indiana Battery, aged 42 years, was wounded at Chickamauga, September 20, 1863. He was admitted to the field hospital at Crawfish Springs, where Surgeon A. Ewing, 13th Michigan, recorded the injury as "a wound of the left foot, the ball entering the centre of the metatarsal bone, going inward and backward through the tarsus, fracturing all the bones in its passage. Resection of the os calcis and portion of the astragalus was performed on September 29th." After passing through other hospitals subsequently the patient was transferred to Evansville, March 8, 1864, the wound having healed previous to that date. On December 30, 1864, he was mustered out of service and pensioned. Various examining surgeons certified to his inability to walk without crutches. The pensioner died November 16, 1871. His attending physician, Dr. F. W. Billert, testified: "He came under my personal observation when he was discharged from the army; was then very much prostrated, and prostration was succeeded by violent reaction and fever, terminating in general nervous exhaustion. This left him partially paralyzed in the lower extremities, broke down his constitution, and finally generally paralysis, it is supposed, took place, resulting in death."

CASE 917.—Private M. Goffney, Co. A, 114th New York, aged 27 years, was wounded at Cedar Creek, October 19, 1864. Assistant Surgeon J. Homans, jr., U. S. A., reported his admission to the field hospital of the 1st division, Nineteenth Corps, with a "severe bullet wound of the bones of the left foot." Surgeon T. B. Reed, U. S. V., reported the following result of the injury: "The patient was admitted to Filbert Street Hospital, Philadelphia, five days after receiving the wound. The missile had entered at the insertion of the tendo-achillis and remained hidden among the bones of the foot. The os calcis and the astragalus were fractured. After admission the parts commenced to slough; circulation became feeble; appetite depraved, and general condition bad. Hæmorrhage from the posterior tibial artery to the amount of eight ounces occurred on October 31st, when Acting Assistant Surgeon E. L. Duer ligated the vessel in the continuity behind the malleolus, removed a portion of the os calcis and extracted the ball. Ether was used as the anæsthetic. The patient did not recover from its influence for several hours, then suffered from nausea constantly, became jaundiced, and presented decided pyæmic symptoms. The treatment consisted of mercurials, tonics, stimulants, and nutritious diet. Cups were applied over the liver and nitric acid to the wound, followed by permanganate of potash. Death resulted on November 9, 1864. At the *post-mortem* examination no metastatic abscesses were found, nor any pus except in the joints of the foot; liver greatly engorged; blood fluid and dark; stomach softened; gall bladder empty."

CASE 918.—Private W. W. McKeran, Co. H, 3d Michigan, was wounded in the foot, at Fair Oaks, May 31, 1862, by a musket ball, which entered the outer side of the fifth metatarsal bone and made its exit at the first metatarsal just behind the great toe. He was admitted to Judiciary Square Hospital, Washington, four days afterwards, where the wound went on slowly for some days. The foot was probed and portions of the metatarsal bones were found to be bare and broken. There being no apparent natural effort to throw off the fragments, the upper wound was enlarged and one-half the second metatarsal bone,

including the phalangeal articulation, was removed, together with considerable fragments of the third and fourth metatarsals. On the following day there was some pain, but no hæmorrhage. On June 26th the patient was much better; foot a little red; poultices applied. June 28th, severe chills; quinine administered. June 29th and 30th, patient the same; foot inflamed a little. July 1st, very severe chills and fever; skin and conjunctivæ yellow; tongue brown, dry, and horny. July 2d, bad symptoms increased. July 3d, continuous vomiting; jaundice worse; tongue more moist. July 4th, patient apparently a little better. July 5th, foot improved, but general aspect bad. Patient died July 6, 1862. The history was contributed by Acting Assistant Surgeon D. W. Cheever, who also forwarded the removed portions of the metatarsal bones. (*Cat. Surg. Sect.*, 1866, p. 420, *Spec.* 506.)

SECONDARY EXCISIONS IN THE BONES OF THE FOOT.—One of the seventeen secondary excisions in the bones of the foot was followed by death. Of the sixteen patients who survived the operation one subsequently suffered amputation in the leg. The names of twelve are found on the Pension Rolls; one has died since his discharge from the service of Bright's disease of the kidneys.

CASE 919.—Sergeant T. Barbin, Co. C, 81st Pennsylvania, aged 18 years, was wounded in the right foot, at Fredericksburg, December 13, 1862. Assistant Surgeon C. R. Greenleaf, U. S. A., contributed the following report of the injury: "He received the wound from a conoidal ball, which passed directly through the boot and entered the heel, passing through the os calcis in an oblique direction from behind forward and from above slightly downward. Considerable hæmorrhage attended the wound, and after an attempt at walking the man was carried to a house near by, where a bandage was applied. Two days afterwards he was taken to Washington and admitted to Mount Pleasant Hospital, where cold-water dressings were applied. Eight days later he was transferred to Mower Hospital, Philadelphia, where, on examination, the bone was found to be carious, and poultices were ordered. From this date until the time of the operation several pieces of bone were discharged and some small abscesses were opened. As no improvement was observed and the probe could be passed entirely through the bone, showing a considerable loss of substance, it was finally determined to remove the os calcis. On May 16th I proceeded with the operation, being assisted by Drs. J. H. B. McClellan and C. R. McLean (Acting Assistant Surgeons), and the patient being freely under the influence of chloroform. An incision was commenced a little in front of the articulation between the cuboid and calcis and carried around the heel, parallel with the long axis of the calcis, to a point just posterior to the posterior tibial artery; another was made at right angles to this, about two and a half inches in length, through the tendo-achillis. The flaps were then dissected back and disarticulation was effected in the manner recommended by Mr. Erichsen, the operation being completed in thirty minutes and no artery requiring ligation being cut. Monsell's solution was used to control the hæmorrhage from the smaller arterial twigs and veins. The flaps were accurately brought together and retained in position by silver-wire sutures, an opening being left posteriorly for the escape of fluids. Cold-water dressings were used. One-half grain of morphia was given, and some little febrile action during the next two days was controlled by spirits mindereri. On May 18th, Smith's anterior splint was applied to the leg and adhesive strips from the toes to a point near the incision. The incisions on the inner side of the foot healed by first intention and the sutures were withdrawn on May 20th, and a sponge tent was ordered to keep open the posterior point of exit, which had closed by granulations. On May 22d all the sutures were removed and adhesive strips re-applied. Large quantities of grumous pus were being discharged. The patient continued to improve, and on the 24th the splint was removed, a sling made from a sheet being substituted. After this the patient improved rapidly and left his bed on June 12th, the wound having healed with the exception of a slight track at the junction of the two incisions, from which a little healthy pus was being discharged. By June 17th the patient could bear his weight on the foot, the sinus having closed. The contour of the foot was not materially altered, the sole being a little flatter than its fellow. He was in excellent health and fine spirits, and felt no pain when bearing his weight on the foot, but said that it felt very springy." In addition to the history, Dr. Greenleaf also stated that as soon as the parts had become a little hardened and accustomed to their new position, a shoe filled with hair at the heel was to be furnished to the patient. The subsequent records of the hospital show that the patient was able to wear his shoe by July 15th, and could walk without crutch. Afterwards he was allowed to stay at his home in Philadelphia on furlough, getting stronger every day and his foot being entirely healed. On November 30, 1863, he was discharged from service and pensioned. Examining Surgeon W. Jewell, of Philadelphia, September 14, 1866, certified that "the removal of the os calcis has left the pensioner lame in his gait but not otherwise injured. Other examiners report nothing additionally important. The pensioner was paid September 4, 1880. The excised calcaneum, contributed to the Museum by the operator, and exhibiting general caries, constitutes specimen 1286 of the *Surgical Section*.[1]

CASE 920.—Private M. Dean, Co. F, 4th Kentucky, aged 24 years, was wounded in the right foot, at Chickamauga, September 19, 1863. He was sent to hospital at Chattanooga, and thence one month afterwards to hospital No 1, at Nashville. Surgeon C. W. Horner, U. S. V., in charge of the latter, reported: "The wound penetrated the structure of the tarsus and metatarsus. The parts became considerably swollen, painful, and involved in suppurative inflammation. The patient's system was much reduced from irritative fever and nervous disturbance. On December 7th Acting Assistant Surgeon G. P. Hachenberg made an incision about three inches in size and excised the cuboid bone, using two parts of chloroform and one of sulphuric ether as an anæsthetic. The patient improved very slowly. Tonics and stimulants were administered, and warm-water dressings, and a weak solution of bromine was applied to the wound about two weeks after the operation." Three months after the date of the operation the patient was transferred to hospital No. 7, at Louisville, whence he was returned to duty June, 1864. At the expiration of his term of service, October 25, 1864, he was mustered out of service and pensioned. Various examining surgeons have certified to the injury and to the use of the foot and ankle as being very much impaired. The pensioner was paid September 4, 1880.

[1] A detailed account of this case by Surgeon C. R. GREENLEAF, U. S. A., will be found on page 389 of Vol. XLVI of the *American Journal of the Medical Sciences*, Philadelphia, 1863.

TABLE XCVII.

Summary of Ninety-seven Cases of Excisions in the Bones of the Foot.

Primary operations, 1—53; Intermediary operations, 54—73; Secondary operations, 74—90; Time of operation not specified, 91—97.

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1	Aldrich, W. S., Pt., B, 14th Infantry, age 21.	May 12, 12, '64.	Right; part of os calcis. Disch'd May 20, 1865; pensioned.
2	Anderson, F., Pt., H, 28th Pennsylvania, age 40.	May 25, 25, '64.	Left; third metatarsal. June 9, amputation toe. Vet. Reserve Corps March 29, 1865.
3	Anderson, J., Pt., F, 76th New York, age 19.	May 5, 5, '64.	Left. Duty December 9, 1864.
4	Badeau, A., Captain and Aide-de-Camp.	May 27, 27, 63.	Left; mid. and parts of int. and ext. cuneiform; end of 2d met. Surgeon E. F. Sanger, U. S. V. Retired May 18, 1869.
5	Chapman, P., Pt., H, 38th Illinois, age 36.	May 19, 19, '64.	Right; 2d metatarsal. Disch'd January 25, 1865; pensioned.
6	[1]*C——, G.*, —, —, age 23.	May 12, 12, '64.	Right; whole calcaneum; amp. left leg. Surg. — Strait, C.S.A. Recovery.
7	Donohue, M., Pt., G, 7th Rhode Island, age 23.	Dec. 5, 5, '64.	Left; metatarsal. Surg. L. W. Bliss, 57th N. Y. Duty April 28, 1865.
8	Drummond, A. H., Pt., H, 3d Maine, age 18.	Dec. 13, 13, '62.	Right; 3d and 4th metatarsals. Disch'd June 4, '64; pensioned.
9	Dubois, L. A., Lieut., I, 120th New York, age 24.	Sept. 20, 20, '64.	Right; end of 2d met. Surg. H. F. Lyster, 5th Mich. Disch'd January 10, 1865.
10	Eggleston, F., Pt., D, 8th New York Cavalry, age 21.	Nov. 12, 12, '64.	Right; head 1st phal. great toe; head 1st met. Surg. N. D. Ferguson, 8th N. Y. Cavalry. Mustered out June 19, 1865.
11	Freeman, D. R., Pt., D, 7th Wisconsin, age 21.	May 5, 5, '64.	Left; 4th metatarsal. Disch'd May 22, 1865; pensioned.
12	Garrity, P. H., Corp'l, H, 91st New York, age 24.	June 14, 14, '63.	Right; 2d metatarsal. A. Surg. J. T. Myers, 91st N. Y. Duty September 3, 1865; pensioned.
13	Goodwin, J. L., Lieut., H, 57th Mass., age 24.	July 22, 22, '64.	Right; 2d and 3d metatarsals. Disch'd Nov. 29, 1864. Died Nov. 22, 1869; consumption.
14	*Greenleaf, B. F.*, Pt., E, 5th Tenn. Cav., age 31.	Aug. 15, 16, '64.	Left; 2d metatarsal. To Provost Marshal Nov. 16, 1864.
15	Harrington, W. C., Pt., C, 1st Vt. H. A., age 19.	April 2, 2, '65.	Left; 5th metatarsal. Disch'd July 6, 1865; pensioned.
16	Henry, A. R., Pt., I, 12th Massachusetts, age 30.	May 12, 12, '64.	Right; 2d metatarsal. V. R. C. April 28, 1865; pensioned.
17	Hitchcock, B. F., Serg't, F, 149th N. York, age 24.	May 25, 25, '64.	Left; 2d metatarsal. Surg. J. V. Kendall, 149th N. Y. Disch'd June 12, 1865; pensioned.
18	Jock, D. B. W., Pt., H, 104th N. York, age 23.	July 1, —, '63.	Left; portion os calcis. Disch'd May 10, 1864; pensioned.
19	Leunze, J., Pt., C, 71st Ohio, age 37.	Nov. 26, 28, '63.	Right; 1st metatarsal. A. A. Surg. C. H. Fisher. Disch'd May 16, 1865; pensioned.
20	McGlinn, J., Corp'l, F, 66th Ohio, age 29.	July 28, 28, '64.	Right; 1st metatarsal. V. R. C. November 19, 1864.
21	Murray, M., Pt., F, 19th	July 30,	Left; lower half os calcis. Right;
22	Colored Troops.	Aug. 2, 1864.	5th metatarsal. Surg. D. MacKay, 29th C. T.; recovery.
23	Nash, C., Serg't, A, 82d Colored Troops, age 21.	April 4, 4, '65.	Right; 3d metatarsal. Surg. N. N. Horton, 47th C. T. Disch'd May 30, 1865.
24	Phalen, P., Pt., B, 117th New York, age 40.	Sept. 29, 29, '64.	Left; portion of os calcis. Discharged July 6, '65; pensioned.
25	*Pickett, G.*, Pt., B, 51st Virginia, age 20.	Sept. 19, 20, '64.	Right; portion cuboid. To prison February 16, 1865.
26	Richards, J., Pt., D, 5th Connecticut.	July 4, 4, '64.	Left; 4th and 5th metatarsals. July —, amp. leg; Aug. 12, re-amp. leg. Disch'd May 12, 1865. Died Feb. 24, 1867.
27	Rowell, P., Pt., A, 1st Maine H'vy Artillery.	June 23, 23, '64.	Left; 4th metatarsal. Duty June 7, 1865.
28	Ryan, J., Serg't, G, 4th West Va., age 25.	Nov. 24, 24, '63.	Right; 4th and 5th metatarsals. Surg. I. N. Barnes, 116th Ill. Disch'd July 6, '64; pensioned.
29	Scanlon, B., Pt., K, 103d Illinois, age 27.	Nov. 25, 25, '63.	Right; 1st metatarsal. Disch'd July 5, 1864; pensioned.
30	Shriver, G. A., Lieut., B, 119th Penn., age 23.	April 2, 2, '65.	Right; 1st metatarsal. Disch'd June 19, 1865; pensioned.
31	Smith, B. J., Pt., G, 21st Kentucky, age 22.	Nov. 28, 28, '64.	Left; two-thirds 2d metatarsal. A. A. Surg. T. C. Eakin. Erysipelas. Disch'd Sept. 11, 1865.
32	Smith, W. A., Serg't, C, 7th Infantry, age 39.	Feb. 21, 22, '62.	Right; 1st and 2d metatarsals. Disch'd Aug. 23, '62; pensioned.
33	Treanor, J., Lieut., H, 28th Mass., age 23.	June 3, 3, '64.	Left; os calcis. Surg. P. E. Hubon, 28th Mass. Disch'd Oct. 13, 1864. Died Feb. 8, 1870; consumption.
34	Troutman, J. C., Pt., K, 3d Tenn., age 20.	June 19, 22, '64.	Left; 2d and 3d metatarsals. Discharged July 8, '65; pensioned.
35	Troutman, P., Pt., A, 77th Penn., age 18.	May 27, 27, '64.	Right; os calcis. Surg. S. H. Kersey, 36th Ind. Discharged April 1, 1865; pensioned.
36	[2]Turner, H. A., Lieut. and Q. M., 43d Mass.	Nov. —, 1862, Primary.	Right; 3d metatarsal. Surg. A. C. Webber, 43d Mass. Duty December 21, 1862.
37	*Vandergriff, J.*, Capt., F, 53d Georgia, age 28.	———	Right; two metatarsals. Surg. J. J. Knott, 53d Ga. Recovery.
38	Van Gorder, C., Serg't, B, 39th Iowa, age 27.	Oct. 5, 6, '64.	Left; internal cuneiform. Surg, J. R. Zearing, 57th Ill. Disch'd June 5, 1865.
39	Weaver, G., Teamster, 97th New York.	July 13, —, '64.	Left; 2d and 3d metatarsals. Recovery.
40	Whittier, C., Pt., C, 12th Massachusetts, age 19.	Sept. 17, —, '62.	Left; large portion os calcis. Discharged Jan. 13, '63; since died.
41	Baumberger, J., Musician, H, 56th N. York, age 22.	Nov. 30, Dec. 2, 1864.	Right; ext. mid. cuneiform and scaphoid. Ass't Surgeon J. F. Huber, U. S. V. Died Dec. 26, 1864; pyæmia.
42	Fowler, J. G., Pt., K, 42d Illinois.	Dec. 15, 16, '64.	Left; two-thirds tarsal and 2d metatarsal. Died Dec. 25, 1864; tetanus.
43	Hall, A. A., Corp'l, M, 31st Maine, age 18.	April 2, 2, '65.	Left; metatarsal. Surg. J. H. Kimball, 31st Me. Died April 15, 1865.
44	Hanson, N., Pt., C, 38th Wisconsin, age 34.	June 17, 17, '64.	Left; metatarsal. Surg. W. B. Fox, 8th Mich. Died June 25, 1864; wound.
45	Hunt, P., Lieut., A, 1st Rhode Island Artillery.	May 30, 30, '64.	Right; os calcis. Surg. G. L. Potter, 145th Penn. Died June 14, 1864; pyæmia.
46	*Jones, J.*, Serg't, H, 21st Georgia.	May 3, 3, '63.	——; os calcis.
47	Judkins, A., Pt., B, 10th Maine.	May 2, 2, '63.	Left; metatar. and phal. of three mid. toes. Died June 14, 1863; gangrene of leg.
48	*Locke, J.*, Pt., G, 5th North Carolina.	July —, 1863.	Left; tarsal and metatarsal. Died July 18, 1863.
49	Norton, W. A., Capt., I, 100th Penn., age 23.	June 18, 18, '64.	Left; 5th metatarsal. Died July 21, 1864; exhaustion.
50	Pero, P., Pt., C, 2d New York Cavalry, age 22.	May 5, 7, '64.	Right; 1st metatarsal. A. Surg. C. H. Andrus, 128th N.Y. June 20, amp. leg. Died July 15, 1864; chronic diarrhœa.
51	Williams, J. M., Capt., C, 31st Maine, age 47.	June 3, 3, '64.	Right. Died June 15, 1864, of wound.
52	Wright, M. F., Major, 29th Ohio, age 26.	Dec. 20, 20, '64.	Left; tarsal; amputation of leg. Died January 7, 1865.
53	Young, —, Pt., G, 8th Ohio.	May 5, —, '64.	——; distal end 4th metatarsal. Surg. C. Bowen, 6th Penn. Res.
54	Arnot, T., Pt., E, 7th Michigan, age 28.	Sept. 17, Oct. 4, 1862.	Left; 2d metatarsal. A. A. Surg. J. Dickson. Discharged Nov. 3, 1862; pensioned.
55	Bailey, D., Pt., G, 3d Iowa Cavalry, age 26.	June 10, 14, '64.	Right; 3d and 4th metatarsals. A. A. Surg. J. N. Sharp, Feb. —, 1865, amp. leg. Discharged Sept. 11, 1865.
56	Bowen, M., Corp'l, H, 57th Mass., age 22.	May 18, 28, '64.	Left; portion os calcis. A. A. Surg. F. G. H. Bradford. Discharged May 13, 1865; pens'd.
57	Brouchard, A., Pt., A, 5th New Hampshire, age 34.	April 7, 17, '65.	Left; 2d and 4th metatarsals. A. Staff Surg. J. Aiken, U. S. A. Disch'd Aug. 12, 1865. Amp. leg. Feb. —, 1866, amp. knee joint; subsequent amp. thigh.
58	Cole, J. M., Pt., G, 8th Michigan Cavalry, age 22.	Nov. 20, 30, '64.	Right; 3d and 4th metatarsals. Surg. B. B. Breed, U. S. V. Discharged May 12, 1865.
59	Hargrave, M. H., Pt., 8th Indiana Battery, age 42.	Sept. 19, 29, '63.	Left; portion of os calcis and astragalus. Disch'd December 30, 1864. Died November 16, 1871; paralysis.
60	Jackson, R. G., Pt., A, 8th New York Heavy Artillery, age 23.	June 3, 9, '64.	Right; 1½ in. 3d metatarsal (erysipelatous). Ass't Surg. S. B. Ward, U. S. V. Disch'd Oct. 6, 1864; pensioned.
61	Jacobs, W. G., civilian, age 30.	Sept. 11, 16, '62.	——; third of os calcis. Disch'd Dec. 1, 1862; pensioned.
62	Kinsell, G. W., Pt., D, 184th Penn., age 19.	June 3, 20, '64.	Left; 4th and 5th metatarsals. A. A. Surg. E. L. Bliss. Disch'd May 18, 1865; pensioned.
63	McDougal, J., Pt., E, 2d N. Y. Cavalry, age 23.	May 26, 30, '64.	Right; 3d metatarsal. A. A. Surg. R. W. W. Carroll. Discharged May 22, 1865; pensioned.
64	Myerson, G., Pt., G, 14th Connecticut, age 24.	Oct. 14, 18, '63.	Left; os calcis. Surg. E. Bentley, U. S. V. Disch'd Aug. 18, '65.

65	Sherd, W., Corp'l, G, 11th Maine.	Aug. 16, —, '64.	Left; 2d metatarsal. A. A. Surg. F. Gauntt. Discharged May 24, 1865; pensioned.
66	Sweeney, B., Pt., B, 7th Infantry, age 30.	July 2, 22, '63.	Left. A.A. Surg. A. E.Carothers. Disch'd May 14, '64; pensioned.
67	Young, W. C., Corp'l, H, 24th Mich., age 29.	Nov. 27, Dec. 9, 1863.	Left; 3d and 4th metatar. Surg. E. Bentley, U. S.V. Duty July 13, 1864.
68	Zimmerman, B., Pt., B, 111th Penn., age 32.	June 15, 21, '64.	Left; 3d and 4th metatarsals. A. Surg. J. D. Johnson, U. S. V. Disch'd April 11, 1865; pens'd.
69	Carl, A. J., Pt., C, 5th Michigan, age 27.	July 3, 13, '64.	Right; upper half metatarsal of great toe. A. A. Surg. T. T. Devan. Died July 22, 1864; pyæmia.
70	Gaffney, M., Pt., A, 114th New York, age 27.	Oct, 19, 31, '64.	——; portion of os calcis. A. A. Surg. E. L. Duer. Died Nov. 9, 1864; pyæmia.
71	Green, T., Pt., I, 9th Massachusetts.	May 5, —, '64.	Left; 1st, 4th, and 5th metatarsals and mid. cuneiform. A.A. Surg. C. H. Van Tagen. Died May 28, 1864.
72	King, E., Pt., B, 1st Vermont Cavalry, age 18.	Aug. 25, 30, '64.	Right; 1st metatarsal. A. A. Surg. M. J. McHench. Died Sept. 11, 1864; pyæmia.
73	McKernan, W. W., Pt., H, 3d Michigan.	May 31, June 24, 1862.	——; half 2d metatarsal and parts of 3d and 4th. A. A. Surg. D. W. Cheever. Died July 6, 1862. *Spec.* 506.
74	Albert, J. B., Corp'l, K, 110th Penn., age 32.	Mar. 23, May 2, 1862.	Left; 1st metatarsal. A. A. Surg. J. Gibbons. Disch'd Oct. 14, 1862; pensioned.
75	[1] Barbin, T., Serg't, C, 81st Penn., age 18.	De.13,'62, May 16, 1863.	Right; entire os calcis. Ass't Surg. C. R. Greenleaf, U. S. A. Disch'd Nov. 30, '63. *Spec.* 1286.
76	Bennett, T., Pt., E, 5th Michigan, age 28.	July 2, Oct. 27, 1863.	Right; 4th and 5th metatarsals (necrosis). Disch'd Dec. 18,'63. Died May 12,'64; Bright's dis.
77	Dean, M., Corp'l, F, 4th Kentucky, age 24.	Sept. 19, Dec. 7, 1863.	Right; cuboid. A. A. Surg. G. P. Hachenburg. Disch'd Oct. 25, 1864; pensioned.
78	Dutton, L. N., Serg't, C, 3d Vermont, age 20.	De.13,'62, Jan. 16, 1863.	Left; int. cuneiform, portion of metatarsal. Disch'd April 1, 1863; pensioned.
79	Fender, B. F., Corp'l, B, 113th Illinois, age 30.	May 19, Nov. 29, 1863.	Right; 1½ in. 2d and 3d metatarsals (gangrene). Discharged; pensioned.
80	Fritchman, J., Serg't, E, 105th Penn., age 31.	July 2, Nov. 1, 1863.	Right; os calcis. A. A. Surg. T. G. Morton. Discharged Sept. 4, 1864.
81	Gage, C., Pt., D, 8th Maine, age 20.	May 20, 1864, Feb.8,'65.	Left; two metatarsal bones. A. Surg. J. Vansant. Disch'd May 15, 1865; pensioned.
82	Haws, C. B., Pt., B, 7th Maine, age 21.	Se.17,'62, Ja. 24,'63.	Left; portion of os calcis (necrosis). Duty June 9, 1863.
83	Hodges, G., Pt., K, 13th Michigan, age 19.	Sept. 20, Dec. 20, 1863.	Right; almost entire os calcis (necrosis). A. A. Surg. D. O. Farrand. Discharged April 25, 1864; pensioned.
84	Irwin, T., Pt., H, 11th Pennsylvania, age 26.	Se.17,'63, Nov. 3, 1863.	Left; portion of os calcis. Ass't Surgeon C. H. Alden, U. S. A. Discharged June 9, 1864.
85	Shinquin, E., Pt., E, 63d New York.	Se. 17,'62, Ja. 10,'63.	Right; base of os calcis. Vet. Res. Corps June 25, 1863.
86	Spielman, T., Pt., F, 95th Ohio, age 23.	Aug. 29, 1862, Se.21,'63.	Right; os calcis. Surg. J. G. F. Holston, U. S. V. July 10, '64, amputation leg; recovery.
87	*Stroud, D.*, Pt., B, 3d Mississippi, age 41.	Nov. 30, 1864, Jan.1,'65.	Left; 3d metatarsal. A. A. Surg. W. J. R. Holmes. To Provost Marshal May 6, 1865.
88	Twigg, O., Pt., C, 46th Ohio, age 23.	Au. 3,'64, Feb. 7, 1865.	Right; 5th metatarsal. A. A. Surg. W. H. Drury. Disch'd June 30, 1865; pensioned.
89	Yax, O., Pt., C, 22d Michigan, age 23.	Se. 20,'63, Jan. 20, 1864.	Right; almost entire os calcis. Surgeon C. S. Tripler, U. S. A. Disch'd May 2, '64; pensioned.
90	Freese, J. B., Pt., I, 1st Minnesota, age 25.	July 2, Au. 2,'63.	Left; os calcis. Died August 15, 1863; trau. fever and pyæmia.
91	Ferguson, A., Pt., C, 22d Kentucky, age 42.	July 12, —, '63.	Left; part of os calcis. Disch'd Nov. 21, 1864; pensioned.
92	O'Leary, C., Pt., F, 3d Infantry, age 22.	July —, 2, '63.	Left; portion 1st metatarsal. Discharged Aug. 20,'64; pensioned.
93	Whitefield, N., Pt., B, 16th Michigan, age 18.	June 27, —, '62.	Right; portion of os calcis. Discharged Dec. 18, 1862; pens'd.
94	Wendell, D. F., Pt., D, 60th Ohio, age 20.	June 17, —, '64.	Left; 2d metatarsal. Disch'd Feb. 27, 1865. Died August 8, 1870; consumption.
95	Wood, G. F., Pt., E, 24th Massachusetts, age 19.	May 23, —, '64.	Right; metatarsal. Died June 24, 1864; pyæmia.
96	*Cross, T.*, Pt., D, 21st South Carolina.	Oct. 8, —, '64.	——; 3d metatarsal; gangrene.
97	*Smith, L. S.*, Pt., —, 2d South Carolina.	Aug. 14, —, '64.	Left; metatarsal.

The operations were performed in the right foot in forty-four, in the left in forty-eight instances; in five cases the side was not indicated. Eighty-eight patients were Union, seven Confederates, and two unknown soldiers. In seven instances the excision in the foot was followed by re-amputation in the leg, and in one instance re-amputations were performed in the leg, at the knee joint, and finally in the thigh. Gangrene was noted in eight cases (five recoveries, two deaths, and one unknown result); pyæmia in eight (all fatal); erysipelas in one (recovery); and tetanus in one (fatal) instance.

AMPUTATIONS IN THE FOOT.—One thousand five hundred and eighteen amputations in the foot were recorded: in eighty-seven the operation was through the tarsal bones; in forty-one through the tarso-metatarsal articulation; in one hundred and thirteen from one to four metatarsals and the corresponding toes were amputated; in fifty cases the operation was simply denoted as "amputation of the foot;" and in one thousand two hundred and twenty-seven instances the operation was confined to the toes—embracing the ablation of one toe in one thousand and one instances; of two toes in one hundred and forty-five, of three toes in thirty-one, of four toes in eight, and of all five toes in eighteen instances; in twenty-four cases the number of toes removed was not stated.

Seven hundred and fifty were primary, two hundred and sixty-seven intermediary, and ninety-four secondary operations; in four hundred and seven the time of the operation was not indicated.

PRIMARY AMPUTATIONS IN THE FOOT.—Of the seven hundred and fifty primary operations the results were not ascertained in sixty-three; six hundred and fifty-one patients survived and thirty-six died, a mortality rate of 5.2 per cent. One hundred and sixty-one operations were through the tarsal or metatarsal bones; five hundred and eighty-nine were amputations of the toes.

CASE 921.—Private M. C. Fitzpatrick, Co. H, 2d New York Mounted Rifles, aged 50 years, was wounded before Petersburg, June 30, 1864. He was admitted to the field hospital of the 2d division, Ninth Corps, where Surgeon J. Harris, 7th Rhode Island, recorded: "Fracture of right foot by minié ball, followed by Chopart's amputation." Several days after the operation the patient was transferred to Washington, where he entered Stanton and subsequently Judiciary Square Hospital. The wound was reported as healing mostly by first intention, leaving an excellent stump. On April 1, 1865, the patient was discharged from service and pensioned, having been previously furnished with an artificial foot by the Jewett Patent Leg Co. Examiner H. N. Loomis, of Buffalo, N. Y., September 4, 1869, certified to the loss of the foot and stated: "Wound healed, leaving the ankle nearly powerless and the end of the stump and heel very tender. His general health is very feeble, with harassing cough and night sweats." The history of the case was accompanied by drawings copied in the adjoining woodcuts (FIGS. 356, 357). The pensioner died of consumption December 28, 1869.

FIG. 356.—CHOPART'S amputation; anterior view. [After a drawing.]

FIG. 357.—CHOPART'S amputation; lateral view. [After a drawing.]

CASE 922.—Private J. Armstrong, Co. H, 39th Illinois, aged 41 years, was wounded in the left foot, at Morris Island, August 15, 1863. Assistant Surgeon J. Trenor, jr., reported the following history: "A shell struck the phalanges and carried off all the toes except the fifth. Amputation was performed through the metatarsal bones at the centre of their continuity, immediately after the wound was received, by Surgeon C. M. Clark, 39th Illinois. Six days after the operation the wounded man was admitted to hospital No. 4, at Beaufort. The wound was then in a sloughy condition, with an exceedingly offensive discharge and every symptom of constitutional irritation. Cold-water dressings were used. The patient continuing to grow worse, a consultation of surgeons was held five days after his admission, when a second operation was deemed the best plan for saving his life, and Chopart's amputation was resolved upon for the next day. As a last resort, however, to avoid another operation, the dressings were changed to oakum, and in about sixteen hours a change for the better was evident in the aspect of the wound. It steadily continued to improve until the date of the report, August 31st, when there was every prospect that the foot would have a good cicatrix and a fair support sufficient for the weight of the body." In the following month the patient was transferred to McDougall Hospital, New York, and subsequently he was admitted to Marine Hospital, Chicago, where he was discharged from service November 3, 1864, and pensioned. In March, 1871, the stump was tender, swelling after exercise.

CASE 923.—Private M. Shaughnessy, Co. H, 2d Pennsylvania Artillery, aged 28 years, received a shot fracture of the bones of the left foot, before Petersburg, June 18, 1864. He was admitted to the field hospital of the 2d division, Sixth Corps, where primary amputation by Chopart's method was performed. Surgeon G. T. Stevens, 77th New York, who performed the operation,

reported that "the flap was made from the inner side of the foot, the sole being too much mutilated for Chopart's operation." Two days after the date of the injury the wounded man was transferred to Hampton Hospital, and several weeks later he was transferred to Philadelphia. He was discharged December 10, 1864, and pensioned. In his subsequent application for commutation the pensioner reported the stump of the foot as being in "good and healthy condition." His pension was paid June 4, 1880.

CASE 924.—Private J. Miller, Co. E, 6th Pennsylvania Reserves, aged 20 years, was wounded in the right foot, fracturing the bone, at Fredericksburg, December 13, 1862. He was admitted to the field hospital of the 3d division, First Corps. Surgeon C. Bower, 6th Pennsylvania Reserves, reported that he performed "amputation at the tarsus" on the day of the injury. Acting Assistant Surgeon H. Hirschfield reported the progress of the case as follows: "The patient was admitted to Harewood Hospital at Washington ten days after being wounded. Chopart's amputation had been performed on the field. On December 27th, when the case was first seen by me, there was much suppuration and the wound seemed to be drawn open by the tendo-achillis. I applied a splint to correct the tension and at first used cold water and afterwards warm dressings; tonics and stimulants were administered. By January 20, 1863, the wound had nearly healed and dry lint and bandages were used. A small abscess had appeared at the ankle and had been opened. About February 15th this opening became gangrenous and the leg in this locality swelled up to an enormous size—the abscess, which originally was only two inches long, growing into a large sore of circular shape three and a half inches in diameter. All the tissues and even the periosteum were destroyed. Healthy granulations, however, were finally brought out, and the part was healing but could not close up on account of necrosis in part of the tibia. While the healing process of the neighboring parts was progressing favorably, erysipelas set in and spread from the foot to nearly up to the knee, being attended by excessive sloughing of the original abscess. This soon passed off, however, and after a few days the wound again became healthy in appearance, decreased in extent, and the leg resumed its natural size rapidly. Things now went on favorably again for a time, when severe pain indicated another collection of matter above the line of the affected tibia and towards the middle of the leg, which was relieved by an incision two inches in length into the periosteum, giving free exit to the confined pus. This last opening healed up readily, and by June 1st nature had completed the exfoliation of the cortical substance of the tibia, which I removed four inches in length. The wound now healed up very rapidly, but several days afterwards gangrene re-appeared and continued up to June 10th. Poultices were continued in the mean time and the treatment was adapted to the exigencies of the case. During the progress of the case the patient's general condition, which was very good now, had varied according to the several complications, being sometimes very low and prostrated from hectic and diarrhœa, but always reacting rapidly. On June 14th healthy granulations once more showed themselves, and by July 8th the wound had closed up to the size of a two-shilling piece. Ten days later it was healed entirely, the patient's general condition being excellent." He was discharged from service September 4, 1863, and pensioned, and one year afterwards he was supplied with an artificial foot by the Palmer Arm and Leg Co. of Philadelphia. The pensioner was paid June 4, 1880.

CASE 925.—Private T. H. Hodgson, Co. F, 67th Ohio, aged 32 years, was accidentally wounded, at Folly Island, June 22, 1863, by a musket ball fracturing the left foot. Amputation by Chopart's method was performed the following day by Surgeon S. F. Forbes, 67th Ohio. The wounded man passed through various hospitals and was lastly transferred to Central Park, New York City, where, as soon as the stump had entirely healed, he was supplied with a "Hudson" artificial foot. Four months later, on August 9, 1864, the patient was discharged from service and pensioned. The Dayton, Ohio, Examining Board on January 16, 1871, reported a "well healed and very useful stump," and described the operation as very creditable to the operator and to the author of it. A cast of the stump (*Spec.* 1530), made about a year after the date of the operation and showing a firm and smoothly united cicatrix well up on the anterior face, was contributed to the Museum by Assistant Surgeon J. W. S. Gouley, U. S. A., and is represented in the adjoining wood-cut (FIG. 358).

FIG. 358.—CHOPART'S amputation of the left foot. [From a cast.]

In the succeeding three cases three or more of the metatarsal bones with the corresponding toes were removed. The remaining toes were a constant source of annoyance:

CASE 926.—Private R. P. Saint, Co. F, 123d Indiana, aged 22 years, was wounded in the right foot by a shell, during the siege of Atlanta, August 4, 1864. Partial amputation of the foot by removing the four outer toes, including the distal extremities of their metatarsal bones, and leaving the great toe intact, was performed on the day of the injury. The wounded man continued under treatment in various successive hospitals until June 11, 1865, when he was discharged from service and pensioned. Examiner G. W. Mears, of Indianapolis, certified, August 23, 1865: "The wound is now healed, but the foot and ankle are weak. As yet but little weight can be sustained on the foot and crutches are therefore still in requisition. It is, however, improving in strength and will soon be used in walking." On November 17, 1866, the same examiner stated: "What disables the pensioner most seriously is the pain suffered when the foot is much used, the eschar being yet tender to the touch from imperfect healing and liable to inflammation," etc. Examining Surgeon G. A. Haise, of Russell, Kansas, October 12, 1877, described the great toe of the injured foot as being drawn or lapped across the cicatrix. The pensioner was paid March 4, 1881.

CASE 927.—Private J. T. Lewis, Co. B, 38th Illinois, aged 21 years, was wounded in the right foot, before Atlanta, August 16, 1864. Surgeon M. G. Sherman, 9th Indiana, reported his admission to the field hospital of the 1st division, Fourth Corps, and described the injury as a "fracture of the metatarsus, followed by amputation of three toes by Surgeon S. H. Kersey, 36th Indiana." The wounded man subsequently passed through various hospitals and was, lastly, transferred to Jeffersonville. Assistant Surgeon A. B. Prescott, U. S. V., in charge of the latter, described the operation as a "flap-amputation of the three lesser toes at the tarso-metatarsal articulation." On June 1, 1865, the patient was discharged from service and pensioned. Examining Surgeon J. Portness, of Xenia, Illinois, certified, April 6, 1866: "The third, fourth, and last toes with their metatarsal bones have been removed, leaving only the great and second toe. This renders the sole of the foot very narrow and destroys the elasticity of the arch of the foot in a great measure." The reports of subsequent examinations show no additional information. The pensioner was paid December 4, 1878, since when he has not been heard from.

CASE 928.—Sergeant H. S. Carroll, Co. D, 33d Missouri, aged 20 years, was wounded in the left foot, at the battle of Lake Chicot, June 6, 1864, by a shell which destroyed the second, third, and fourth toes. He was admitted to the Sixteenth Corps Field Hospital, where partial amputation of the injured foot was resorted to by Surgeon A. T. Bartlett, 33d Missouri, who described the operation as having been performed through the second, third, and fourth metatarsal bones. From the field the patient was sent to Adams Hospital, at Memphis, where he remained under treatment for four months, when he was returned to duty. He was discharged August 10, 1865, and pensioned. Various examiners have from time to time certified to "irritation and swelling of the foot when much used;" and Dr. H. E. Jones, of Louisiana, Missouri, added, January 12, 1878, that "the big toe is drawn nearly at right angle with the foot and rests on the little toe." The pensioner was paid June 4, 1881.

CASE 929.—Private C. L. Daniels, Co. K, 57th Massachusetts, aged 18 years, was wounded before Petersburg, July 20, 1864. Surgeon M. K. Hogan, U. S. V., reported his admission to the field hospital of the 1st division, Ninth Corps, with "shot fracture of the bones of the right foot, treated by Chopart's amputation." Acting Assistant Surgeon F. F. Maury reported the result of the case as follows: "The patient was admitted to South Street Hospital, Philadelphia, July 26th. He stated that he was wounded by a minié ball entering the right side of the foot and fracturing the bones to such an extent as to demand amputation on the field. He was sent to City Point and thence by hospital boat to this city. At the time of his admission to this hospital the patient was in a typhoid condition, fretful, irritable, and at times delirious. The stump was in a very good condition, with but a slight tendency to inflammation in the leg. This condition yielded readily to applications of laudanum and leadwater, after which the stump and leg both improved. Compound tincture of cinchonæ and afterwards quinine was prescribed; beef tea and milk punch were given. The typhoid fever did not yield to the treatment, the patient continuing to sink until July 29th, when death supervened." The amputated metatarsal and part of the tarsal bones (*Spec.* 6531), with the bullet attached and showing the seat of the fracture, were contributed to the Museum by Surgeon H. Ludington, 100th Pennsylvania, who performed the operation. A representation of the specimen appears in the wood-cuts (FIGS. 359, 360).

FIG. 359.—Fracture of metatarsal bones; dorsal view. *Spec.* 6531.

FIG. 360.—The same; plantar view.

CASE 930.—Private W. H. Jamison, Co. G, 24th Michigan, was wounded in the left foot, at Fredericksburg, April 29, 1863. Surgeon J. H. Beach, 24th Michigan, described the injury as follows: "A minié ball passed through the foot from right to left. All the metatarsal bones were injured and all but that of the second were comminuted fractures. The fractures extended to the tarso-metatarsal articulation in the first and in the fourth. Amputation was performed on May 1st, by Surgeon E. Shippen, U. S. V., at the tarso-metatarsal articulation by Lisfranc's method, a good covering being obtained from the plantar flap. Perfect anæsthesia was preserved during the operation by chloroform. The case was left at the First Army Corps Hospital and was doing well at last advices." Surgeon A. W. Whitney, 13th Massachusetts, reported that the patient died at the Fitzhugh House Field Hospital, May 24, 1863, from the result of the injury. The amputated bones of the foot (*Spec.* 1121) were contributed to the Museum by the operator.

In the following table one hundred and sixty-one primary amputations in the tarsal or metatarsal bones are enumerated; space will not permit to cite the amputations of the toes in this and the succeeding three tables:

TABLE XCIX.

Summary of One Hundred and Sixty-one Primary Amputations in the Tarsal and Metatarsal Bones for Shot Injury.

[Recoveries, 1—139; Deaths, 140—157; Unknown, 158—161.]

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.	No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Adams, J. N., Pt., K, 31st Wisconsin, age 27.	Sept. 17, 17, '64.	Left; Chopart's. Surgeon P. S. Arndt, 31st Wis. Discharged May 13, 1865; nec. of os calcis.	8	Brown, C. W., Pt., B, 3d Vermont, age 23.	Oct. 19, 20, '64.	Right; Lisfranc's. Discharged May 8, 1865.
2	Armstrong, J., Pt., H, 39th Illinois, age 37.	Aug. 15, 17, '63.	Left; Hey's; through the centre of continuity of metatarsals. Surg. C. M. Clark, U. S. V. Disch'd November 3, 1864.	9	Brown, L. C., Pt., E, 30th Colored Troops, age 29.	Oct. 27, 28, '64.	Left; Chopart's. Disch'd June 22, 1865; "stump not good; heel drawn up."
3	*Arney, A. P.*, Pt., H, 52d North Carolina, age 24.	April 2, 3, '65.	Right; Chopart's. Released July 10, 1865.	10	Bumgardner, S., Serg't, F, 14th West Va., age 34.	Sept. 22, 22, '64.	Right; Chopart's; also amp. left leg. Disch'd March 4, 1865. "No better than if amputated in lower third leg."
4	*Avery, J. R.*, Lieut., B, 53d Georgia, age 30.	Oct. 29, —, '63.	Left; Chopart's. Surgeon J. J. Knott, 53d Georgia. Recovery.	11	Burnside, G. M., Pt., E, 89th N. York, age 21.	June 18, 18, '64.	Left; Chopart's, Surgeon G. T. Stevens, 77th N. Y. Disch'd; stump healed.
5	Bean, G. H., Lieut., H, 21st Mass., age 20.	July 20, 20, '64.	Right; 3d and 4th toes and metatarsal bones. Discharged Aug. 30, 1864; pensioned.	12	Butner, A., Pt., E, 15th Kansas Cav., age 18.	Dec. 6, 7, '63.	Right; Chopart's. A. A. Surg. J. Thorne. Disch'd May 18, 1864.
6	*Bowers, A. M.*, Lieut., D, 15th S. C., age 25.	July 1, 2, '63.	Left; Chopart's. To prison Oct. 20, 1863; healed.	13	*Buzzard, A. W.*, Pt., E, 31st Virginia, age 43.	April 6, 7, '65.	Left; Chopart's. Released June 29, 1865; "muscles contracted, elevating heel."
7	Boyan, J., Pt., F, 6th N. Y. Heavy Artillery, age 28.	June 18, 18, '64.	Left; 5th toe and metatarsal; necrosis. Discharged January 20, 1865; pensioned.	14	Campbell, J., Corp'l, 8th Co., N. Y. S. S., age 24.	May 18, —, '64.	Right; 5th toe and metatarsal. Duty September 12, 1864.

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
15	Carlisle, J., Pt., H, 16th Vermont, age 22.	July 3, 3, '63.	Left; great toe and metatarsal. Discharged August 11, 1863.
16	Carroll, H. S., Serg't, D, 33d Missouri, age 20.	June 6, 6, '64.	Left; 2d, 3d, and 4th toes thro' metatarsals. Surg. A. T. Bartlett, 33d Missouri. Duty October 6, 1864; pensioned.
17	*Christian, W. T.*, Pt., G, 25th Ala., age 25.	Mar. 25, 25, '65.	Left; Lisfranc's. To Provost Marshal June 13, 1865.
18	Clark, H. W., Pt., H, 100th New York, age 30.	May 13, 13, '64.	Right; Chopart's; also amp. left ankle joint. Surg. M. S. Kittingir, 100th New York. Disch'd Dec. 13, '64. *Spec.* 2857.
19	Coan, N., Pt., H, 12th New Jersey, age 27.	May 5, 5, '64.	Left; 4th toe, mid. of metatarsal. Vet. Res. Corps June 19, 1865.
20	Coffin, I., Pt., D, 69th Pennsylvania, age 21.	June 22, 22, '64.	Left, Chopart's. Confed. surgeon. Disch'd June 27. 1865.
21	Collins, J., Pt., I, 20th Massachusetts, age 26.	Aug. 14, 15, '64.	Left; 1st, 2d, 3d, and 4th toes, portion of metatarsals. Surg. N. Hayward, 20th Mass. Discharged April 1, 1865.
22	Cornwell, N. S., Pt., C, 10th Mass., age 26.	May 5, 5, '64.	Left; Chopart's. Disch'd January 7, 1865.
23	*Cunningham, D. C.*, Pt., A, 5th Louisiana.	May 4, 5, '63.	Left; Chopart's. Surg.—Stricklen, C. S. A. Disch'd Nov. 6, '63.
24	Davis, J., Serg't, A, 12th Massachusetts.	Dec. 13, 13, '62.	Left; small toe and portion metatarsal. Disch'd March 27, 1863.
25	Davis, J. B., Pt., B, 105th Illinois, age 27.	June 7, 9, '64.	Left: 3d toe and portion of metatarsal. A. Surg. A. Waterman, 105th Illinois. Disch'd October 29, 1864; pensioned.
26	*Dunn, B.*, Pt., E, 3d North Carolina.	July 3, —, '63.	Left. Paroled September 23, '63.
27	Dyer, F. A. M., Pt., F, 1st West Va., age 35.	April 9, 10, '64.	Right; 4th toe and 1 inch metatarsal. Surg. P. Gardner, 1st Va. Cav. Duty Sept. 9, 1864.
28	Eddy, W. P., Pt., E, 1st Mass. H. Art'y, age 29.	May 19, 19, '64.	Right; Chopart's; no motion of os calcis. Disch'd July 22, 1864.
29	Elliff, W. W., Pt., G, 117th Illinois, age 24.	May 6, 6, '64.	Left; great toe and metatarsal. Duty July 14, 1864; pensioned.
30	[1]*Finnigan, P.*, Pt., F, 1st Battery.	June 2, 3, '64.	——; Chopart's. Surgeon C. B. Gibson, C. S. A. August 20, amp. leg. Transferred.
31	Fitzpatrick, M. C. (alias Coots, Pt., H, 2d N. Y. M. Rifles, age 44.	June 30, 30, '64.	Right; Chopart's. Disch'd April 1, 1865; "an excellent stump." Died Dec. 28, 1869; consumpt'n.
32	Forbes, W. E., Pt., H, 14th Indiana Battery, age 40.	Aug. 18, 18, '64.	Right; oval; 3d and 4th toes, portions of metatarsals. Recovery Nov. 4, 1864.
33	Franklin, J. W., Pt., B, 8th New York Cavalry, age 32.	June 18, 18, '63.	Left; Lisfranc's. Disch'd Dec. 12, 1863; "painful and difficult use of limb."
34	Fuller, H. D., Pt., F, 28th Iowa, age 16.	Oct. 19, 20, '64.	Left; Chopart's. Surg. J. W. H. Vest, 28th Iowa. (Also amp. arm.) Disch'd June 21, 1865; "better to have removed entire foot." *Spec.* 4226.
35	Galvin, D. G., Pt., G, 32d Mass., age 26.	May 5, 5, '61.	Left; 2d toe and metatarsal. Discharged April 1, 1865.
36	Garvey, P., Pt., E, 3d Infantry, age 21.	Dec. 13, 13, '62.	Right; 4th and 5th toes and metatarsals. Disch'd April 2, 1863; pensioned.
37	*Gay, S. J. J.*, Corp'l, H, 51st Georgia, age 21.	May 1, 2, '63.	Left; Chopart's.
38	Gillespie, C., Pt., F, 94th New York.	Mar. 13, 13, '65.	Left; Chopart's. Surgs. Humphrey and Ramsay. Disch'd May 29, '65; stump badly formed.
39	Gillon, J., Pt., F, 27th Ohio, age 22.	Aug. 4, 4, '64.	Left; Hey's. Discharged July 5, 1865.
40	Givens, W. W., Pt., D, 1st West Virginia Cav.	July 3, 3, '63.	Right; Chopart's. Discharged December 3, 1863.
41	Gohl, F., Pt., K, 8th Pennsylvania Cavalry, age 27.	April 5, 5, '65.	Right; Hey's; thro' metatarsals, near tarsal articulation. Disch'd September 23, 1865.
42	Graham, J., Pt., E, 2d Pa. Art'y, age 22.	June 18, 18, '64.	Left; 2d toe and portion metatarsal. Surg. G. T. Stevens, 77th N. Y. Disch'd Mar. 20, '65.
43	*Greyer, J.*, Serg't, G, 52d Virginia.	June 1, —, '64.	——; great toe at tarso-metatarsal articulation. Surgeon C. B. Gibson, C. S. A. Transferred.
44	Gunderman, S., Pt., F, 46th Pennsylvania, age 21.	June 20, 20, '64.	Right; Chopart's. Surg.—Payne. Disch'd March 6, 1865; "condition worse than if amp. in leg."
45	Hall, J. L., Lieut., L, 1st Mass. H. A., age 24.	June 16, 16, '64.	Left; 4th and 5th toes and metatarsals. Disch'd October 3, '64; pensioned.
46	*Hall, J. T.*, Pt., D, 1st Georgia, age 27.	Nov. 28, 29, '64.	Left; Chopart's. To Provost Marshal March 7, 1865.
47	Hand, E., Pt., K, 2d Michigan, age 18.	June 3, —, '64.	Right; great toe and metatarsal. Vet. Res. Corps March 4, 1865.
48	Harris, L., Pt., A, 100th Pennsylvania, age 18.	Mar. 25, 25, '65.	Right; Lisfranc's. Surg.—Davis. Discharged June 19, 1865.
49	*Harsey, W.*, Pt., G, 27th South Carolina, age 27.	Aug. 21, 21, '64.	Left; Chopart's. Furl'd March 17, 1865.
50	Hart, E., Pt., C, 8th Ohio, age 34.	June 22, 23, '64.	Left; Chopart's. Surg. J. L. Brenton, 8th Ohio. Disch'd January 25, 1865.

INTERMEDIARY AMPUTATIONS IN THE FOOT.—Two hundred and sixty-seven operations were followed by recovery in two hundred and forty-three, by death in twenty instances; the result in four cases was not recorded; the mortality rate therefore was 7.6 per cent. Fifty-two were amputations through the tarsal or metatarsal bones and two hundred and fifteen were ablations of the toes.

CASE 931.—Private C. Crandall, Co. K, 2d New York Artillery, aged 18 years, was wounded in the left foot, at Spottsylvania, May 18, 1864, and entered Carver Hospital at Washington six days afterwards. Surgeon O. A. Judson, U. S. V., reported: "Gunshot fracture of metatarsus. The injury was caused by a musket ball, which entered the space of the fifth metatarsal bone and emerged at the corresponding point of the second metatarsal bone. On May 29th partial amputation of the foot by Lisfranc's method was performed by Assistant Surgeon H. Allen, U. S. A. The case did remarkably well. By September 30th the stump had entirely healed but was still very tender, the patient being unable to stand on it." He was discharged from service December 12, 1864, and pensioned. He died May 12, 1867.

CASE 932.—Private *G. W. Leslie*, Co. E, 2d South Carolina Rifles, aged 23 years, was wounded July 8, 1863, by a conoidal ball, which fractured the first and second metatarsal bones of the left foot and produced great laceration of the soft parts. He was conveyed to Confederate hospital No. 9, at Richmond, where amputation by Chopart's method was performed on August 3d by Assistant Surgeon C. W. P. Brock, C. S. A. At the time of the operation the tissues were infiltrated and in a sloughing condition, and the patient was in a debilitated state, having suffered from angeioleucitis and erysipelas. Slight sloughing of the flaps followed, but by September 1st the stump was nearly healed. The patient recovered with a useful limb.

CASE 933.—Private S. Hacket, Co. F, 11th Pennsylvania Reserves, aged 25 years, was wounded in the right foot, at Fredericksburg, December 13, 1862, by a round ball, which entered the sole near the third metatarsal bone, passed through the tarsus, and was extracted just anterior to the internal malleolus. He was admitted to Lincoln Hospital, Washington, ten days after receiving the injury, and Chopart's amputation was performed the following day. The patient's complexion was yellowish, his pulse rapid, and the color of his tongue light red and smooth. On December 29th he had a chill and complained of pain in his hips. There had been a few discharges of laudable pus and the stump looked well. On January 3d an abscess, which had been forming for three days, was lanced and bled profusely. During this time the patient had been costive and continued icteroid, the conjunctiva being of a pearly whiteness and his pulse moderately rapid, full, and regular. The granulations of the sore were more eminent and were bathed in a not unhealthy pus. His tongue on this day was furrowed, and during the morning he had a slight chill. On January 6th he had three chills, and the stump was inactive, the pus being white and cheesy. The abscess over the malleolus was now better, but the patient's skin was very yellow, with a brown tinge; tongue pale; countenance anxious. During the next three days he had one or two chills each day, and by this time he had become very feeble and his mind was wandering somewhat; pulse very rapid. The stump did not look very badly, but some hardness was noticed along the track of the vessels. By January 11th he was wholly delirious, which continued for two days, when he recovered his consciousness. The left pupil was now more dilated than the right; the stump was looking well, but was more swollen than at first. After this he became extremely exhausted and died January 15, 1863. The autopsy showed much emaciation. On opening the chest a large cavity was found just above the right lung, the top of it being lined with a greyish pus. Pleurisy with firm attachments existed on the right side, and there was partial pneumonia in the posterior lobe. A mass of separating dead tissue partially occupied the excavated space in the upper and anterior portion. The walls were lined with a thick and cheesy pus. Partial pneumonia with small circumscribed collections of pus existed in the lower lobe of the left lung posteriorly, while in the upper lobe anteriorly and at the middle there was a sharp-edged and deep excavation having separated dead tissue in it. The spleen was attached by fibrinous adhesions to the surface of the diaphragm and contained small circumscribed collections of pus. The liver was large, heavy, and mottled, with a distinct rough feel; kidneys natural and a little pale; inguinal glands greatly swollen. There was also a deep abscess below the popliteal space and unconnected with the stump. The amputated portion of the foot (*Cat. Surg. Sect.*, 1866, *p.* 421, *Spec.* 4493) was contributed to the Museum by Assistant Surgeon G. M. McGill, U. S. A., who also recorded the history of the case.

TABLE C.

Summary of Fifty-two Intermediary Amputations in the Tarsal or Metatarsal Bones for Shot Injury.

[Recoveries, 1—36; Deaths, 37—51; Unknown, 52.]

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.	NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Albright, P. J., Corp'l, B, 110th Ohio, age 19.	July 9, 22, '64.	Right; great toe and half of metatarsal. Surg. G. S. Palmer, U. S. V. Disch'd Feb. 19, 1865.	5	Boger, J., Pt., A, 17th Infantry.	June 24, July 9, 1864.	Left (phagadenic); great toe, middle of metatar. A. A. Surg. J. T. Logan. Duty Mar. 9, 1865.
2	Anderson, F., Pt., H, 28th Penn., age 40.	May 25, June 9, 1864.	Left (exc. portion 3d met. bone); amp. 2d toe and metatar. A. A. Surgeon J. G. Harvey. V. R. C. March 29, 1865.	6	Burt, C. M., Pt., E, 141st New York, age 21.	Aug. 5, 17, '64.	Left; great toe thro' metatarsal. A. A. Surg. — Ward. V. R. C. March 10, 1865.
3	Baskett, J., Pt., G, 146th New York, age 37.	May 8, 25, '64.	Left; 4th toe and half of metatarsal. A. A. Surg. O. P. Sweet. Discharged July 6, 1865.	7	Chalton, X., Pt., E, 2d Cavalry, age 25.	May 31, June 4, 1864.	Right; 2d toe at tarso-met. artic. Surgeon A. F. Sheldon, U. S. V. Duty January 25, 1865.
4	Bender, J., Serg't, I, 15th Mass., age 23.	Sept. 17, 20, '62.	Right; Chopart's. Discharged February 28, 1863.	8	Clarkson, J. N., Pt., E, 93d Indiana, age 18.	June 10, 14, '64.	Right; 2d toe and metatar. Surg. J. G. Keenon, U. S. V. Duty March 22, 1865; pensioned.

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
9	Cox, S., Lieut., G, 4th N. Y. Heavy Artillery, age 23.	Aug. 25, 29, '64.	Left; little toe and metatarsal. Surgeon N. R. Moseley, U. S. V. Discharged January 18, 1865.
10	Crandall, C., Pt., K, 2d N. Y. Heavy Artillery, age 18.	May 18, 29, '64.	Left; Lisfranc's. Ass't Surg. H. Allen, U. S. A. Disch'd Dec. 12, 1864. Died May 12, 1867.
11	*Dotson, D. N.*, Serg't, K, 37th Tenn., age 24.	Nov. 30, Dec. 5, 1864.	Right; Chopart's. Surg. D. J. Roberts, 20th Tenn. To Provo. Marshal May 6, 1865.
12	Gelvair, W., Pt., C, 16th Penn. Cav., age 26.	Oct. 27, Nov. 15, 1864.	Right; 3d toe and lower third of metatarsal. Surg. N. R. Moseley, U. S. V. Duty April 20, '65.
13	George, J. H., Pt., I, 49th Illinois, age 20.	Jan. 13, 25, '64.	Right (gangrene); 2d and 3d toes and metatarsals. A. A. Surg. S. S. Jessop. Duty June 8, 1864.
14	Grimstead, R. T., Pt., I, 93d Indiana.	June 11, J'y –, '63.	Left; 2d toe and metatarsal. Discharged Dec. 28, 1863.
15	Green, A., Pt., D, 8th N. Y. Artillery, age 30.	June 23, July 18, 1864.	Right; Lisfranc's. A. A. Surg. D. G. Caldwell. Disch'd Sept. 27, 1864.
16	Hansmeier, A., Pt., A, 114th Illinois, age 19.	June 10, 13, '64.	Right; Lisfranc's. Discharged June 20, 1865; painful, tender cicatrix.
17	Hefferman, P., Pt., F, 14th Infantry, age 20.	Aug. 30, Sept. 9, 1862.	Left; Chopart's. Confed. surgeon. Heel drawn up. Oct. 8, 1863, amp. leg. Disch'd May 17, '64.
18	Kelton, W., Pt., H, 3d Vermont, age 23.	May 6, 13, '64.	Right; 1st toe and metatarsal. Vet. Res. Corps Nov. 25, 1864.
19	Keyes, C. W., Lieut., E, 32d Maine, age 33.	May 12, June 8, 1864.	Left (gang). Dr. P. Dyer, Wilton, Me. Gang. June 12, 1864, amput'n leg. App't in U. S. A. Retired December 31, 1870.
20	Knowlton, D., Serg't, M, 1st Maine H'vy Artillery, age 19.	June 18, July 5, 1864.	Left; 4th toe and half of metatarsal. A. A. Surg. F. B. Greenough. Disch'd March 27, 1865.
21	Lackey, G. H., Serg't, D, 58th Mass., age 24.	May 12, 27, '64.	Left; 1st toe and metatarsal. A. A. Surg. J. C. Nelson. Erysip.; gangrene. July 27, amp. leg. Disch'd March 16, 1865.
22	Landenberger, F. D., Pt., B, 6th Penn. Cavalry, age 57.	Mar. 18, 24, '64.	Right; 2d toe and metatar. Ass't Surg. J. W. Williams, U. S. A. Discharged Sept. 3, 1864.
23	*Leslie, G. W.*, Pt., E, 2d S. Carolina, age 23.	July 8, Au. 3, '63.	Left; Chopart's. Ass't Surg. C. W. P. Brock, C. S. A. Recovery.
24	Little, D. H., Pt., G, 138th Penn., age 20.	Nov. 27, Dec. 9, 1863.	Right; great toe and metatarsal. Surg. E. Bentley, U. S. V. Discharged Feb. 27, '64; pensioned.
25	London, J. C., Pt., C, 90th Penn., age 28.	Nov. 27, De. 15, '63.	Left; 4th toe and metatarsal. Transferred May 30, 1864.
26	Lovelady, A., Pt., A, 4th Iowa Cav., age 22.	June 10, July —, 1864.	Right (gangrene); great toe and metatarsal. A. A. Surg. Sharpe. Disch'd March 29, 1865.
27	Lynch, A., Pt., C, 29th Pennsylvania, age 39.	May 25. June 1, 1862.	Right; Hey's. Confed. surgeon. Disch'd March 16, 1863; good stump.
28	McCarty, J., Pt., F, 48th New York, age 38.	Mar. 2, 21, '64.	Right; Chopart's. A. A. Surg. C. T. Reber. (Mar. 2, lig. post. tibial; gang.) Mar. 23, bones removed; April 25, 1865, amp. leg. Disch'd June 10, 1865. Died Dec. 19, 1874. *Spec.* 3007.
29	Madison, J., Pt., C, 9th Minn., age 48.	July 16, 23, '64.	Right; 2d toe and part of metatarsal. Surg. J. G. Keenon, U. S. V. Disch'd May 26, 1865.
30	Marshall, J. S., Pt., B, 131st Co., 2d Bat. V. R. Corps, age 29.	July 2, 20, '63.	Right; toe at middle of metatarsal. A. A. Surg. J. A. Buchanan. Duty May 21, 1864.
31	Mendenhall, A., Corp'l, H, 39th Illinois, age 38.	Aug. 14, 24, '64.	Left; toe and metatarsal. A. A. Surg. R. O. Sidney. Disch'd April 4, 1865.
32	Quade, C. H., Pt., F, 8th N. Y. Heavy Artillery, age 17.	June 22, July 16, 1864.	Left (erysip.; gang.); 4th and 5th toes and metatar. A. A. Surg. A. Trau. Disch'd Feb. 18, 1865; pensioned.
33	Rooney, A., Pt., F, 40th New York, age 29.	Aug. 29, Sept. —, 1862.	Right; Lisfranc's. Surg. D. W. Bliss, U. S. V. Disch'd May 20, 1863. 1879, stump healthy.
34	Shearer, A., Pt., A, 6th Colored Cavalry, age 25.	De.—, '64, Jan. 8, '65.	Left; thro' ant. part cuboid and cuneiform bones. Discharged June 12, 1865.
35	Snyder, B., Pt., F, 129th Pennsylvania, age 24.	May 7, 15, '64.	Left (gang.); 4th toe at middle of metatar. Surg. A. F. Sheldon, U. S. V. Disch'd May 26, 1865.
36	Watson, J. H., Serg't, G, 121st Peno., age 22.	May 10, 21, '64.	Left; 2d and 3d toes and metatarsals. Surg. E. Bentley, U. S. V. Duty January 30, 1865.
37	Barnes, M., Pt., D, 28th Mass., age 34.	June 4, —, '64.	Right; 3d toe and metatarsal. A. A. Surg. J. G. Nelson. Died July 6, 1864; dysen. and w'nd.
38	*Bell, R. A.*, Pt., A, 14th Virginia.	May 10, 19, '64.	Left; Chopart's. Surgeon C. B. Gibson, C. S. A. Died May 27, '64.
39	Brooks, T. M., Pt., C, 124th N. York, age 19.	Nov. 27, Dec. 8, 1863.	Left; 3d and 4th toes and metatarsals. Surg. E. Bentley, U. S. V. Died Dec. 20, '63; pyæmia.
40	Decay, S., Corp'l, A, 179th New York, age 35.	June 11, 30, '64.	Right; 1st toe and metatarsal. A. A. Surg. J. G. F. Strowbridge. Pyæmia. Died July 29, 1864; excessive suppuration.
41	Graham, P., Corp'l, K, 26th Ohio.	Sept. 19, 25, '63.	Right; Chopart's (also ex. elbow). Died Oct. 8, 1863.
42	Hackett, S., Pt., F, 111th Penn. Reserves.	Dec. 13, 24, '62.	Right; Chopart's. Ass't Surg. G. M. McGill, U. S. A. Died Jan. 15, 1863; pyæmia. *Spec.* 4493.
43	King, E., Pt., B, 1st Vermont Cavalry, age 18.	Aug. 25, 30, '64.	Right; 1st toe and metatarsal and 3d toe thro' 3d phalanx. A. A. Surg. W. J. McIlench. Died Sept. 11, 1864; pyæmia.
44	King, S., Serg't, C, 9th West Va., age 23.	July 20, 25, '64.	Right; 2d toe and part of metatarsal. Died Aug. 3, 1864.
45	Linville, A. J., Pt., G, 44th Illinois, age 18.	Oct. 30, Nov. 12, 1864.	Left; Chopart's. A. A. Surg. — Bell. Died Feb. 10, 1865; exhaustion.
46	Lumbard, M., Pt., D, 15th Ohio.	Sept. 20, Oc. 10, '63.	Left; Chopart's. Died November 24, 1863.
47	Mockler, W., Pt., G, 81st Pennsylvania, age 47.	Dec. 13, 26, '62.	Right; Chopart's. Dec. 31, hæm. Died January 10, 1863.
48	*Nash, J.*, Pt., C, Maryland Battalion.	July 3, 14, '63.	Left; tetanus. Died July 16, 1863.
49	Schmidt, J., Pt., C, 102d Penn., age 29.	June 5, 25, '64.	Left; great toe and metatarsal. Surg. H. Palmer, U. S. V. Died June 27, 1864; inflam. liver.
50	Smith, B. J., Pt., I, 14th N. Y. H. Art'y, age 28.	June 1, 12, '64.	Right. Died, in Libby Prison, July 3, 1864.
51	Whistler, A. W., Pt., I, 54th Pennsylvania.	June 5, 22, '64.	Left. Ass't Surg. H. Grumbine, 20th Penn. Cav. Died August 16, 1864; gangrene and hæm.
52	*Moore, G. M.*, Pt.,—, 28th N. Carolina, age 17.	Aug. 25, 31, '64.	Left; Chopart's. Surg. D. F. Wright, C. S. A.

SECONDARY AMPUTATIONS IN THE FOOT.—Of ninety-four secondary operations ninety-two were successful and two fatal, a mortality rate of 2.1 per cent. Seventy-six were ablations of the toes, eighteen amputations in the tarsal or metatarsal bones.

Case 934.—Private E. McEntee, Co. B, 73d New York, aged 23 years, was wounded in the right foot, at Gettysburg, July 2, 1863, and entered Jarvis Hospital, Baltimore, eight days afterwards. Upon examination a compound comminuted fracture of the tarsal articulation was found, with a musket ball lodging in the foot. Efforts were made to save the limb; but a high degree of suppurative inflammation set in, when it was decided to amputate, and Chopart's operation was performed on August 4th by Assistant Surgeon D. C. Peters, U. S. A. The patient recovered, and was discharged from service December 16, 1863, and pensioned, the stump, though healed, remaining tender and giving indications of remaining unserviceable for a long time, thereby unfitting him for duty in the Invalid Corps. Part of the amputated foot, exhibiting a great effusion of callus and showing necrosis in the track of the missile, was contributed to the Museum, with the history of the case, by the operator, and constitutes specimen 1650 of the Surgical Section. The pensioner was paid September 4, 1880. In his application for commutation, dated 1870, he described the condition of the stump as still "very tender;" but in subsequent statements he reported it as "pretty good" and "healthy."

Case 935.—Lieutenant H. Holt, Co. F, 30th New York, aged 20 years, was wounded in the right foot, at Bull Run, August 30, 1862. Surgeon C. L. Allen, U. S. V., described the injury as follows: "The ball entered at the top of the foot, fracturing the fifth metatarsal bone, and was cut out on the field from the sole of the foot. He went on horseback to Centreville, where during the afternoon of the following day he was placed in an ambulance. The next day he came to Washington, taking

the cars at Fairfax Station and entering Emory Hospital for a day or two, when he removed to a private boarding-house and was attended by a private physician. On September 28th, foot was swollen; abscesses opened, and the original wounds were all discharging freely. The patient was much emaciated, his countenance expressing suffering and showing the strongly marked hectic flush; appetite gone; thirst considerable; pulse 130, feeble and fluttering; pain and stiffness in the jaws, with inability to open the mouth more than to admit the tip of the little finger between the teeth. This condition (trismus), he stated, had been coming on for two or three days. Huxham's tincture, brandy, beef-essence, etc., with an occasional full dose of morphia was prescribed. On October 5th another abscess opened. October 9th: The patient has slowly and steadily improved in general appearance since my first attendance; pulse 110 to 116 with more strength. It was thought advisable to put the patient under the influence of ether and examine and perform any operation considered necessary, Surgeons M. Clymer and J. H. Brinton, U. S. V., being requested to see the case. The foot was still enormously swollen, and the probe passed readily from the wound of entrance to the opening below the external malleolus. In the upper opening four inches above the inner malleolus the probe rapped distinctly upon the denuded tibia. Surgeon Clymer made an incision nearly the whole length of the external side of the foot, and removed the fragments of the fifth metatarsal bone together with the little toe. Since it appeared at this stage that all or nearly all the tarsal and metatarsal bones were diseased, as well as the lower third of the tibia, it was decided that amputation was necessary, but that the patient at this time could not endure any further operation. The tonics, stimulants, and nourishments were now crowded as much as possible. On October 12th the patient had somewhat improved. On the following day tincture of cantharides, in doses of twenty drops every four hours and to be increased if necessary, was prescribed in addition to his other treatment. For three or four days the patient steadily but very slightly improved, after which he evidently failed for a few days. He had taken nearly two ounces of tincture of cantharides and suffered a little of strangury. All remedies except his nourishment and a little brandy were now omitted, and on the following day compound syrup of phosphate of lime and iron was ordered. On October 23d the patient was still very feeble, but looked a little brighter and had a little appetite; pulse 120 to 130. After this he steadily improved, and by November 1st he had a good appetite, his pulse having gradually lessened to from 80 to 90 per minute. On November 8th he was dressed and able to sit in a chair, and about two weeks later he first went down stairs on crutches. The wounds on the external side of the foot had completely healed by December 21st, while the openings on the other side, both above and below the malleolus, were still discharging. All the openings healed up about December 31st, but several days after more swelling appeared toward the toes, and on January 3d an opening occurred over the second metatarsal bone, near the distal extremity. This discharged freely for several weeks, denuded bone being detected by the probe. On January 29th the patient was able to wear his boot all day, and one week afterwards he walked with a cane. By February 15th the last opening had closed. On March 13, 1863, the patient was mustered out of service, walking with ease by the aid of a cane and without much difficulty without one. He subsequently informed me by letter that he was holding a position on the staff of Brigadier General Pierce in Massachusetts." Lieutenant Holt is a pensioner, and was paid February, 1879.

TABLE CI.

Summary of Eighteen[1] Cases of Secondary Amputations in the Tarsal or Metatarsal Bones for Shot Injury.

[Recoveries, 1—16; Deaths, 17—18.]

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.	No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1	Carey, J., Pt., E, 149th Penn., age 23.	May 5, June 11, 1864.	Right; 4th toe and metatarsal. Surg. H. Palmer, U. S. V. Discharged July 24, 1865.	10	Noll, E., Pt., G, 147th Penn., age 22.	May 25, Aug. 13, 1864.	Right; 2d toe and portion of metatarsal. A. A. Surg. J. O. Connell. Disch'd Sept. 22, 1865.
2	Finnegan, P., Pt., H, 16th Infantry, age 34.	De.31,'62, Feb. 27, 1865.	Right. Dr. J. E. Pomfret. (Discharged Feb. 21, 1865; ch. erysipelas of foot.) Feb. —, 1866; amputation lower third leg.	11	Palmer, A. G., Pt., D, 4th New York Heavy Artillery, age 21.	May 23, 1864, Jan. 10, 1865.	Left (May 29, 3d and 4th toes; amp.; necrosis); part of 4th and 5th metatarsals. A. A. Surg. D. F. Etter. Disch'd May 30, '65.
3	Foss, G. P., Serg't, K, 1st Mass. Heavy Artillery, age 46.	June 18, Sept. 14, 1864.	Left; 4th toe and metatarsal. A. A. Surg. J. H. Cushing. Disch'd June 26, 1865.	12	Strong, A., Pt., E, 24th Wisconsin, age 24.	J'y 2, '63, Jan. 20, 1864.	Left; 1st toe and part of metatarsal. Surg. E. B. Wolcot, Wisconsin. Disch'd Oct. 14, 1864.
4	Haslam, J., Pt., H, 120th Penn., age 30.	De.13,'62, Feb. 18, 1864.	Right; great toe and part of metatarsal (gangrene; March, 1863, excis. 2d toe); Nov. 17, 1867, amp. leg; June, 1868, amputat'n upper third leg.	13	Titus, A., Serg't, E, 3d Wisconsin, age 28.	Aug. 9, De. 6, '62.	Left; Lisfranc's. Disch'd Nov. 14, 1862; necrosis.
				14	Tooley, F., Pt., D, 103d New York, age 22.	De.16,'62, May 30, 1863.	Right; 2d and 3d toes and metatarsals; hæmorrhage. Disch'd Sept. 12, 1863.
5	Leimond, H., Pt., E, 28th Mass., age 37.	J'y30,'64, Feb. 28, 1865.	Right; 4th toe and part of metatarsal. A. A. Surg. J. H. Cutler. Disch'd July 31, 1865.	15	Williams, S.W., Pt., Andrew's S. S. (Mass.), age 31.	Sept. 17, 1862, Jan. 17, 1863.	Left; Hey's; through metatarsals just ant. to tarsal articulation. Surg. J. Nicll, U. S. V. Disch'd April 17, 1863; depending on crutches.
6	McEntee, E., Pt., B, 73d New York, age 23.	July 2, Aug. 4, 1863.	Right; Chopart's. Ass't Surg. D. C. Peters, U. S. A. Disch'd Dec. 16, 1863. *Spec.* 1650.	16	Wither, C. E., Corp'l, B, 7th Maine, age 23.	May 4, J'e 21,'63.	Left; 1st toe and metatar. Duty.
7	McMorran, S. T., Capt., C, 66th Ohio, age 32.	Aug. 9, Oct. —, 1862.	Left; 3d and 4th toes and metatarsals. Disch'd Jan. 27, 1863; pensioned.	17	Gilman, C. F., Pt., E, 3d Maine, age 24.	May 8, June 22, 1864.	Right; Hey's. A. A. Surg. G. E. Brickett. (Amp. toe; gangrenous.) Died June 30,'64; dipthe.
8	Merrill, M., Pt., K, 12th Maine, age 33.	Oct. 19, Dec. 19, 1864.	Right; 3d toe thro' metatarsal. A. A. Surg. Trau. Duty July 27, 1865.	18	Ryan, A., Pt., C, 114th New York, age 28.	Nov. 5, 1864.	Left; Hey's. Surg. C. T. Simpers, 6th Md. Died Nov. 9, 1864; pneumonia.
9	Meyers, J. J., Pt., K, 102d Illinois, age 33.	June 22, Sept. 7, 1864.	Right; 1st and 2d toes and portions of metatarsals. Disch'd April 4, 1865.				

AMPUTATIONS IN THE FOOT OF UNCERTAIN DATES.—In four hundred and seven instances of amputations in the foot the time between the injury and the operation was not indicated.

[1] As in the preceding two tables, amputations of the toes are not included in this table.

The results in fifty-four cases were not ascertained; three hundred and twenty ended in recovery and twenty-three in death, a mortality rate of 6.5 per cent. Sixty cases were amputations in the tarsal or metatarsal bones; three hundred and forty-seven were amputations of the toes. Few details of the cases were reported.

CASE 933.—Corporal G. Marsh, Co. G, 17th Iowa, aged 25 years, received a shot wound of the right foot, at Champion Hills, May 16, 1863, and was conveyed to Gayoso Hospital, Memphis, two weeks afterwards. After some time had elapsed in an attempt to save the whole foot an operation was resorted to which involved the four small toes and metatarsal bones. The wound healed kindly, and the patient recovered with a comparatively useful foot. The case was reported by Surgeon J. Bryan, U. S. V.[1] The patient was subsequently transferred to Jefferson Barracks, where he was discharged from service October 6, 1863, and pensioned. Examining Surgeon J. Windle, of Des Moines, Iowa, certified to the loss of the four small toes and metatarsal bones, "leaving the big toe greatly deformed, the ankle-joint stiff, and the muscles on the sole of the foot contracted so that the toe touches the ground first and causes him to walk with difficulty. The limb is considerably wasted and weak." The pensioner was paid September 4, 1881.

TABLE CII.

Summary of Sixty Cases of Amputations in the Tarsal or Metatarsal Bones of Uncertain Date for Gunshot Injury.

[Recoveries, 1—32; Deaths, 33—49; Results unknown, 50—60.]

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	*Aikins, J. T.*, Pt., A, Phillip's Legion.	May 3, —, '63.	——; Chopart's. Furloughed.
2	*Barnes, J. G.*, Pt., B, 38th Va. Art'y, age 19.	April 18, —, '64.	Left. Retired March 22, 1865.
3	*Berry, H. T.*, Pt., H, 6Cth Alabama.	———	Right; great toe and metatarsal. Furloughed August, 1864.
4	Bisbee, N., Serg't, K, 89th New York, age 43.	June 18, 1864, ———	Right; toes and 3d metatarsal; April, 1865, amput'n leg. Discharged May 25, 1865.
5	*Blevins, F.*, Pt., A, 26th North Carolina.	J'y 3, '63, ———	Right; Chopart's. Retired February 3, 1865.
6	*Buck, C. N.*, Pt., B, 17th Virginia, age 19.	Aug. 3, —, '62.	——; Chopart's. Furlough'd September 15, 1862.
7	*Burnett, W. B.*, Lieut., G, 10th Arkansas.	——— 1863.	——. To custody of Provost Marshal.
8	*Collins, W. A.*, Pt., F, 63d Tenn., age 31.	——— J'y31,'64.	——; 4th toe and metatarsal; necrosis. Recovery.
9	*Denham, G. D.*, Corp'l, B, 15th Alabama.	Sept. 20, —, '63.	Left. Furloughed Oct. 3, 1864.
10	*Gaspar, J.*, Pt., H, 8th Louisiana.	J'y 3, '63, ———	Left. Discharged November 19, 1863.
11	*Gleason, J.*, Pt., D, 7th N. C., age 42.	Dec. 14, —, '62.	Right; Chopart's. Duty Nov. 4, 1863.
12	*Hardy, R. F.*, Pt., C, 38th Va., age 24.	July 3, —, '63.	Left; Chopart's; gangrene. Exchanged March 17, 1864.
13	*Harvey, S.*, Pt., A, 2d South Carolina.	——— 1863.	Left. Sent to Nashville.
14	*Hickman, J. W.*, Pt., B, 2d Louisiana.	———	Left. Discharged January 23, 1863.
15	Holmes, G. W., Pt., F, 73d Ohio, age 36.	Dc.28,'64, ———	Left; great toe and half of metatarsal. Disch'd May 9, 1865.
16	Ingle, W. F., Serg't, A, 2d Ind. Cav., age 21.	Jan. 27, —, '64.	Left: Lisfranc's. Disch'd October 4, 1864.
17	Johnson, G. N., Serg't, B, 154th New York.	——— Aug.9,'63.	Right; great toe and metatarsal. Recovery.
18	*Johnson, T. T.*, Pt., K, 59th Georgia.	July 3, —, '63.	Right. Paroled September 23, 1863.
19	*McDonnell, C.*, Pt., C, 6th North Carolina.	July 3, —, '63.	——. Paroled September 12, '63.
20	Marsh, G., Corp'l, G, 17th Iowa, age 25.	M'y16,'63. ———	Right; four small toes and metatarsals. Disch'd Oct. 6, 1864.
21	*Miller, M.*, Pt., G, 10th Louisiana.	July 2, —, '63.	Left; Chopart's. Furloughed.
22	*Morrison, J. G.*, Aide-de-Camp to General T. J. Jackson.	———	——; Chopart's. Recovery.
23	*Patrick, W. A.*, Pt., F, 16th Georgia.	July 3, —, '63.	——. Paroled August 22, 1863.
24	*Rogers, J.*, Pt., B, 44th North Carolina, age 23.	Oct. 14, —, '63.	Left: Chopart's. Retired February 14, 1865.
25	Shaw, L., Pt., K, 6th Vermont, age 41.	April 2, 1865, ———	Right; 1st toe at scaphoid, 2d toe and metatarsal. Disch'd Aug. 11, 1865; pensioned.
26	*Simms, W. E.*, Serg't-Maj., 24th Miss., age 22.	Se.13,'64, ———	Right; 2d toe and metatarsal. Transferred Oct. 27, 1864.
27	*Slaughter, D. W.*, Pt., K, 18th Georgia.	——— 1862.	Right. Discharged December 1, 1862.
28	Smithers, B. G., Corp'l, C, 11th Mass.	——— Au. 2, '63.	Right; great toe, excision 1st and 2d metatarsals. Recovery.
29	Sowle, H., Pt., F, 37th Illinois.	———	——; 5th metatar. Ass't Surg. J. Murphy, 37th Ill. Duty May 5, 1863. Died September, 1864.
30	Tedrick, W. L., Pt., F, 149th Penn., age 21.	M'y 5,'64, ———	Left; toe and 2d metatar. Discharged February 10, 1865.
31	*Tilty, J.*, Lieut., E, 34th North Carolina.	July 3, —, '63.	Right; Chopart's. Paroled Oct. 24, 1863; exchanged.
32	*Weinkler, F. E.*, Pt., C, 6th Louisiana.	July —, —, '63.	——. Transferred.
33	Becker, F., Pt., G, 32d Indiana.	De.31,'62, ———	——. Died January 21, 1863.
34	*Colgan, J. A.*, Corp'l, D, 14th South Carolina.	——— 1864.	Right. Died September 13, 1864.
35	Crockett, W., Pt., B, 19th Maine.	May 6, —, '64.	Right. Died June 8, 1864.
36	*Davis, B. M.*, Pt., B, 20th Georgia.	——— 1862.	——. Died September 12, 1862.
37	*Esley, J. A.*, Pt., C, 18th Georgia.	——— 1862.	——. Died September 11, 1862.
38	Freeman, C. D., Pt., F, 4th Massachusetts.	June 14, —, '63.	Left. Died July 17, 1863.
39	Furry, E. M., Serg't, G, 73d Ohio.	Aug. 31, —, '62.	——. Died September 23, 1862.
40	*Gordon, V.*, Corp'l, K, 55th Virginia.	——— J'y31,'62.	Right (gangrenous); erysipelas. Died August 4, 1862.
41	Greenwood, E. W., Pt., G, 53d Mass.	June 14, —, '63.	——. Died July 6, 1863.
42	*Hoffman, A.*, Aide-de-Camp to Gen. Trimble.	——— 1863.	——. Died August 10, 1863.
43	*Hunnicutt, J. B.*, Pt., G, 12th South Carolina.	——— 1864.	Left. Died June 27, 1864.
44	*Mitchell, W.*, Pt., E, 25th Virginia.	——— 1862.	Right. Died July 24, 1862.
45	Rowland, S., Serg't, A,	May 3,	Both. Died June 6, 1863.
46	78th New York.	—, '63.	
47	Stuart, J. W., Pt., I, 9th Iowa.	Mar. 7, —, '62.	Left. Died May 6, 1862.
48	*Wooden, A.*, Pt., E, 21st Virginia.	——— 1863.	——. Died July 1, 1863.
49	Wooding, H., Serg't, I, 24th Connecticut.	May 24, —, '63.	——. Died July 23, 1863; diarrhœa.
50	*Cannady, J. W.*, Pt., I, 3d South Carolina.	July 3, —, '63.	——.
51	*Colley, T. W.*, Serg't, D, 1st Virginia Cavalry.	——— 1864.	Left.
52	*Garrison, F. M.*, Pt., I, 13th Alabama.	———	Left; great toe at tarso-metatarsal articulation.
53	*Greenwood, A.*, Pt., C, 55th Virginia.	———	Right; two toes and portions of metatarsals.
54	*Hendrix, G. A.*, Pt., E, 2d South Carolina.	——— 1864.	Right.
55	*Herron, D. E.*, Pt., I, 42d Georgia.	——— 1865.	Right.
56	*Knight, R. H.*, Pt., K, 45th Georgia.	——— 1865.	Left.
57	*Landing, J. F.*, Pt., A, 38th North Carolina.	——— 1863.	——.
58	*Lindsay, A. T.*, Pt., F, 6th South Carolina.	——— 1864.	Left.
59	*Linsbay, A. L.*, Pt., E, 60th Alabama.	———	Right; 2d toe and part of metatarsal.
60	*Powell, R. B.*, Lieut., C, 2d South Carolina.	Oct. 3, —, '64.	Left.

[1] BRYAN (JAMES), *Seventeen Additional Cases of Amputations from the Armies of the South-West*, in *Am. Med. Times*, Volume VII, p. 287.

Concluding Observations.—Less frequent than the shot lesions of the bones of the hand, the shot fractures of the bones of the foot were found more vexatious,[1] not rarely leading to extensive inflammation and accumulations of pus under fascia and tendons, and to tedious exfoliations of fractured bones; and the percentage of fatality of the injuries of the foot considerably exceeds that of the injuries of the hand, the former being 8.3, the latter only 3.1 per cent. In many of the cases of fractures of the tarsal bones detailed on pages 619 to 622, the wounds suppurated for months and even years. In the case of Campbell (CASE 896, page 619, *ante*), who was shot through the tarsal bones in July, 1861, the pension examiners testified in 1874 that the wound was still open and connected with dead bone; and, in 1875, that a portion of the astragalus had been removed. In the case of Tarrance (CASE 892, page 619, *ante*), who received a shot fracture of the os calcis in 1863, necrosed bone was removed with the gouge six months after the injury, and the wound was yet suppurating in 1866. In other cases, although the wounds closed, the limbs remained of little service. In Chase's case (CASE 897, page 620, *ante*) the foot is turned inward and upward, the leg resting on the outside of the foot, and the patient cannot get along without an artificial apparatus. Flattening of the plantar arch was recorded in the case of Miller (CASE 893, page 619, *ante*), anchylosis of the ankle joint in the case of West (CASE 899, page 620, *ante*), and swelling of the ankle and leg to the knee with disease of the tibia and soft parts in the case of Captain Bearden (CASE 898, page 620, *ante*), who either has to use crutches or a stout cane at all times to walk.

The treatment generally consisted in the application of cold-water dressings or of poultices.[2] Of the grave surgical complications, pyæmia was noted in fifteen cases, all fatal; tetanus in fourteen, with two recoveries, twelve deaths; gangrene in thirty-seven, with thirty recoveries, six deaths, one unknown result; erysipelas in twenty-three, with twenty recoveries, three deaths; and hemorrhage in twenty-three cases, with nineteen recoveries, three deaths, and one unknown result.

Excisions in the bones of the foot for shot injuries are of very recent date. The operations ascribed by Velpeau[3] and Heyfelder[4] to Formey[5] in the sixteenth century and to

---

[1] RAVATON (*Chirurgie d'armée ou traité des plaies d'armes à feu, etc.*, Paris, 1768, p. 389): "Les coups de feu qui fracturent les os du pied sont très fâcheux: on peut les distinguer en ceux qui percent le pied suivant sa longueur d'arriere en avant, ou de devant en arriere; en ceux qui le percent de côté, plus ou moine obliquement: en ceux qui ont leur entrée sur le col du pied, et leur sortie au talon, et par la route la plus courte au tarse, au métatarse en fracturant les os des doigts. Toutes ces différentes fractures sont toujours accompagnées de lésion de tendons, et c'est la multitude de ces mêmes tendons qui aggrave la maladie." NEALE (H. ST. JOHN) (*Chirurgical Institutes, etc.*, London, 1805, 2nd ed., p. 256): "Gunshot wounds of the tarsus, when the bullet remains in its substance, or when it has pierced quite through, are much more dangerous than those of the wrist; and many reasons may be given for this. First, the bones of the tarsus are larger than those of the wrist, and of consequence a greater havock is occasioned here; secondly, the tendinous parts that cover these bones and tie them together are larger and more numerous. Thus the nervous system suffers more in the injury. Thirdly, the conjoined group of bones in the tarsus form a much thicker body, and therefore we cannot reach them with our incisions to the bottom of the wound, as in the soft fleshy parts. These wounds should therefore be regarded as being of very great consequence, and even it may be said of as great importance as those that pierce a joint quite through." PORTER (J. B.) (*Medical and Surgical Notes of Campaigns in the War with Mexico, etc.*, in *Am. Jour. Med. Sci.*, 1852, Vol. XXIII, p. 30): "Wounds of the foot and leg do not, by any means, recover so readily or so perfectly as wounds of the hand and forearm." PIROGOFF (N.) (*Grundzüge der Allgemeinen Kriegschirurgie*, Leipzig, 1864, p. 823): "With a wound of the foot the case is different from a wound of the hand. The patient with a wounded hand can stand and go about, and during fair weather can remain in the fresh air the whole day. In shot wounds of the foot on the contrary the patient is confined for half a year or a year to his bed at the hospital, and, in the end, the foot preserved is so crippled that he must have recourse to crutches." THOMSON (J.) (*Report of Observations, etc., after the Battle of Waterloo*, Edinburgh, 1816, p. 144): "Various instances presented themselves of gunshot wounds of the foot. In some of these the balls had passed between the soft parts and the bones on the under as well as upper part of the foot. In other instances the balls had passed through the foot in every direction and had fractured the tarsal and metatarsal bones. These fractures were always accompanied with great swelling, which depended on the communication of inflammation from the wound to the contiguous ligaments and articulating surfaces." GUTHRIE (G. J.) (*Treatise on Gunshot Wounds*, London, 1827, p. 412): "The feet generally suffer from wounds of musket balls; and as the parts in the foot, although bearing a general resemblance to the hand, are more complex and difficult of management, so are wounds of the foot more dangerous and more generally followed by defective cures from apparently slighter causes."

[2] STROMEYER (L.) (*Maximen der Kriegsheilkunst*, Hannover, 1855, p. 748) warns against the too early application of cataplasms in fractures of the tarsal bones; but advises their application in fractures of the metatarsal and phalangeal bones, as the cold applications are apt to become harassing.

[3] VELPEAU (A.-A.-L. M.), *Nouveaux éléments de médecine operatoire*, Paris, 1839, T. II, p. 660.

[4] HEYFELDER (O.), *Lehrbuch der Resectionen*, Zweiter Abdruck, Wien, 1863. p. 194.

[5] RIVERIUS (L.) (*Opera Medica Universa*, Lugduni, 1679, p. 571, Obs. XIII) cites a case of shot wound of the calcaneum; the ball had lodged in the calcaneum and was removed by FORMEY with the aid of a trephine: "trepano calcaneum aperui, et in eo latentem globulum inveni et extraxi."

Morand[1] in the seventeenth, were certainly not excisions, but simply extractions, by the aid of the trephine, of missiles lodged in the calcaneum. An excision of four metatarsals and the cuneiform bone, performed by Langenbeck in 1848, in the Schleswig Holstein war, seems to have been the first operation of this nature for shot injury; and since then only a few cases of excisions of the tarsal or metatarsal bones can be traced,[2] as the surgical histories of the late great European wars barely mention these cases, or include them, without comment, in the tabular statements of operations of the foot and toes.

As indicated in Table XCVI, page 622, the excisions in the tarsal bones had a fatality of 16.6 per cent., in the tarso-metatarsal articulation of 40.0 per cent., in the metatarsal bones of 14.8 per cent., and in the metatarso-phalangeal articulation of 75.0 per cent., making in the aggregate number of cases a mortality of 19.3 per cent., which slightly exceeds that of the partial amputations of the foot, viz: 18.9. The unfavorable results, especially in the cases in which the tarso-metatarsal or the metatarso-phalangeal articulations were involved, were found to be due to inflammation of the synovial membranes and the ease with which purulent suppuration extended through the spaces between the adjacent bones. The usefulness of the limb remained largely impaired in nearly all the patients who submitted to this operation. In the case of General Badeau, in which the middle and portion of the internal and external cuneiforms were removed, the arch of the foot remained depressed,[3] and the operation tended slightly to valgus. In Dubois' case (CASE 909, page 623, *ante*), the pension examining surgeons testify to lameness, and much pain and difficulty in walking; and in Hargrave's case (CASE 916, page 624, *ante*) it is reported that he was never able to walk without crutches. In the case of Leunze (CASE 911, *ante*), in which the first metatarsal was removed in 1864, the great toe had become distorted in 1868 and was pushed at least one inch posterior to its original locality; the weight of the body in walking was sustained by the heel and a portion of the external border of the foot.

Amputations in the Foot.—Amputations were performed in every part of the foot as was deemed necessary from the nature of the injury, thus causing a series of operations

---

[1] MORAND (*Opuscules de Chirurgie*, Paris, Seconde Partie, 1772, p. 248): "J'ai vu des balles enclavées dans les os, et entré autres une dans le calcaneum qui ne put être tirée que par l'application du trepan, en l'embrassant dans le cercle de la comonne."

[2] ROSS (G.) (*Militairärztliches aus dem ersten Schleswigschen Feldzuge im Sommer*, 1848, Altona, 1850, p. 56): L——, shot at Düppel, June 5, 1848; ball entered the dorsum of the foot, fractured the metatarsals, and escaped at the sole of the foot; June 15, excision of the four inner metatarsals by LANGENBECK; gangrene; June 16, amputation in the leg; also amputation of left leg for shot wound of ankle; death. MATTHEW (T. P.) (*Medical and Surgical History of the British Army, etc., in the years* 1854-'55-'56, London, 1858, p. 36) tabulates from the Crimean War a case of excision of the os calcis and part of the astragalus; the patient was invalided. OCHWADT (A.) (*Kriegschirurgische Erfahrungen*, Berlin, 1865, Appended Table, p. XVI, Case No. 65): Private C. L——, 64th Prussian Regiment, was shot in the calcaneum, April 18, 1864; excision of calcaneum was performed by LANGENBECK on May 24; recovery. LÜCKE (A.) (*Kriegschirurgische Aphorismen aus dem zweiten schleswig-holsteinschen Kriege, im Jahre* 1864, in *Archiv für Klinische Chirurgie*, Berlin, 1866, B. VII, p. 129): A. Riep, 24th Prussian Regiment, shot June 29, 1864, through the calcaneum; removal of fragments at various periods; August 2, subperiosteal excision of calcaneum by LÜCKE; August 15, gypsum bandage; recovery; in December, 1864, there was a moderate amount of new osseous formation. OTIS (G. A.) (*Circular* No. 3, War Department, Surgeon General's Office, Washington, 1871, p. 227): C. L——, 1st U. S. Cavalry, shot wound of calcaneum, at Camp Bidwell, Nov. 3, 1866; caries; excision of portion of calcaneum February 26, 1867; good recovery. J. E——, 10th U. S. Cavalry, shot through metatarso-phalangeal articulation of left great toe, January 21, 1868, at Fort Riley; March 1, 1868, excision of phalanx and head of metatarsal bone; periosteum preserved; healed with profuse suppuration; recovery. BECK (B.) (*Chirurgie der Schussverletzungen*, Freiburg, i. Br., 1872, p. 900): Soldier, 3d Baden Infantry, shot through the metatarsals; extensive suppuration; excision of the metatarsal bone of the 5th toe in the third week; favorable result. IDEM (*loc. cit.*, pp. 907 and 910) tabulates a fatal case of excision in the metatarsal and another of the calcaneum from the hospitals at Rasstatt and Strassburg. CHIPAULT (A.) (*Fractures par armes à feu*, Paris, 1872, p. 176): J. S——, 41st French Infantry, aged 44; shot wound of left foot; Beaugency, Dec. 8, 1870; February, 1871, extensive suppuration; excision of part of astragalus and the entire os calcis two months after injury; wounds cicatrized and patient walked well in June, 1871; in July a fistulous opening discharged fetid pus; death Aug. 18, 1871, of phthisis. HEYFELDER (O.) (*Bericht über meine Wirksamkeit am Rhein, etc.*, in *Petersburg Med. Zeitschrift*, 1871, B. II, p. 61): Bazze, 67th Infantry; shot wound of os calcis and calcaneum Aug. 16, 1870; December 9, excision of part of calcaneum; reproduction of bone followed in a few weeks. IDEM (p. 80): French officer, shot through the os calcis at Sedan(?); partial excision of calcaneum by HEYFELDER; good recovery. TILING (G.) (*Bericht über* 124 *im serbisch-türkischen Kriege im Baracken-Lazarcth des Dorpater Sanitats-Trains zu Swilainats behandelte Schussverletzungen*, Dorpat, 1877, p. 81): M. G——, aged 21; shot fracture of calcaneum in September, 1876; excision of the os calcis; wound nearly healed in October.

[3] HAMILTON (F. H.) (*A Treatise on Military Surgery and Hygiene*, New York, 1865, p. 508): "The tarsal bones constitute a large portion of that important arch upon which the entire bony superstructure rests. The several portions of which it is composed are all alike essential to its perfection, and the removal of any single bone necessarily gives a certain degree of instability to the gait. What, therefore, might be regarded as a success in any other portion of the body must often be regarded as a failure here."

differing materially from each other. The medio-tarsal operation of Chopart,[1] between the astragalus and scaphoid bone (FIG. 361), was performed in eighty-five instances. In two the results were not determined; seventy-two were successful and eleven fatal. In two instances, with one recovery and one death, the reports merely indicate that the ablation was performed through the tarsal bones; these operations were probably also after Chopart. Lisfranc's[2] amputation through the tarso-metatarsal articulation (FIG. 362) was performed on twenty-four patients; twenty-two recovered, one died, and one result was not determined.

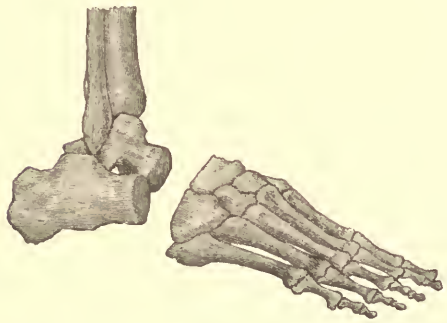

FIG. 361.—CHOPART'S amputation of the foot. [After ESMARCH.]

Hey's operation,[3] in which the four outer metatarsal bones are exarticulated at their junction with the tarsals, and the projecting part of the first cuneiform bone which supports the great toe is removed, was performed in seventeen cases; eleven were successful and six fatal. In one hundred and thirteen instances from one to four toes, with the corresponding metatarsals, were amputated,[4] and in one thousand two hundred and twenty-seven cases one or more toes were removed.[5] Of the two hundred and ninety-one patients with amputations in the foot, thirteen submitted to subsequent operations, viz: one to amputation at the ankle joint and twelve to amputations in the leg; one of the latter died. The twelve hundred and twenty-seven amputations of toes were followed by amputations in the foot in two, at the ankle joint in two, in the leg in six, at the knee joint in one instance, making a total of eleven re-amputations following amputations of the toes. In five hundred and fifty cases the amputation involved the right limb, in eight hundred and forty-seven the left limb, and in one hundred and twenty-one the side was not indicated.

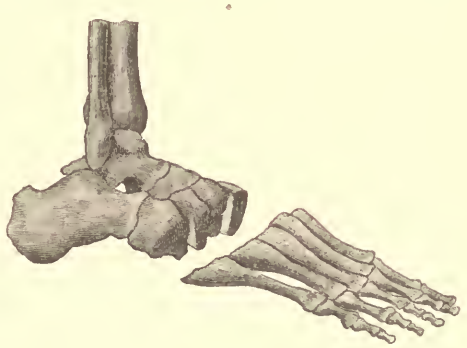

FIG. 362.—LISFRANC'S amputation in the foot. [After ESMARCH.]

It is difficult to attain a common standard of the usefulness of the foot after amputation, as the patient, according to his individuality, personal vanity, or the necessities of his condition, will insist on diverse requirements; but it is evident that a well-rounded stump is of the utmost importance. A remaining portion of a finger or thumb may be very useful; but a remaining toe will frequently be a source of annoyance and even an inconvenience; will add nothing to the patient's power of locomotion and prove a hindrance to the proper fitting of a shoe.

[3] HEY (W.), *Practical Observations in Surgery illustrated by cases*, London, 3d ed., 1814, p. 554.

[4] Four metatarsals with their corresponding toes were amputated in 3 instances; three in 7 instances, two in 19 instances, and one metatarsal and the corresponding toe in 84 instances. Of the 113 cases, 5 were not terminated, 99 recovered, 9 were fatal.

[5] The operation involved one toe in 1,001 cases, two in 145, three in 31, four in 8, and all toes in 18 instances; in 24 cases the number of toes removed was not indicated.

CHAPTER XI.

MISCELLANEOUS INJURIES.

In the beginning of this work, in the first chapter on injuries of the head, and to some extent in the second, third, and fourth chapters on injuries of the face, neck, and spine, the miscellaneous injuries, as well as the injuries by weapons of war, were discussed. But as the work progressed it was found advantageous for the compiler as well as the reader to examine the injuries caused by direct impact of weapons of war by themselves, and to reserve the injuries from other causes for a separate chapter. In this chapter will, therefore, be considered the numerous accidents similar to those daily occurring in civil life, and to which the soldier is likewise exposed, such as burns, scalds, contusions, sprains, dislocations, frostbites, simple and compound fractures, punctured and incised wounds—not including sabre and bayonet wounds—and lacerated wounds. As will be seen from the following tabular statement the number of these injuries was by no means insignificant:

TABLE CIII.

Summary of One Hundred and Seventy-one Thousand Five Hundred and Sixty-five Miscellaneous Injuries.

	CLASSIFICATION.	TOTAL.		Percentage of Mortality.	WHITE TROOPS.		COLORED TROOPS.	
		Cases.	Deaths.		Cases.	Deaths.	Cases.	Deaths.
1	Burns and Scalds	10,100	98	0.97	9,487	94	613	4
2	Contusions	46,972	172	0.36	44,323	161	2,649	11
3	Concussion of Brain	922	215	23.31	873	193	49	22
4	Compression of Brain	61	17	27.86	61	17	.....	.....
5	Sprains	42,704	3	.00	38,387	3	4,317	.....
6	Dislocations	3,016	10	0.33	2,908	9	108	1
7	Fractures	1,287	53	4.11	1,287	53	.....	.....
8	Simple Fractures	4,346	76	1.74	4,215	61	131	15
9	Compound Fractures	1,371	397	28.95	1,316	378	55	19
10	Incised Wounds[1]	22,227	163	0.73	20,932	161	1,295	2
11	Lacerated Wounds	14,748	467	3.16	14,153	459	595	8
12	Punctured Wounds[2]	5,384	169	3.13	4,902	162	482	7
13	Poisoning	3,154	110	3.48	3,087	93	67	17
14	Other Accidents and Injuries	15,273	1,075	7.03	13,099	1,003	2,174	72
	Aggregates	171,565	3,025	1.76	159,030	2,847	12,535	178

[1] The entire number of incised wounds as indicated on page XXV of the First Surgical Volume was 22,749. From these have been deducted 522 sabre wounds referred to in the preceding ten chapters.

[2] The entire number of punctured wounds as indicated on page XXV of the First Surgical Volume was 5,784. From these have been deducted 400 bayonet wounds referred to in the preceding ten chapters.

Besides the number of accidents recorded in the preceding table there were a number of deaths from violence, such as drowning, suicide, homicide, and execution of sentence:

TABLE CIV.

Summary of One Thousand Three Hundred and Thirty-six Deaths from Various Causes.

	CAUSES.	TOTAL DEATHS.	WHITE TROOPS.		COLORED TROOPS.	
			Deaths.	Percentage.	Deaths.	Percentage.
1	Drowning	797	672	84.32	125	15.68
2	Suicide	278	270	97.12	8	2.88
3	Homicide	126	114	90.48	12	9.52
4	Execution of Sentence	135	103	76.30	32	23.70
	Total	1,336	1,159	.....	177	.....

The total number of troops engaged during the war is estimated (see introduction to *First Medical Volume*, p. XXXIX) at 2,335,942 men; of these 2,157,047, or 92.34 per cent., were white and 178,895, or 7.66 per cent., colored. It will thus be seen that the percentage of suicides among the colored troops was very small, while the percentages of deaths from accidental drowning and execution of sentence were large.

The injuries recorded in the preceding tables are of such frequent occurrence in daily life, and their treatment is so fully discussed in surgical journals and text-books and in the reports of civil hospitals, that it will only be necessary here to introduce, without comment, a few of the more serious examples of the different accidents, and to give, in tabular form, a summary of the operations subsequent to these injuries.

Burns and Scalds.—Injuries caused by the exposure of living tissue to a high degree of temperature are called burns; when the burn is produced by hot or boiling liquid it is called a scald. The pathological conditions and the treatment of burns and scalds are fully described by Dupuytren, Long, Erichsen, Crompton, Ashhurst, Follin, and Legouest and others.[1] The large majority of the ten thousand one hundred injuries of this nature during the war were of an exceedingly trivial nature, only ninety-eight, or 0.9 per cent., proving fatal. Those caused by the action of powder,[2] from explosions of cartridges, caissons, or magazines, were the most serious, and a few instances will be cited.

CASE 937.—Private G. Witter, 1st Ohio Battery, aged 29 years, was injured by the explosion of a caisson during the action near Winchester, July 20, 1864, and entered the Cumberland General Hospital three days afterwards. Acting Assistant Surgeon M. M. Townsend recorded the following description of the case: "The patient was suffering from burns of his face, arms, and hands. When admitted his appearance was dreadful, the burns involving the whole of the face, the anterior surface of the neck, and parts of the external surfaces of the forearms. On the hands the skin was destroyed in several places at the dorsal surface and ulnar edge. The patient's face was covered with a complete mask of dried pus, oil, and cotton, causing him to look like a negro in the suppurating stage of confluent small-pox. Warm emollient poultices and assiduous washing soon

removed the offensive incrustations, when a saturated solution of alum was applied with good effect. To the deepest burns on the hands poultices of slippery elm were found to be more grateful and beneficial than the alum and were therefore substituted, being followed three days later by simple cerate. This was continued until cure was complete." On September 5th the patient was transferred to Camden Street Hospital at Baltimore, where he remained until May 16, 1865, when he was mustered out of service and pensioned. Examining Surgeon J. G. Orton certified to the existence of "several extensive scars, the result of burns. One over the posterior part of the left elbow impairs the action of the extensor muscles and renders the joint defective. He also complains of pain in the back and over the bowels, resulting from a fall at the time of the explosion." Subsequent examiners report no additional information. The pensioner was paid September 4, 1881.

CASE 938.—Private C. H. Shields, 6th Maine Battery, aged 21 years, was injured by the explosion of some cartridges during the battle of the Wilderness, May 6, 1864. Surgeon H. C. Tompkins, 4th New York Artillery, reported his admission to the Artillery Brigade Hospital, Second Corps, with "severe burn of face and hands by powder." From the field the injured man passed to Armory Square Hospital at Washington, and thence to Cony Hospital at Augusta, where he was discharged from service for disability June 13, 1865, and pensioned. Examining Surgeon J. B. Bell reported, July 8, 1865, that "the disability results chiefly from disfigurement. Both ears were disagreeably deformed and partially destroyed. The left side of the face is scarred and blackened, and the use of the left hand is somewhat impaired by the scar of the burn." Examiner G. W. Burket, of Tyrone, Penn., certified September 4, 1873: "Both ears were burnt, causing partial deafness from closure of the external meatus of the left ear." Examiner I. E. Oatman, of Sacramento, Cal., September 4, 1879, confirmed the existence of partial deafness, also that the upper and greater portion of both ears were burned off by the explosion.

CASE 939.—Private C. Withee, 1st Wisconsin Battery, was severely injured by the explosion of a caisson during the battle of Big Black River, May 18, 1863. He was admitted to Union Hospital, Memphis, three weeks afterwards, where Surgeon J. D. Brumley, U. S. V., recorded the following result: "He had been very badly burned over his face, both hands and both arms, by the accident, and when he entered this hospital he was a most pitiful and repulsive looking object. His face was covered with scabs so that the eyes could not be opened. A bullous eruption covered the body and arms, and tetanus caused the left hand and wrist to be so contracted that the finger nails were embedded into the wrist, while the wrist was flexed on the arm to such an extent as to bring its dorsal aspect further down than any part of the hand. Trismus existed, so that a spoon could hardly be introduced between the teeth. By tonics, anodynes, and supporting treatment the patient was relieved sufficiently to enable him to converse and to take food by means of a spoon. His mind, which had been delirious, now became sane, and his left arm was straightened by gradual force, after which splints were applied. On June 15th, however, when taking some drink—after having taken his nourishment in the morning as usual—he appeared to have difficulty in swallowing, and in half an hour afterwards he died, apparently from suffocation caused by spasm of the epiglottis."

CASE 940.—Private R. A. Runion, Co. I, 68th Indiana, aged 24 years, had his feet scalded by accident, and was admitted to Hospital No. 13 at Nashville on February 26, 1863. Surgeon E. Swift, U. S. A., contributed the following report of the case: "The injury was caused by the upsetting of a pot of hot coffee, involving the right foot at the heel and toes and affecting the left foot but slightly. No unfavorable symptoms were presented when the patient was admitted. His pulse and respiration were natural; tongue lightly furred; bowels rather loose, with a tendency to diarrhœa. The wound was dressed with simple cerate. On February 28th his bowels became more loose, accompanied by slight pain, when pills of blue mass, ipecacuanha, and opium were prescribed. The effect of this seemed to be favorable and indications were generally promising until March 5th, when the bowels became costive, the urine scanty and very highly colored, and the skin yellow, showing all the symptoms of an aggravated case of jaundice. With a view of gently moving the bowels, two compound cathartic pills were then given, followed four hours afterwards by doses consisting of two grains of quinine, three grains of nitrate of potassa, and one-twelfth of a grain of morphia. On March 7th the bowels were still costive and the urine scanty. Indeed all the symptoms were aggravated and the patient had a severe spasm followed by delirium approaching mania. Three pills, each containing five grains of blue mass and one drop of croton oil, were now prescribed, one to be given every three hours until the patient had an operation. He was bathed, and warm water was given freely, and corn-meal gruel. On March 8, 1863, the patient died, having been comatose and perfectly unconscious since the spasm of the previous day. Perspiration and urine became profuse before death. *Sectio cadaveris:* An incision was made from the ensiform cartilage to the symphysis pubis and transversely to the crest of the ilium. The general appearance of the liver was not marked, though of a rather pale color and tough in texture. The gall bladder contained the usual amount of bile, the hepatic and cystic ducts being perfectly pervious and free. The ileum and jejunum were natural in appearance, but the duodenum gave evidence of being the seat of the disease. It had a soft, doughy feeling, its inner coats being softened down and entirely disorganized; perforation had taken place at a number of places in this part of the intestinal canal. The outer coat was perforated, with sharp well-defined edges, while the inner coats were softened and beveled, and indeed affected in their entire surface. A marked peculiarity was that the disease involved only the duodenum, the other parts of the alimentary canal being in a perfectly normal condition."

Contusions and Sprains.—Less serious even than the preceding group of injuries were the numerous contusions and sprains. Forty-six thousand nine hundred and seventy-two of the former had one hundred and seventy-two, and forty-two thousand seven hundred and four of the latter had three deaths,—a total of eighty-nine thousand six hundred and seventy-six cases, with one hundred and seventy-five deaths, or a mortality of 0.19 per cent. As a rule the patients were returned to duty, no lasting disabilities having followed the injuries. A few of the graver cases will here be cited:

CASE 941.—*Contusion of the spine.*—Private J. Sanford, Co. I, 32d Massachusetts, aged 37 years, was accidentally hurt in the back on September 12, 1862. He was admitted to Fairfax Seminary Hospital the following day, where he was discharged

from service on December 8, 1862. Surgeon D. P. Smith, U. S. V., certified to the following disability: "An injury of the lumbar vertebræ which has resulted in inflammation of the kidneys and of the tissues of the lumbar region, rendering it difficult for him to stand." The Boston Examining Board reported, November 27, 1862: "Partial paralysis of the superior and inferior extremities, bowels, and bladder from injury to spine. The paralysis of the inferior extremities is no worse than a year ago, perhaps the legs are a trifle smaller. The paralysis of the arms has increased somewhat. The disability is permanent and incapacitates him for all manual labor." Dr. W. H. Wallace, of East Boston, testified, March 29, 1880: "The pensioner is suffering from an injury of the spine, partial paralysis of the upper and lower extremities, great irregularity of the bowels—sometimes obstinate constipation, at others diarrhœa; also inability to retain the urine and at times inability to pass it. He requires the passing of a catheter once and often twice a week, and is unable to feed, dress, or undress himself fully two-thirds of the time. There is emaciation and loss of sleep from pain in back and legs. He will never be any better."

CASE 942.—*Contusion of the spine.*—Private R. Clark, Co. D, 6th Ohio Cavalry, aged 54 years, received an injury of the spine during the battle of Bull Run, August 29, 1862, and was treated at St. Aloysius Hospital, Washington. Assistant Surgeon A. Ingram, U. S. A., in charge, reported the man's discharge from service December 18, 1862, by reason of "slight anterior curvature, with much tenderness resulting from the injury." The Chicago Examining Board, September 5, 1873, reported that the man was hurt by falling from his horse, and that "the horse stepped upon his loins, injuring the structure of the spine in the muscular and fibrous portions. There is apparent permanent rigidity of the spinal muscles and great pain on pressure or movement." Examining Surgeon J. F. Daggett, of Lockport, Illinois, May 22, 1877, certified to an injury of the spine, etc., and stated that it is difficult to determine what structural impairment there is, but that the functional derangement is severe and continued, and that there is "anchylosis of the lumbar vertebræ; brain affected from spinal irritation or other causes; tendency to mental derangement; general health bad." The pensioner died August 24, 1881, from the results of his injuries.

CASE 943.—*Sprain of the back.*—Private J. B. Saunders, Co. K, 143d New York, aged 47 years, entered Satterlee Hospital, Philadelphia, December 23, 1862. He had several months previously received a fall against the arm of a seat in a railroad car, straining the small of his back. Since then he had suffered from occasional retention of urine, and his bowels were never moved except by the most powerful cathartics. Pressure upon any of the lumbar vertebræ appeared to give pain, but there was no fracture or displacement to be detected. While the patient remained in Satterlee Hospital large doses of castor oil, with one drop of croton oil added, were administered, and pills of compound extract of colocynth, with one-sixteenth grain of strychnine added, were given. Friction to the spine, with stimulating liniments, was applied. No change took place in the condition of the patient, who was discharged from service January 29, 1863, and subsequently became a pensioner. Surgeon I. I. Hayes, U. S. V., who reported the case, described that there seemed to be a complete paralysis of the muscular coats of the large intestine and also of the sphincter ani, from which cause an evacuation would take place only when the mass of fæces became so great from natural accumulation or from the action of the cathartics as to no longer leave room in the bowels to contain it, when the fecal matter appeared to pass off by force of gravity and unmolested by the sphincter as soon as it reached the rectum. Examining Surgeon A. Otis, of Ellinsville, N. Y., December 8, 1872, certified: "There is great tenderness of the spine, especially of the lumbar vertebræ. His lower limbs are very weak and at times almost paralyzed. He trembles almost continually, has an anxious, waxy, and cadaverous expression of countenance, difficulty in micturition, and is excessively constipated." The pensioner died from the effects of his injuries December 2, 1875.

CASE 944.—*Contusion of the abdomen.*—Private A. Bickel, Co. K, 142d Pennsylvania, aged 29 years, entered Satterlee Hospital July 10, 1863, having received a severe injury during the march to Gettysburg. The accident was incurred while a fence was being knocked down for the purpose of facilitating the passage of troops, when he was struck with the butt end of a musket in the lower part of the abdomen, causing a severe contusion of the bowels and forcing the right testicle back into the abdomen. The patient suffered much from pain in the bowels, which were also quite inactive, and his general health as well as his appetite was poor. His treatment consisted of the administration of compound cinchona tincture and of rhubarb, to which subsequently aloes and small quantities of extract of nux vomica and hyosciamus were added. On November 1st, the patient's bowels being still very painful and inactive, the medicines were discontinued and injections of warm salt water were substituted. Very little change in the condition of the patient occurred up to December 16, 1863, when he was discharged from service and pensioned. The history of the case was contributed by Acting Assistant Surgeon D. Kennedy. Examining Surgeon S. L. Beck, of Mifflinburg, Pennsylvania, September 17, 1873, certified that "the stroke produced an injury of the bladder and an abdominal rupture, which causes some pain and other inconvenience, so that he is somewhat disabled in performing manual labor. He will be no better, but may get worse." Examiner T. H. Wilson, of Lewisburg, Pennsylvania, reported, November 14, 1881: "I find the pensioner has a reducible inguinal hernia in the right side and has been wearing a truss, which, he alleges, does not retain the bowel completely, so that it frequently escapes in spite of the truss," etc.

CASE 945.—*Contusion of the shoulder.*—Private J. M. Granger, Co. F, 141st New York, aged 26 years, entered Central Park Hospital, New York City, December 17, 1862. Surgeon B. A. Clements, U. S. A., forwarded the following report: "In October, 1862, the patient was injured at Annapolis by the falling of a heavy piece of timber on his right shoulder, striking upon the superior and posterior aspect over the spine of the scapula. The blow was so severe as to knock him down. He was immediately taken to hospital, where the hand and arm swelled largely and he became unable to use them without great suffering. Five weeks afterwards he entered Trinity Hospital at Washington, whence he was transferred here two weeks later. On examination the patient was found to be well nourished and in general good condition, but his face had an anxious expression, or that of suffering. The right shoulder was swollen, the greatest amount of tumefaction being directly over the supra-spinous region. The whole arm and hand were also swollen and of a purplish color, and the patient was unable to raise them except to a limited degree. By an assistant the arm could be moved with difficulty and the hand might be placed on the top of the head. The patient underwent a variety of treatment, including colchicum, iodide of potassa, liniments, etc., without any appreciable benefit, the condition of the shoulder and arm remaining unchanged, the hand swollen and cold, and the arm quite stiff and useless. When he received his discharge from service December 23, 1863, his general health was not as good as formerly." He subse-

quently made application for pension, and received the following certificate from Examining Surgeon W. M. Chamberlain, of New York City: "There has been a general contusion of the shoulder, followed by inflammatory action about the joint. Depression of the shoulder and almost total inability to use the arm is dependent perhaps upon rupture of the musculo-spiral nerve." Owing to the applicant's inability to prove the origin of the injury in the line of duty his claim for pension was rejected.

CASE 946.—*Sprain of both ankles.*—Private A. Leehaus, Co. K, 4th Ohio Cavalry, aged 39 years, accidentally sprained both ankles severely at Stone Mountain, October 23, 1864. After passing through various hospitals he was transferred to Madison, where he was mustered out of service May 25, 1865. Subsequently his name was admitted on the Pension Rolls. Examining Surgeon J. S. McNeeley, of Hamilton, Ohio, certified July 2, 1873: "Both ankles are partially anchylosed, the right one to a greater extent, and both are painful when walking, especially at night after having walked much during the day. The pains are influenced by atmospheric changes. The right ankle is always swollen, the left one at times." Other examiners substantially report the same condition. The pensioner was paid December 4, 1880.

Concussion and Compression of the Brain.—The nine hundred and eighty-three cases of this group have been considered in detail in the chapter on injuries of the head, and the reader is therefore referred to pp. 35–68 of the *First Surgical Volume.*

Dislocations.—The percentage of mortality of the three thousand and sixteen cases of dislocations was 0.33, death having followed the injury in ten cases; but the records of the Pension Office show that the results of many of these injuries were severe and of long continuance, the disabilities frequently increasing with time.

The great number of bones, with their projecting processes, which form the vertebral column, the narrow limits to which mobility in the column is confined, the manner in which the articular surfaces are joined, the number and strength of ligaments which hold them together, and of the muscles which enclose them, would seem to preclude the possibility of displacing any portion of the column without at the same time causing a fracture of the body of the vertebra or of its many processes. A few cases of dislocation of the dorsal or lumbar vertebræ without fracture were recorded, but the correctness of the diagnosis in some of the cases may well be questioned. A case of luxation of the lumbar vertebra is reported by Surgeon E. Bentley, U. S. V.:[1]

CASE 947.—*Dislocation of first lumbar vertebra.*—Private A. Hoffman, Co. E, 101st New York, sustained a dislocation of the superior lumbar vertebra by the falling of the brick wall of a building at Port Republic, June 1, 1862. He was admitted to Washington Street Hospital, at Alexandria, sixteen days after the occurrence of the accident, there being perfect paralysis of all

[1] Instances of dislocation of the lumbar vertebræ are not frequent. HAMILTON (F. H.) (*A Practical Treatise on Fractures and Dislocations*, Philadelphia, 1875, p. 541) cites two cases: one from CLOQUET (*Obs. d'une luxation de la colonne vertébrale comp. de fracture, et suivie de guérison*, in *Orthop. Clin. sur les Difformités*, par C. A. MAISONABE, Paris, 1834, T. I, p. 453, a second from DUPUYTREN (*Leçons Orales de Clin. Chir.*, Paris, 1839, T. I, p. 464); both cases were accompanied by fracture. To these may be added instances cited by: FABRICIUS HILDANUS (*Opera quae extant omnia*, Francofurti ad Moenum, 1646, Cent. V, Obs. 68, p. 459): A farmer, falling from a tree, had one of the lumbar vertebræ forced inward; paralysis of the lower extremities; he survived several years. AURRAN (*Luxation incomplete des vertebres*, in *Jour. de Méd. Chir. Phar.*, etc., Paris, Decembre, 1771, T. XXXVI, p. 522): A man was forcibly thrown on his seat; the spinal apophyses of the 2d and 3d lumbar vertebræ became very prominent; diastasis of the vertebræ; body bent forward; unable to straighten out; amelioration in two months. SCHMUCKER (J. L.) (*Von einer Verrenkung des letzten Rücken- und ersten Lendenwirbelbeins, vom Herren* RÜDIGER, in *Vermischte Chirurgische Schriften*, Berlin und Stettin, 1776, B. I, p. 286): A wall falling on a soldier caused dislocation of last dorsal and first lumbar vertebræ, the former being forced outward and to the right to the width of three fingers; recovery. BRÜCKMANN (*Beobachtung einer Verrenkung des zweiten Lendenwirbels*, in *Arch. für Med. Erfahrung. im Gebiete der prakt. Med. Chir. Geburtsh. und Staatsarzneikunde, Jahrgang* 1825, Berlin, 1825, p. 469): Young man, aged 30, jumped from third-story window; dislocation of second lumbar; paralysis of bladder; survived the injury eighteen months. LARREY (D. J.) (*Clinique Chirurgicale*, Paris, 1829, T. III, pp. 271–272): A young soldier received a complete luxation of the first lumbar from a contusion by a cannon ball; recovery. A young Swiss soldier fell from a third story window; complete luxation of first lumbar; leg fractured and amputated; recovery. A soldier named Samson received a complete luxation inward of the first lumbar by a fall from a parapet; spine curved till the head touched the knee; lower extremities paralyzed; paralysis gradually diminished; patient survived. LEBERT (*Luxation simple et incomplète par cause externe de la douzième vertèbre dorsale, en avant de la première lombaire, etc.*, in *Bull. de la Soc. Anat. de Paris*, Paris, 1836–'37, T. II, p. 238): Déloge, aged 50, received a dislocation of the first lumbar by the fall of a scaffolding; paralysis of lower extremities; death in 46 days; at the autopsy the first lumbar was found dislocated downward and inward; there was fracture of the body of the vertebra. MERTENS (*General-Bericht des Königl. Rheinischen Med. Collegii über das Jahr* 1840, Koblenz, 1841, p. 97) successfully reduced a dislocation of the third lumbar which projected half an inch. KEIJ (*Förhandlingar vid Svenska Läkare-Sällskapets sammankomster*, 1857–1858, in *Hygiea*, Stockholm, 1858, B. XX, p. 116): Sailor, aged 23, January 7, 1858, second lumbar dislocated 7 lines backward, fracture of articular and transverse processes; death. KUNKLER (G. A.) (*Case of Dislocation of Third Lumbar Vertebra*, in *Cincinnati Lancet and Obs.*, 1858, Vol. I, p. 212): In 1856, a young man, aged 19, was thrown from a swing; large depression, fully admitting a pigeon's egg, in region of third lumbar vertebra; recovery; depression remaining. VINCENT (*Bulletins de la Société Anatomique de Paris*, Paris, 1850, T. XXV, p. 85), in March, 1850, presented to the Anatomical Society of Paris a specimen of fracture and dislocation of the first lumbar vertebra. Patient had been injured 8 months previously; the fracture had consolidated; there had been paralysis of the lower extremities and of the bladder and rectum. HOLMES (T.) (*Dislocation of the Spine in the Dorsi-Lumbar Region*, in *Transact. of the Path. Soc. of London*, 1859, Vol. X, p. 219): Man, aged 19, struck across the loins by a heavy piece of timber on October 30, 1858; paralysis of lower extremities and bladder; died Nov. 22; preparation in St. George's Museum; the transverse processes of the lumbar vertebra are fractured. RANKE (H. R.) (*Ueber Beugungsluxation der Lendenwirbel*, inaug. diss., Halle, 1873, p. 14): Man, aged 30, fell about 30 feet from a platform; luxation backward of first lumbar; paralysis of lower extremities and bladder; compression of spinal cord; death after 2 months and 11 days. The autopsy showed that there was no fracture. PORTA (L.) (*Delle lussazioni delle vertebre, etc.*, Oss 7, p. 6): A soldier fell from his horse and dislocated the fourth lumbar forward the width of a

the parts below the seat of injury. His stools passed off involuntarily, and the urine was drawn off by the catheter. On July 5th he passed his urine freely and some slight sensation was felt in both feet and legs. Erysipelatous inflammation attacked the inguinal region of the right side and resulted in gangrene, terminating in death on August 29, 1862. No autopsy was recorded.

In the next case the ninth dorsal vertebra was displaced, allowing two fingers to be inserted between the eighth and the tenth vertebra.

CASE 948.—Surgeon G. Jewett, 51st Massachusetts, describes a case of dislocation, which occurred at Newberne, May 20, 1863, as follows: "The case was an injury of the spine, not positively diagnosticated. The patient was in a sitting posture when he was crushed to the ground by a great weight from behind applied to his back and shoulders, bending the back nearly double. Within three minutes I examined the back and found a fluctuating tumor occupying the site of the ninth dorsal vertebra. The tenth was very prominent. Two fingers could be inserted between the eighth and tenth. Perfect loss of sensation and motion existed below the injury, with paralysis of the sphincters, and there was considerable shock and violent pain in the epigastrium. The treatment was by rest and opium. Three days after the accident a digital examination showed a reappearance of the lost vertebra, a great difference between the spinous processes still remaining. No crepitus could be discerned at any time. At this date (the eleventh day after the injury) the patient is in General Hospital and the paralysis still continues. My opinion is that there was a luxation anteriorly of the ninth dorsal vertebra." No positive identification of this case has been practicable from the registers of the New Berne hospitals. Corporal J. F. Simpson, Co. I, 51st Massachusetts, is the only member of that regiment who is recorded as having been treated for "paralysis" at the Stanley Hospital from May 25th to July 6, 1863. Three weeks later he was mustered out by expiration of service. He is not a pensioner.

Displacement of the eighth dorsal vertebra was accompanied by fracture of the processes in the following case:

CASE 949.—Private R. L. Root, Co. D, 32d Wisconsin, aged 33 years, was severely hurt in the back while engaged in building fortifications at Decatur, June 20, 1864. About five weeks afterwards he was transferred to Nashville, whence Surgeon R. R. Taylor, U. S. V., reported his admission to hospital No. 8, and described the injury as a "dislocation of the spine." Several months later the patient was transferred to Brown Hospital, at Louisville, where he was discharged for disability November 10, 1864, Assistant Surgeon B. E. Fryer, U. S. A., certifying to "fracture of dorsal vertebra, producing paralysis of the right inferior extremity." Examining Surgeon W. H. Walker, of Fond du Lac, Wisconsin, reported, June 10, 1865: "He was injured by being crushed down under a stick of timber. Fracture of the process of the eighth dorsal vertebra seems to have been produced, which has resulted in extensive forward curvature of the spine. The ligaments of the right hip joint were strained so that they are now relaxed, weakening the joint." Examiner H. Roberts, of Providence, Pennsylvania, December 28, 1868, made a corroborating report of the injury and its results, stating that "a gradual and increasing curvature of the spinal bones in the portion known as the dorsal has been going on for three years. The curve is about eight inches in length and the deviation is now two inches to the right, with a very short convex curve also. For the past year he has had to almost entirely abandon any work which required him to stoop forward and lift any light weight." The Philadelphia Examining Board, June 8, 1881, referred to curvature and deformity as being very marked, and added that the pensioner "states that he suffers from numbness in the lower extremities. There is atrophy of the muscles over the buttock. He would have been benefited by a spinal support, but owing to the want of this he has become so disabled that he can do no labor."

As an example of sub-luxation of one of the cervical vertebræ Surgeon J. Tunnicliff, 1st Michigan, has furnished the following notes of an accident which occurred on the Baltimore and Ohio Railroad during the month of November, 1861:

CASE 950.—"The man was standing guard during a gale on an embankment while a lumber train was passing. The wind blew him off the bank down into the cut, by the passing train, and at the same time lifted a quantity of lumber from the cars and piled it on him. It was about two minutes before the lumber could be removed sufficiently to relieve him. The main injury seemed to be in the cervical vertebræ. Indeed, the force of the blow as well as the weight of the lumber was on the neck. As he was lifted up he said 'he thought his neck was broken.' His head was inclined to one of the shoulders, and for a number of minutes he was utterly unable to raise it up. The pain he represents as having been most excruciating. He persisted, however, in his efforts, with the assistance of one of his comrades, who performed traction by grasping his head, when a sudden snap was felt and heard distinctly by himself and those about him, and his head had resumed its normal position. This was followed by acute pain at the point of the injury to the cervical column, with a most distressing tingling sensation and pain down the brachial plexus, which continued more or less for four weeks after the injury. He was unable to rotate his head one-half inch even after five weeks, and, although improving, he cannot now (December 31, 1861) do it more than two inches, marking at this time about four inches of a segment of a circle with the end of his nose." The name of the soldier could not be learned.

---

finger; no fracture; ligament destroyed. FOWLER (R. S.) (*Dislocation of the Lumbar spine*, in *The British Med. Jour.*, 1863, Vol. II, p. 280): Laborer, aged 25, in 1863; dislocation between 1st and 2d lumbar, the lower vertebra being thrown behind and to the left of that above it; lower extremities not paralyzed; death on the following day; at the autopsy no fracture of the vertebræ was discovered. *Clinical Lectures and Reports of the London Hospital*, London, 1866, Vol. III, pp. 348, 354: At the Museum of the London Hospital are 3 specimens of luxated lumbar vertebræ; in one the body of the first lumbar has slipped forward for about half an inch on the surface of the second, crushing the latter. In the second specimen the third lumbar is nearly half an inch in front of the fourth, with only very slight splintering of the edges of the bones. The third specimen shows a clean dislocation of the third lumbar forward without fracture. The articular processes of the third lumbar have completely left those of the fourth and passed forward a third of an inch. There is no important fracture. EULENBERG (A.) (*Luxation und Fractur des ersten Lumbalwirbels, mit tödtlichem Ausgange durch Rückenmarkscompression und secundäre Cystitis und Pyelonephritis*, in *Archiv für Klin. Chir.*, Berlin, 1866, B. VII, p. 507): A printer, on May 1, 1865, fell a distance of twenty feet; first lumbar dislocated backward ½ inch; death on the following day; splintering of body of vertebra.

In the following, the sternal end of the clavicle was dislocated upward. As in similar cases cited by Malgaigne and Hamilton,[1] the dislocation could readily be reduced, but it was impossible to retain the bone in its place.

CASE 951.—Private E. D. Hallenbeck, Co. B, 1st Wisconsin Cavalry, aged 26 years, entered Hospital No. 2 at Nashville on August 12, 1863, having sustained a dislocation of the sternal end of the right clavicle by falling from his horse. Acting Assistant Surgeon E. Jennings, who reported the case, stated that the attempt was made to reduce the luxation, but the bone could not be retained in its place. In the following month the patient was detailed for light duty about the hospital, and on February 6, 1864, he was assigned to the Veteran Reserve Corps. He was ultimately mustered out and pensioned. Examining Surgeon W. A. Knox, of Chicago, Illinois, May 18, 1867, reported the "dislocation still unreduced. The injury being upon the right side materially interferes with his capacity for manual labor." The Chicago Examining Board certified, March, 1879: "He has permanent dislocation of the right clavicle from its sternal articulation upward. The end of the bone has affixed above its natural position, weakening the part and limiting the power in the right arm."

Examples of dislocations of the various joints of the upper and lower extremities will next be adduced. Dislocations at the shoulder and elbow joints were the most frequent:

CASE 952.—*Dislocation at the shoulder.*—Farrier L. Swafford, Co. G, 9th Indiana Cavalry, aged 36 years, was severely hurt at Pulaski, November 8, 1864, by his horse falling and throwing him upon his left shoulder, dislocating the joint. For some weeks he was at the regimental hospital, where ineffectual attempts were made to reduce the luxation, and subsequently he entered Gayoso Hospital, at Memphis. Surgeon F. N. Burke, U. S. V., in charge of the latter, reported that the patient was transferred to the Veteran Reserve Corps May 11, 1865, by reason of disability from "chronic dislocation of left shoulder joint." The man was mustered out of service September 4, 1865, and subsequently became a pensioner. Examiner J. Mendenhall, of New Castle, Indiana, reported May 17, 1866: "I suppose the joint has been dislocated; it is now partially anchylosed. He cannot put his hand on top of his head, nor raise the elbow up from the body more than about twelve inches, but can move it better forward than backward. But this motion is limited, though I think it will improve." Examining Surgeon W. H. Boor certified, December 9, 1875: "I find the left shoulder joint anchylosed so that the arm cannot be raised only as the scapula gives it motion. The muscles of the arm and forearm are soft. He says his shoulder is painful." This pensioner was paid December 4, 1880.

CASE 953.—*Dislocation at the elbow.*—Private H. Mewes, Co. E, 63d Illinois, aged 28 years, had his elbow joint dislocated by falling from a wagon during the march near Holly Springs, October 20, 1863. He was treated at the regimental hospital, subsequently in Nashville, and lastly in Clay Hospital, Louisville. Surgeon A. F. Watson, U. S. V., in charge of the latter, described the injury as an unreduced "dislocation of the radius." The man was mustered out of service April 11, 1865, and subsequently made application for pension. Examining Surgeon L. W. Low, of Albion, Illinois, reported June 4, 1868: "The injury is such that the head of the radius is luxated and again adjusted by rotary motion of the hand and forearm, rendering the hand and arm nearly useless for labor and weak at all times." Examiner H. C. Reed certified, July 4, 1879: "The ulna is displaced inward, the olecranon resting on the internal condyle. The forearm is quadriflexed and about one-half pronated, there being very little rotary motion retained. The head of the radius could not be located, but a distinct 'snap' could be felt on forcible rotation outward over the normal site."

CASE 954.—*Dislocation at the elbow.*—Private H. Finley, Co. H, 5th Connecticut, aged 29 years, suffered a dislocation of the right elbow while going to Stevenson, Alabama, October 5, 1864, on a railroad train, which was attacked by the enemy and brought to a sudden stop, causing him to be violently thrown to the ground. He was treated in the field hospitals of the Twentieth Corps until the arrival of the troops at Savannah, when he was placed on board of a hospital steamer and conveyed to McDougall Hospital, Fort Schuyler, New York Harbor. Assistant Surgeon S. H. Orton, U. S. A., certified to the patient's discharge from service March 13, 1865, by reason of uselessness of the right arm from an "unreduced luxation of the ulna backward upon the humerus." Examining Surgeon W. W. Potter, of Washington, D. C., March 29, 1869, certified to the following disability: "A fall upon the right elbow while in a semi-flexed position has driven the olecranon process of the ulna upward between the condyles of the humerus, at the same time forcing them apart. Considerable deformity is the result, with inability to flex the forearm beyond a right angle or to extend it perfectly. He has very little strength in the arm; its motions are circumscribed and general usefulness seriously impaired." Examiner M. Burton, of Richmond, Virginia, reported, September 23, 1873, that "the dislocation still exists, the joint is inflexible and the limb useless for manual labor. The fingers have some power of flexion and extension." This pensioner was paid June 4, 1881.

CASE 955.—*Dislocation at the wrist.*—Private C. Meservey, Co. G, 69th Indiana, aged 47 years, received a severe injury of the left forearm and wrist during the battle of Richmond, August 30, 1862. Surgeon M. K. Taylor, U. S. V., reported his discharge from service at the Keokuk General Hospital, March 5, 1863, by reason of the following disability: "Much deformity from an unreduced fracture of the radius and dislocation of the lower end of the ulna." The man subsequently became an applicant for pension, and received the following certificate from Examining Surgeon S. W. Vance, of Connersville, Indiana, on June 18, 1867: "The injury consisted of a fracture of the lower end of the radius about an inch and a half from its articulation with the semilunar and scaphoid bones, together with a dislocation of the lower end of the ulna. This dislocation and the fracture of the radius just above caused the hand to assume a rather pronated condition, carrying forward with it the lower fragment of the radius, which has united to the superior fragment, leaving the bone, however, very crooked at the site of the fracture and the end of the ulna still dislocated. The condition of the bones necessarily renders rotation impracticable, and

[1] MALGAIGNE (J. F.). *Traité des fractures et des luxations*, Paris, 1855, T. II, p. 426. HAMILTON (FRANK H.), *A Practical Treatise on Fractures and Dislocations*, Philadelphia, 1875, p. 561.

moreover greatly weakens and debilitates the muscles and tendons of the surrounding parts," etc. Examiner A. C. Fosdick, of Brownsville, Indiana, in July, 1875 and 1881, reported no change in the condition of the injured parts.

The following is an example of successful reduction of a dislocation of the head of the femur upward and backward into the great ischiatic notch. The thigh had become flexed on the pelvis at nearly right angles, and the limb was well thrown across its fellow:

CASE 956.—*Dislocation at the hip.*—Lieutenant Colonel W. A. Bullitt, 3d Kentucky, aged 24 years, was wounded at the battle of Rocky Face Ridge, May 9, 1864. He was wounded in two places. The first shot entered at a point five inches below the anterior superior spinous process of the ilium, left side, and did not emerge; the second ball struck the right side between the seventh and eighth ribs and came out about four inches below the point of entrance and two inches posteriorly. An ambulance was obtained and the patient was transported five miles to a field hospital, whence he was taken to Chattanooga the following day. On the ninth day erysipelas commenced in the wound of the right side, which extended all over the body and up to the head, resulting in numerous abscesses in the areolar tissue. On June 3d the patient was transferred to Louisville, where an attack of dysentery came on and reduced him very much. This was in turn succeeded by another attack of erysipelas, extending all over the body as the former had done. About August 7th he began to have a great deal of pain in the left iliac fossa, which at first was paroxysmal and continued a month before the abscess that gave rise to it was detected. This abscess was opened by a deep cut one-half inch to the inside of the anterior superior spinous process and above Poupart's ligament, when a large quantity of pus—estimated by the surgeons present at half a gallon—escaped. The abscess continued to discharge for about three months. When the pain first commenced the patient, in order to feel relief, would flex his thigh on the pelvis during the paroxysms, which came on about 5 o'clock daily; but afterwards he kept the knee closely approximated to the chest and any attempt to extend the limb caused severe pain. About October 20th, while in the act of turning over from his back to his right side, he felt the head of the right femur slip from its position with a severely painful jolt. This occurred almost daily for two weeks, when the attention of the surgeon was called to it and a dislocation was recognized. The patient was etherized and an unsuccessful attempt made to replace the bone. The abscess closed up shortly afterwards. A second attempt at reduction in February, 1865, again failed. A few days later the patient got out of his bed and began to walk about on his crutches. He came to New York City May 24th, where he was admitted to the Central Park Hospital, under the care of Dr. L. A. Sayre, who reports the following: "When I saw him in June his general health was good and he was able to walk about very well on crutches. His left thigh was flexed on the pelvis at nearly right angles and strongly adducted across its fellow, lying on its upper third and compressing the genital organ. The difficulty of urinating was a most serious annoyance. The whole limb was much colder than the other, bathed in perspiration, and much shrunken in size. There was some slight mobility of the hip and of the knee, which was stiffened by a firm contraction of the hamstring muscles. Motion, however, gave pain. On July 20th I determined to attempt reduction by manipulation after the method so well described by Dr. Reed and Surgeons W. J. Sloan, J. J. Milhau, U. S. A. Several bed-quilts were folded and laid upon the floor; the patient was placed thereon and thoroughly anæsthetized by chloroform. After removing my boots I placed one heel on the crest of each ilium, thus holding the pelvis by the weight of my own body, when with some considerable force I succeeded in breaking up the adhesions and obtained tolerable free motion of the limb. The finger was then passed into the rectum as far as the ischiatic notch, and when the limb was moved by an assistant the head of the femur could be distinctly felt gliding on the finger. This examination was also made by Professor Hamilton, and the diagnosis as to the position of the head of the bone was confirmed. I thereupon stated my intention that, should the attempt by manipulation prove unsuccessful, I would wait some days for the inflammation necessarily produced to subside, then subcutaneously divide the contracted adductor muscles and restore the limb to parallelism with the other, leaving the head of the bone in its abnormal position. By considerable effort I finally succeeded in reducing the limb to parallelism with the other, retaining it there by means of extension with weight and pulley over the foot of the bed and secured to the thigh by means of adhesive plaster and a roller. On account of the long-continued contraction of the hamstring muscles the leg could not be extended from the thigh; but as the tension had given way somewhat while the patient was under the influence of chloroform, I concluded to try and bring it straight by constant extension, and consequently applied another plaster below the knee, with weight and pulley on the foot of the bed, a little lower than the former one, the thigh being slightly elevated every day until the limb was straightened and the two extending forces acted in the same line. Another weight and pulley was applied at a right angle to the limb, opposite the knee joint, for the purpose of adducting the limb. An irrigating apparatus, from which cold water was constantly dripping, was arranged over the hip joint, and a rubber cloth placed under to protect the bed. For three days the patient suffered great pain and had to use morphine to allay it; but after the third day no anodyne was necessary. No reactionary fever or constitutional disturbance set in, and at the end of the third week the limb was parallel with the other and of the same length. A line drawn, however, from the center of the pubis to the trochanter major of that side proved to be nearly half an inch longer than measurement on the opposite side, and firm pressure from the foot caused it to ride upon the ilium and become more than an inch shorter than the other. It became necessary, therefore, to devise some plan by which the limb could be extended during walking and the weight of the body borne upon it. I therefore took a plaster cast of the hip in its improved position and on this cast fitted a crutch passing under the pubis and around the gluteo-femoral fold, with a wing hammered out so as to accurately fit the buttock, in which he could comfortably sit. Opposite the tuberosity of the ischium I made a ball and socket joint, from which an iron rod ran down the limb to the ankle joint, being bifurcated at its lower extremity and terminating in rounded knobs, and the main shaft being capable of extension by means of a racket and cog-wheel. A neatly fitting shoe, well padded on the instep to bear pressure, had an iron band secured under the sole, which terminated opposite each side of the ankle in cups or sockets to receive the rounded ends of the rod. With this instrument adjusted and the extension applied the limb was brought to the same length as the other, and the patient could bear his entire weight upon it without pain. The limb, which before the operation had been cold and very much atrophied, now grew rapidly in normal temperature and in October had nearly resumed its natural size." Photographs of the patient, showing the position of the limb before and after the operation, and of the apparatus, applied and unapplied, were forwarded with the history of the case by the operator, who also contributed

two plaster casts, one representing the hip eight months after the luxation and the other the condition of the reduced parts. The casts constitute specimen 4033 of the Surgical Section of the Museum. Lieutenant Colonel Bullitt was mustered out of service October 7, 1865.

CASE 957.—*Dislocation at the hip.*—Private J. B. Holroyd, Co. C, 15th Illinois, aged 28 years, was captured by the enemy during the Atlanta campaign, October 4, 1864, and for months underwent the hardships of the Andersonville Prison, where his left hip joint became affected from the exposure and privation. After being released from captivity he was conveyed to Cumberland Hospital at Nashville, thence to Jeffersonville, and lastly, on July 21, 1865, to Camp Butler. Surgeon A. B. Campbell, U. S. V., in charge of the latter, reported that the patient was suffering from "dislocation of the left hip joint," and that he was mustered out of service August 9, 1865. Examining Surgeon J. G. Hostetter, of Mt. Carroll, Illinois, certified, June 19, 1866: "The ligaments and head of the left thigh bone are diseased, allowing displacement of said bone on making a misstep. He cannot raise his left leg to the height of a stair-step, and drags, as it were, rather than moves his limb in walking." Examiner B. T. Buckley, of Freeport, Illinois, reported, April 7, 1871: "The disability consists in the imperfect use of the left leg, produced by partial dislocation of the hip joint and causing pain and lameness on exercise. The displacement has increased and consequently there is increased inability to use the limb." Examiner H. N. Bradshaw, of Monroe, Wisconsin, stated, January 10, 1875, that "the region of the joint is flatter than it should be, showing considerable atrophy of the muscular structure; the leg below the hip is smaller than the right one, and the muscles are flabby. The leg cannot be flexed upon the abdomen, and any attempt to place it in that position is evidently attended with much pain." This pensioner was paid September 4, 1881.

CASE 958.—*Dislocation at the knee.*—S. Chiquoine, a fireman attached to the U. S. Steamer Rudolph, 21 years of age, and of a strong constitution, sustained a dislocation of the left tibia backward during the action in Mobile Bay, April 1, 1865. He was admitted to the Naval Hospital at Pensacola three days afterwards. The luxation was reduced, but there was considerable swelling of the limb, accompanied by inflammation. The treatment consisted in moulding pasteboard splints to the limb, in keeping the extremities at perfect rest on a double-inclined plane, and in applying water dressings. Ten weeks after his admission the patient was transferred to hospital at New York, where he was discharged for disability June 30, 1865, with probabilities of regaining full use of the limb. The notes of the case were furnished by Passed Assistant Surgeon J. R. Tryon, U. S. N., who supplemented the history with the following remarks: "From the severity of this and other cases I think the dislocation of the tibia in each must have been complete. Considerable deformity about the knee existed for months after the injuries, and the joints in most of them were impaired in some degree by the inflammation, adhesion, etc., which invariably follow." Examining Surgeon L. Jemison, of Bordentown, New Jersey, reported, August 23, 1870: "The bones of the leg now stand a little back from their normal position and the joint seems movable upon the cartilages. He complains when standing any length of time upon his feet, and falls from a slight touch to the limb," etc. The Philadelphia Examining Board in October, 1873, certified to "grating in the knee joint when moved; ligaments relaxed and knee falls back unless supported when his weight is borne upon it," etc. At subsequent dates the same board reported that "the patella projects forward and the internal tuberosity projects inward," also that there is decided crepitus, and that deformity is caused by dislocation of the internal semilunar cartilage of the knee. The pensioner was paid June 4, 1881.

CASE 959.—*Dislocation at the ankle.*—Private J. Reich, Co. K, 21st Illinois, aged 33 years, was severely hurt in the left foot while doing guard duty on the Louisville and Lexington Railroad, June 15, 1864. The accident occurred while he was riding on the cowcatcher of the locomotive, which struck an obstruction on the track and threw him off. He was picked up in a senseless condition and was conveyed to Clay Hospital, at Louisville, where his left ankle joint was found to be much injured. Several weeks afterwards he was transferred to Jefferson Barracks, and lastly he entered the General Hospital at Quincy, where he was discharged December 20, 1864, and pensioned. Surgeon D. G. Brinton, U. S. V., in charge of the latter hospital, reported that the patient was "crippled for life," and described the disability as a "dislocation of the left ankle joint (Pott's fracture) with consequent permanent uselessness of the limb." Examining Surgeon J. H. Maxwell, of Newton, Illinois, September 4, 1873, certified to the disability and stated that "there is great deformity of the foot and ankle in consequence of the dislocation never having been reduced. Walking is very difficult, and if continued becomes painful." Four years later the same examiner reported no improvement in the condition of the limb, stating that "the astragalus is forced below the outer malleolus," that the foot is nearly flat, etc. The pensioner was paid June 4, 1878, since when he has not been heard from.

CASE 960.—*Dislocation of tarsal bones.*—Private J. Beers, Co. F, 84th Illinois, aged 27 years, while on duty as assistant teamster, December 23, 1862, was accidentally precipitated to the ground by the slipping of his left foot. He stated that he heard a cracking sound in the foot and felt something give way about the middle of it. This was attended with intense pain, which subsided in the course of a few weeks. The foot remained swelled about a month, when that also partially subsided, and from that time he has not had pain except when he has attempted to use it in walking. He was present at the battle of Murfreesboro' (December 31st), but was unable to participate in that action on account of lameness. After the battle the surgeon applied a roller bandage, but it produced so much pain that he soon had to remove it. No other application was used. On January 30th the man was brought to Nashville, where he was sent to Convalescent Barracks, and several days afterwards to hospital No. 22. At that time he was in good general health. There was slight tumefaction below the external malleolus and the foot was everted, its inner border being nearly thrown in contact with the ground, giving the foot a splay appearance. Below the internal malleolus a prominence existed corresponding to the rounded head of the astragalus, and great and deep-seated tenderness was experienced on pressure upon the astragalo-scaphoid articulation. The most remarkable circumstance of the case was the very slight inflammation in and around the joint. The case was diagnosed as a luxation of the astragalo-scaphoid articulation, and no treatment was deemed advisable nor reduction attempted for the reason that, having been so long delayed, it would have been necessary to break up the new adhesions, it being feared that the resulting inflammation would prove uncontrollable. Locomotion remained much impeded and the patient's condition continued unchanged up to March 10, 1863, when he was discharged as unfit for further service and returned to his home. The history of the case was contributed by Surgeon L. W. Beckwith, 38th Indiana. There is no record of the man ever having applied for pension.

Simple and Compound Fractures.—The total number of injuries of this group was seven thousand and four, of which five hundred and twenty-six, or 7.5 per cent., were fatal. Four thousand three hundred and forty-six, with seventy-six deaths, were specified as simple fractures; one thousand three hundred and seventy-one, with three hundred and ninety-seven deaths, as compound fractures; and one thousand two hundred and eighty-seven, with fifty-three deaths, as fractures merely. Instances of fractures of the cranium and of the vertebræ have been cited on pages 42 to 68 and pages 426 to 429 of the *First Surgical Volume.* Examples of fractures of the bones of the face, of the ribs, the sternum, the clavicle, the scapula, the ilium, and the bones of the extremities will here be detailed.

CASE 961.—*Fracture of the lower jaw from the kick of a horse.*—Assistant Surgeon S. C. Sanger, 6th New York Cavalry, reported the following history of the case of "a contused and lacerated wound in connection with fracture, which was incurred accidentally. The patient was kicked by a horse. The 'heel cork' or iron projection of the shoe impinged the anterior aspect of the lower jaw a little to the right of the symphysis, and drove inward a large portion of the alveolar process to which six teeth were attached. It was determined to place the fragment *in situ.* This was difficult because the fracture was impacted at the point where the blow was received and the separated bone was drawn inward by the upper fibres of the genio-hyo-glossus muscles. But the object was finally accomplished by extracting a tooth from the sound portion of the jaw, when the fragment was secured in its place by silk cord and silver wire, two small braces made of cork being placed between the movable teeth and the corresponding ones of the upper jaw. The patient was sent to General Hospital. The accident happened June 19, 1863, and on August 18th the patient arrived back in camp and reported for duty. An examination made showed that the bone had united perfectly and without any perceptible deformity, but little trace of the severe laceration of the soft parts being discerned in the well-shaped and scarcely apparent cicatrix." This case has been identified as that of Farrier J. O. Bivins, Co. B, 6th New York Cavalry, aged 32 years, who entered Emory Hospital, Washington, three days after the date of the injury, and was returned to duty August 13, 1863. He was mustered out of service September 19, 1864, and has since then filed an application for pension.

CASE 962.—*Fracture of the lower jaw by a fall from a horse.*—Private L. P. Towers, Co. F, 3d Ohio Cavalry, aged 48 years, sustained a simple oblique fracture of the lower jaw by falling from his horse December 1, 1864. The injury was located about an inch to the right of the symphysis, its track being from above downward and forward. Two days after the accident the injured man was admitted to Crittenden Hospital at Louisville. He had lost nearly all his teeth except the incisors, and various surgical dressings were applied to retain the fractured parts in position, but without success. On December 18th Acting Assistant Surgeon A. H. Hoy administered chloroform and made an incision two inches long over the seat of the injury, after which holes were drilled through the fractured ends of the bone and a small iron wire was passed through. The fracture was then reduced and retained in place by twisting the wire, an ordinary retentive apparatus being placed under the chin and fastened over the top of the head. With the help of some little traction the wire came away, bringing with it two small necrosed fragments, on January 7th, at which time not a particle of union had taken place between the parts. Two weeks afterwards the patient was granted permission to leave the hospital for a short time and came back intoxicated. Violent gastritis then supervened, and death resulted on January 24, 1865. At the *post-mortem* examination a second fracture was discovered, being situated in the left condyle and extending obliquely downward and inward. The mucous coat of the stomach was in a state of intense acute inflammation and some inflammation existed in the duodenum and jejunum. The injured maxilla, contributed to the Museum, with the history of the case, by Surgeon R. R. Taylor, U. S. V., is numbered 4246 of the *Surgical Section.* The specimen shows a portion of the body of the bone at the seat of the fracture to be wanting, both ends of the fragments being carious and necrosed and both condyles carious.

CASE 963.—*Fracture of the sternum; railroad accident.*—Private R. Boyle, Co. A, 3d New Jersey, met with a railroad accident on April 3, 1862, and was admitted to hospital at Alexandria several days afterwards. Surgeon J. E. Summers, U. S. A., described the injury as a "transverse fracture of the sternum between the articulations of the third and fourth ribs, with displacement, the fractured ends sliding upon each other and shortening the bone one and a half inches. From the posteriorly curved condition of the spinal column there is reason to think that there was crushing of the first and second dorsal vertebræ, although there was no paralysis of any of the limbs or organs. The patient is much crippled in appearance, but is evidently recovering, although slowly, with considerable deformity." The patient was discharged for disability resulting from his injury June 16, 1862. He is not a pensioner.

CASE 964.—*Fracture of ribs by a fall from a horse.*—Lieutenant E. Whitfield, Co. I, 22d New York Cavalry, aged 29 years, was injured in the right side by falling from his horse near Leesburg, July 12, 1864. Acting Assistant Surgeon A. Edelin, who attended him at Washington, reported that the injury involved a "fracture of ribs, which had not yet united on October 19." Several weeks later the patient obtained a leave of absence, and on December 19, 1864, he was discharged from service and pensioned. Examiner J. D. Button, of Auburn, N. Y., certified, February 9, 1870: "The sixth and seventh ribs on the right side were fractured and dislocated from the sternum, and not being properly adjusted an imperfect cure was the result. There is a projection of two inches outward from the chest at the ends of those two fractured ribs, which are not joined to the sternum. The muscles which move the arm are weakened and exercise causes pain." Subsequent examiners report the existence of an ulcer on the left thigh, alleged to be the result of a wound of the knee by a spent ball, which was also corroborated by the Auburn Examining Board. The latter, on December 5, 1877, described the projection caused by the fractured ribs, and added that the pensioner "has an anxious expression of countenance; distended nasal alæ; respiration easily disturbed; loud resonance and weak respiration in right lung, indicating emphysematous condition of the lung." The pensioner was paid September 4, 1881.

CASE 965.—*Fracture of ilium from a fall under a horse.*—Major W. E. Bryan, 3d New Jersey, aged 41 years, was injured in the right hip by his horse falling upon him, near Brandy Station, February 22, 1864. Two days after the accident he was conveyed to Washington, where he entered Armory Square Hospital and afterwards Georgetown Seminary. Surgeon D. W. Bliss, U. S. V., in charge of the former, and Surgeon H. W. Ducachet, U. S. V., in charge of the latter, both described the injury as a "fracture of the right ilium." Subsequently the patient was treated for a time in private quarters, and on June 23, 1864, he was discharged from service, since when he has become a pensioner. The Philadelphia Examining Board, consisting of Drs. J. Collins, T. S. Harper, J. H. Sherwood, and E. A. Smith, certified, February 7, 1872: "The pensioner sustained a fracture of the crest of the right ilium. He complains of constant pain and inability to follow any occupation, looks delicate, and carries the right hip somewhat higher than the left." Subsequent examining boards reported, in 1875 and 1877, that "the hip is flattened and the leg slightly shorter than its fellow. He alleges pain and fatigue in the hip, and has oblique inguinal hernia of right side, well supported by a truss." The pensioner was paid June 4, 1881.

FIG. 363.—Bones of the right forearm. *Spec.* 1784.

FIG. 364.—The left scapula transversely fractured. *Spec.* 1631.

CASE 966.—*Fracture of scapula, humerus, and forearm; railroad accident.* John Gazell, a laborer of the Commissary Department, U. S. A., aged 36 years, was run over by a city passenger railroad car at Washington, August 10, 1863, and died at Douglas Hospital one hour after the accident. Acting Assistant Surgeon J. E. Smith made the following report of the injury: "Everything to alleviate his sufferings was done that could be, but the man did not react from the shock in the least. At the autopsy a tumor was observed on the right side of the throat which was supposed to have resulted from the injury, but on cutting down upon it I discovered it to be a pre-existing enlargement of the thyroid gland. A section of the tumor displayed fatty degeneration of the greater part with two sacs, each containing about one-half ounce of sero-sanguinolent fluid. The left inferior portion of the tumor was ossified. Previous to his death the patient had passed bloody urine which could not be satisfactorily accounted for, the kidneys, ureter, and bladder being found apparently uninjured. The right humerus was comminuted, as were also the radius and ulna of each forearm. On the left anterior side the ribs were all broken except the twelfth, and the lung was considerably lacerated; posteriorly the same ribs were fractured except the first, second, and twelfth. The left scapula was transversely fractured below its spine and the left clavicle at its acromial extremity." The injured scapula (FIG. 364, *Spec.* 1631), humerus (*Spec.* 1786), and both bones of both forearms (FIGS. 363, 365, *Spec.* 1784 of the *Surgical Section* of the Museum), were contributed by Assistant Surgeon W. Thomson, U. S. A., and are represented in the adjoining wood-cuts. The left radius and ulna show an oblique fracture at the junction of the upper thirds, the superior fragments being wanting, while in the right radius a nearly transverse fracture exists in the lower part of the middle third and longitudinal fractures occupy the lower fragment. The lowest third of the right ulna is comminuted.

FIG. 365.—Bones of left forearm, obliquely fractured. *Spec.* 1784.

FIG. 366.—Upper portion of left humerus. *Spec.* 3311.

CASE 967.—*Fracture of humerus from the blow of a club.*—Private W. Jordan, 1st Alabama Colored Artillery, aged 27 years, was wounded at the battle of Fort Pillow, April 12, 1864, and entered Mound City Hospital two days afterwards. His injuries consisted of a comminuted shot fracture of the left ankle, flesh wounds of the left arm and right thigh, and a comminuted fracture of the superior portion and head of the left humerus, inflicted by a club. The wound of the ankle became very painful and the soft parts much inflamed. Amputation at the middle third of the leg was performed by Surgeon H. Wardner, U. S. V., on April 15th, chloroform and ether being used and three ligatures applied. The patient was in good condition at the time of the operation and seemed to do well for several days, when hæmorrhage took place from the tibial artery, which was checked by the application of persulphate of iron. Death, from pyæmia, took place on April 23, 1864. The upper portion of the injured humerus and the amputated bones of the leg, contributed with the history of the case by the operator, constitute specimens 3311 and 3312 of the *Surgical Section* of the Museum. A representation of the former appears in the annexed wood-cut (FIG. 366).

CASE 968.—*Fracture of the bones of the elbow; railroad accident.*—Private P. Stutz, Co. A, 91st Pennsylvania, met with a railroad accident on April 9, 1864, and entered South Street Hospital at Philadelphia, whence Acting Assistant Surgeon J. F. Koerper reported the case as a "compound fracture of the right elbow, cured with partial mobility of the joint. The patient stated that while on his way from Chester to Philadelphia he attempted to alight from a railroad car, when the sudden starting of the train caused him to fall and the wheel to strike his elbow. He was brought to this hospital soon after the accident. The parts were much swollen and contused, and crepitation could be felt around the joint. The wound on the inner side, a little above the joint, communicated with a detached piece of the internal condyle. Hæmorrhage, though not very profuse, was controllable only by pressure on the brachial artery. Cold-water applications were used to the joint, and angular splints were applied to the posterior surface of the arm. Ten days after the accident the swelling had become reduced, and by May 15th the wound was healed and slight movements of the arm had been restored. Only simple bandages were now used, and the patient was detailed for light duty. By September 1st the patient had almost recovered the entire use of the arm. He deserted from the hospital on October 11, 1864."

CASE 969.—*Fracture of the bones of the forearm; railroad accident.*—Private W. Call, a substitute, aged 19 years, was severely injured in the right forearm by a railroad collision at Madison, Wisconsin, December 30, 1864, and entered Harvey

Hospital the following day. The limb was found to have suffered a compound comminuted fracture of the radius and ulna at the lower fourth and a simple fracture of the radius at the upper third. The radial and ulnar arteries and large nerves were intact. In the course of several weeks inflammation resulted, the arm, forearm, and hand becoming greatly swollen from effusion of serum and blood into the cellular tissue, bullæ existing on the dorsum of the wrist, and the skin being very sensitive. Healthy pus was freely discharged from the openings. The patient, though in possession of medium strength and appetite and having a naturally good constitution, was suffering from intermittent fever, deranged secretions, and much emaciation. On February 11, 1865, Surgeon H. Culbertson, U. S. V., made an incision four inches long over the radius, extending upward from the wrist on the dorsum of the forearm, separated the soft parts down to the ulna and removed five loose pieces of radius and ulna, together with one-quarter of an inch of the lower end of the latter, from the seat of the fracture. An incision was also made through the integuments of the radial and ulnar borders of the dorsum of the hand to liberate the effusion of blood and serum. The lips of the upper wound were then approximated with sutures and plaster, being left open at the seat of the fracture below and filled with lint, and light poultices were applied over the seat of the fracture as well as over the dorsum of the hand; arm placed in a fracture box filled with tow. One grain of morphia was given immediately after the operation, to be followed with such doses as the patient might need. Whiskey, quinine, and muriated tincture of iron were prescribed, with good diet. About one month after the operation the external wounds were healing up, the swelling having subsided and the patient's constitutional state continuing good. On April 21, 1865, he was returned to the Post Commander, having entirely recovered. The history of the case was reported by the operator. There is no record of Private Call ever having applied for pension.

CASE 970.—*Fracture of the femur from a fall under a horse.*—Sergeant D. F. Mansfield, Co. F, 91st Pennsylvania, aged 37 years, was admitted to Harewood Hospital, Washington, January 18, 1865, suffering from great deformity of the right thigh, the result of a simple fracture of the femur at the middle third, the injured parts not having been properly adjusted. The injury occurred near the Weldon Railroad November 29, 1864, by a horse falling upon the man. At the time of admission the deformed limb was of no use whatever to the patient and locomotion was impeded, although the fractured parts were firmly united. The constitutional state of the patient otherwise was good. On January 28th Surgeon R. B. Bontecou, U. S. V., refractured the limb, after which a straight splint and counter-extension were applied. An anæsthetic consisting of chloroform and sulphuric ether was used. The patient did well after the operation, the parts uniting symmetrically. On March 13th the splint and extension were removed, when the fractured parts were found to be firmly united and the limb was placed in a plastic bandage. The patient continued to do well. On April 6th the plastic bandage was removed and the patient was allowed to be up on crutches, the fractured limb being one and a half inches shorter than the other, but firm and of perfect use. The history was reported by the operator. The patient was discharged from service June 24, 1865, and pensioned. Examining Surgeon O. I. Beach, of Parkerville, Kansas, May 19, 1873, certified to the injury resulting in shortening of the limb, and added that there is "displacement of the patella downward, causing much weakness in the leg; muscles placid. Complains of constant numbness and occasional severe pain in the leg, restricting locomotion," etc. The pensioner died of consumption April 17, 1875.

CASE 971.—*Fracture of the femur caused by a fall from a bridge.*—Private F. Buob, Co. C, 108th Ohio, aged 36 years, was admitted to the Government Hospital for the Insane near Washington on May 16, 1865, his condition being described by the superintendent, Dr. C. H. Nichols, as follows: "The patient's mental condition was that of slight chronic dementia. He was not able to walk up stairs to the ward on account of a lameness of the left hip, the sergeant in charge of him stating that this was caused by a fall from a bridge, which had occurred between two and three weeks previous to his admission. His own statement was that in marching across the bridge at night he was accidentally crowded off the side and fell down some distance, striking upon his left hip. As he laid upon his back the injured limb appeared shortened and the toes turned toward the other foot. By measurement the shortening was found to be three-fourths of an inch. The trochanter was flattened and approximated to the anterior superior spinous process of the ilium. On rotating the limb no point of false motion was discovered and no crepitation. The arc of the movement of the trochanter was less than that of the sound side. When the patient stood erect there was the same shortening and the same inversion of the foot. He could limp about a little by the aid of a chair, bearing considerable of his weight upon the injured limb. The diagnosis of the case was that of an impacted fracture of the neck of the femur. The limb improved rapidly, and in a few weeks the patient walked without inconvenience excepting what arose from the shortening. The general appearance of the man, however, led to the suspicion of pulmonary tuberculosis, and a physical examination of the chest confirmed this suspicion. The tuberculosis advanced with the ordinary phenomena of cough, expectoration, some hæmoptysis, and occasional pleuritic and pneumonic inflammation. From this disease the patient died January 28, 1866. The *post-mortem* examination of the body proved the correctness of the diagnosis respecting the lung disease. Nothing peculiar was noticed about the acetabulum of the injured side except that the ligamentum teres and the cushion of fat at the bottom were more vascular than on the sound side. The femur presented unmistakable evidence that the injury was an impacted fracture of the neck of the bone, the line of it being partly within and partly without the capsular ligament. By comparison with the sound femur a shortening of three-fourths of an inch was shown, and the impaction was found to be greater anteriorly than posteriorly, thus causing the inversion of the foot. The union of the bone appeared to be firm and sound." Both the injured and the sound femur were contributed to the Museum by the reporter of the case and constitute specimen 2376 of the *Surgical Section*.

CASE 972.—*Fracture of the patella.*—Lieutenant J. H. Sullivan, Co. G, 1st Regiment Potomac Home Brigade, aged 27 years, was thrown out of a wagon on July 24, 1864, striking his knee on the stone pavement and fracturing the patella. The bone was split into three fragments, there being one outer lower, one inner lower, and one larger upper piece. The patient was admitted to the General Hospital at Frederick on the day of the injury. Anti-inflammatory treatment, such as ice and evaporating lotion, was used to the joint, and a straight splint was applied to the back of the limb, coaptation being made by compress above and below the bone, drawn and pressed together by adhesive plaster. The limb was kept elevated during part of the treatment on an inclined plane. After union had taken place a plaster of Paris splint was applied to enable the patient to go about. On October 20, 1864, he returned to his regiment to be mustered out, his term of service having expired. At the time of leaving the hospital the patient had recovered from his injury with short ligamentous union. The case was reported by Acting Assistant Surgeon J. H. Bartholf. The patient has never applied for a pension.

CASE 973.—*Fracture of the tibia.*—Sergeant-Major J. L. Keys, 18th Pennsylvania Cavalry, was admitted to Frederick Hospital July 13, 1864, with a chronic indolent ulcer of the right leg, the result of an old fracture of the tibia. Assistant Surgeon R. F. Weir, U. S. A., recorded that the ulcer was treated by straps and stimulant applications and became much diminished in size. On September 25th the patient received a furlough for thirty days, and when he returned he showed evidence of protracted intoxication. Symptoms of *mania a potu* soon after prevailed, and, though subdued for periods by treatment, resulted fatally on October 26, 1864. At the autopsy the body was found to be well nourished, the lungs healthy, and a large deposit of fat on the outer surface of the heart. The liver was much enlarged and decidedly fatty; kidneys fatty; spleen and intestines healthy; omentum very large; stomach very much contracted, its coats being intensely thickened, the rugæ remarkably prominent, and the mucous membrane much congested. On removing the calvarium the membranes were found to be much congested, with slight effusion between the arachnoid and pia mater, slight deposit of lymph on the pia mater and considerable effusion beneath. The substance of the brain was quite firm. A section of the injured tibia was presented to the Museum and forms specimen 3932 of the *Surgical Section*, showing the old consolidated fracture followed by a spongy and carious condition of the anterior portion of the bone.

FIG. 367.—Consolidated fracture of tibia. *Spec.* 1057.

CASE 974.—*United fracture of the tibia.*—Specimen 1057 (FIG. 367) was contributed to the *Surgical Section* of the Army Medical Museum by Assistant Surgeon E. Coues, U. S. A., and consists of a portion of the shaft of the tibia, exhibiting a simple oblique fracture firmly consolidated. Death occurred from an independent cause.

CASE 975.—*Fracture at the ankle joint.*—Captain T. M. Howrigan, Co. H, 1st Michigan Cavalry, aged 37 years, suffered a fracture at the left ankle joint while passing through Washington, November 11, 1862. The accident was occasioned by his horse becoming frightened and falling with him, causing his left foot to be caught under the horse and to be fractured. He was discharged for disability June 30, 1863, but re-entered his regiment as Major several months afterwards, and remained in service until ultimately mustered out June 19, 1865, since which date he has become a pensioner. Examining Surgeon J. A. Brown, of Detroit, Michigan, August 11, 1869, certified to the fracture and to the tibia being partially dislocated at the ankle, and added that "motion and strength of the foot and ankle are considerably impaired." The Kansas City Examining Board reported, September 4, 1873: "Upon careful examination we find fracture of the tibia and fibula and dislocation of the internal malleolus, it being projected inward and downward, with tumefaction and pain. Close to the femur and femoral vessels at the upper third of the thigh there is found an osseous deposit about six and a half or seven inches long, one and a half inches wide above and tapering off in a wedge-shape below, and one-half inch thick, and just above this there is a smaller deposit, being two inches long and one inch wide. These deposits interfere materially with the circulation and mobility of the limb, which is atrophied and partially paralyzed. General health bad." The same board on September 8, 1877, reported the existence of "large varicose veins of the entire limb. He is feeble, very nervous, and quite lame, being compelled to support himself by a cane in walking. He is much more feeble now than two years ago, and unable to do manual labor." One year later the board reported that the pensioner "is now confined to his bed and has not been able to walk for several months. He has to have constant attendance and is not able to help himself." The pensioner died May 2, 1879. His attending physician, Dr. A. B. Sloan, of Kansas City, testified that death was caused by "exhaustion induced by ossification of the arteries in the lower limbs and the deposit of bony masses in his left thigh, resulting from the injury and exposure in the army."

Punctured, Incised, and Lacerated Wounds.—Thirty-six thousand nine hundred and seventy-five punctured and incised wounds, not including those caused by sabre or bayonet, were reported; five hundred and thirty had fatal terminations, a mortality rate of 1.4 per cent. The number of lacerated wounds is recorded as five thousand three hundred and eighty-four, of which one hundred and ten, or 2.0 per cent., ended in death.

CASE 976.—*Punctured wound of chest.*—Private B. McGinnis, Co. H, 7th Kansas, aged 31 years, was discharged from service at the General Hospital at Leavenworth City, December 29, 1863, Acting Assistant Surgeon S. F. Few certifying to the following disability: "He has been under treatment in this hospital since August 18, 1862, for a punctured wound of the right side below the axilla, caused by a knife in the hands of a comrade during a drunken quarrel. Chronic pleurisy exists, accompanied by empyema. The thoracic walls on the right side are much compressed, and there is dullness on percussion and almost entire absence of respiratory murmur in the right lung. There is discharge of fetid matter from a fistulous opening in front of the right axilla, and the patient's general health is much impaired." There is no record of this man ever having applied for pension.

CASE 977.—*Punctured wound of urethra.*—Passed Assistant Surgeon J. R. Tryon, U. S. N., reports that "J. Welsh, a seaman, aged 43 years, and of strong constitution, was admitted into the Naval Hospital at Pensacola June 29, 1864. He had been admitted on the sick list eight days previously with difficulty of micturition accompanied by inflammation of the spermatic cord and tunica vaginalis, and on June 28th he had ruptured the urethra by passing a sail needle for a bougie. At the time of the patient's admission to hospital the scrotum and perinæum were gangrenous, consequent upon extravasation and infiltration of urine in the surrounding cellular tissue, caused by the laceration of the urethra. The buttocks were swollen and inflamed, large quantities of pus escaping on incision. He was weak and faint, unable to void urine, and laboring under all the effects of a severe shock. Upon consultation it was decided that no operation could possibly be of benefit to the patient. A catheter was accordingly passed into the bladder after considerable difficulty; tonics and stimulants were freely administered, and the affected parts were dressed with liquor sodæ chlorinatis. On June 30th the patient was no better, being hectic and comatose, from which he could be easily aroused. Urine passed freely through the catheter. On July 1st there was no change. During the following night the patient removed the catheter; the scrotum sloughed away entirely and the testicles became exposed, with an ulcerated surface extending over the perinæum, and the buttocks filled with maggots, which seemed unavoidable from the extreme difficulty in keeping the parts clean and from the heat of the weather. On July 3d a gum-elastic catheter was again passed into the

bladder. The patient, however, failed rapidly, became fully comatose under all the depressing circumstances, and died in a pitiable condition on the morning of July 15, 1864. The autopsy revealed the stricture and point of rupture just external to the triangular ligaments. The severe symptoms of the case at the time of reception into the hospital render it highly doubtful whether the laceration of the urethra and extravasation of urine could have taken place only the day previous to admission, but under any circumstances should not the treatment in the first instance have been decisive, puncturing the bladder through the rectum (if the catheter could not be introduced) and making numerous and deep incisions into the affected parts?"

CASE 978.—*Punctured wound of knee joint.*—Private B. F. Carr, Co. G, 2d Minnesota Cavalry, aged 19 years, was wounded in the left knee during the engagement with the Indians near the Little Missouri River, August 8, 1864. He remained at a field hospital for two months and was then transferred to Fort Ridgely. Acting Assistant Surgeon A. Muller, in charge of the latter, certified to his discharge from service, February 1, 1865, by reason of "an arrow wound through the knee immediately below the patella, causing stiffness of the knee joint and considerable limping." Examining Surgeon B. R. Palmer, of Sauk Centre, Minnesota, reported, June 17, 1868: "An Indian arrow passed into the knee joint under the knee pan. There are evidences of extensive inflammation of the joint in numerous cicatrices around the joint. There is no anchylosis, but great irritability in the joint after exercise, and difficulty in walking far or standing long." Examiner J. M. McMasters on September 6, 1877, made a corroborating report of the nature of the injury, and stated that "an iron or steel arrow penetrated the knee joint. At present there is partial anchylosis of the joint, with dryness of the synovial membranes, indicated by cracking upon motion, and considerable tumefaction in the popliteal region." The pensioner was paid December 4, 1881.

CASE 979.—*Punctured wound of knee joint.*—Private T. A. Jackson, Co. H, 1st Rhode Island Cavalry, aged 23 years, is recorded by Assistant Surgeon E. J. Marsh, U. S. A., as having been admitted to Judiciary Square Hospital, Washington, April 29, 1863, with a "perforating wound of the left knee," and as having been transferred to Philadelphia one week afterwards. Acting Assistant Surgeon W. W. Keen, jr., reported the case as a "punctured wound of the knee joint" and described the injury as follows: "The patient was admitted to Satterlee Hospital May 7th. He stated that in the previous December he met with a fall from his horse, during which a pair of scissors from his knapsack punctured the knee joint and broke off; that the points were removed three days after the accident, being three inches deep according to the statement of his surgeon, and that severe inflammation followed and a large number of abscesses formed about the joint. At the time of the patient's admission the injured joint was smaller than the sound one, the hamstrings were contracted, and motion was limited from complete flexion to an angle of 135° with the thigh. Crepitation was very marked and motion of the patella much restricted. Just to the inside and above the tubercle of the tibia there was a cicatrix from a wound, and all about the joint old cicatrices from abscesses were found. The evidence was rather in favor of penetration of the joint, both by the position of the cicatrix mentioned and the escape of synovia, which seems probable from his statement, though of this he is not quite confident. The scissors were rusty when he was wounded. He walks about on crutches but is unable to bear weight on the limb." Surgeon I. I. Hayes, U. S. V., reported that the patient was discharged from service June 1, 1863, by reason of anchylosis of the left knee joint resulting from an injury by scissors penetrating the knee joint." The man is not a pensioner.

CASE 980.—*Incised wound of neck.*—Assistant Surgeon G. W. Hogeboom, 8th Kansas, reports that "Private S. Noyes, Co. K, 13th Wisconsin, was admitted to hospital at Leavenworth, May 28, 1862, with a partially healed incised wound across the throat, running diagonally from left to right and crossing the trachea just below the pomum adami. He was sent here from the Lawrence Hospital and no account came with him of the injury, which is said to have been inflicted by himself with a bowie knife while laboring under a temporary aberration of mind some time in March. When I first saw him the wound was discharging healthy matter and there was some hoarseness of voice and expectoration of considerable quantities of pus at times; pulse 70, full, soft and regular; general condition of system very good; mind sound. There was no apparent opening from the external wound into the trachea. It soon, however, became evident that there existed some obstruction to the closing up of the wound by granulation, and from time to time thorough search was made for any deep-seated abscess and for sinuses connecting therewith. From the character of the sputa at times I feared that there might exist such connections with the trachea internally, but failed in every attempt to find any leading from the external wound. The patient's general condition, though every effort was made to find the true seat of the difficulty, continued much the same until the morning of June 29th, when his hoarseness was a great deal worse and accompanied with great difficulty of respiration and increased frequency of pulse attended with considerable hardness. I immediately put him on calomel and tartar emetic in pretty liberal doses. By 6 P. M. the symptoms were in a measure relieved. The treatment was continued through the night. At 8 P. M. on the following day the dyspnœa was still aggravated and the patient's blood greatly in need of oxygenation. I then sent for instruments for the purpose of performing tracheotomy, but before the operation could be done the patient expired asphyxiated. At the *post-mortem* examination I found an old sinus communicating with the trachea from behind, just below the chordæ vocales, leading to an abscess below and immediately behind the opening into the trachea. The trachea was contracted from behind to less than one-third its normal size, and following it closely a very tortuous and small sinus connected the abscess also with the external wound. Sub-acute inflammation extended in a limited degree to the larger bronchia, and patches of false membrane were found on the right side of the trachea. Other organs healthy."

CASE 981.—*Incised wound of abdomen.*—Private J. Mooney, Co. G, 1st California Cavalry, was stabbed with a knife by a fellow soldier May 18, 1863. He was conveyed to Camp Stanford Hospital at Stockton, whence Surgeon W. W. Hays, 6th California, made the following report: "When first seen, about three-quarters of an hour after the injury, I found a wound in the left side of the abdomen extending from about the centre of the seventh rib three inches diagonally toward the umbilicus, and another in the back, on the left side of the second lumbar vertebra, extending upward and across the vertebral column for about two and a half inches. About three feet of the small intestine, with some omentum, was lying upon the external surface of the abdomen, being partly cold from exposure to the air and distended with gas. By gentle manipulation all was reduced in about half an hour, and the wound was closed by interrupted sutures. The wound in the back bled freely and was only controlled by an injection of sulphate of iron. The treatment consisted of the free use of opium, half a grain being given every hour during the first twenty-four hours, and low diet. On the third day the bowels were opened by an enema and afterward by a full dose of castor oil. Very little inflammation occurred, and that was controlled by opium and cold water. The patient improved rapidly,

and to day (May 31st) he is walking about the camp, although the wound in the back is still discharging slightly." About two months after the occurrence of the accident the patient was admitted to hospital at Camp Drum, whence Surgeon S. S. Todd, 4th California, reported his discharge from service September 6, 1863, by reason of "ventral hernia."

CASE 982.—*Incised wound of knee.*—Private R. Moody, Co. G, 118th New York, aged 24 years, entered Turner's Lane Hospital, Philadelphia, May 23, 1864, and was discharged for disability seven months afterwards. Acting Assistant Surgeon W. W. Keen, jr., contributed the following history of the case: "The patient had been struck by an axe in the right leg, just below the patella, during the fall of 1862. The axe severed the ligamentum patella, but he states that no synovia escaped and but very little blood. He was sick in bed for five months and then got up, having no anchylosis and the great primary swelling having disappeared. In December, 1863, he enlisted in the army, having good use of the limb, though he could not run nor walk rapidly without care. He states that within the last six weeks the patella has been drawn upward, and that before then it had almost kept its normal position. He now constantly requires a cane and cannot extend the limb by the quadriceps muscle. No anchylosis exists." The cast (*Spec.* 6692, A. M. M.) was taken by Dr. Keen at the time of the patient's admission to Turner's Lane Hospital, and shows the position of the patella, also the scar and resulting deformity, the limb being flexed. Some years after his discharge the man claimed a pension for disability from diarrhœa, etc., alleged to have originated in the service, and was inspected by Examining Surgeon T. C. Noyes, of Oshkosh, Wisconsin, who in connection with the case mentioned the condition of the injured limb on August 19, 1880, as follows: "I find the right thigh atrophied from hip to knee, with slight paralysis. Its size above the knee is three inches smaller than the left, somewhat weaker, and uncertain in movement."

CASE 983.—*Lacerated wound of leg.*—Private J. Farrell, Co. B, 132d New York, aged 21 years, was severely injured by an explosion at Bachelor's Creek, May 26, 1864. Surgeon C. A. Cowgill, U. S. V., reported his admission to Foster Hospital at New Berne with "extensive laceration of the popliteal space of the left lower extremity." Four months after receiving his injury the patient was well enough to leave for his home on furlough. He subsequently entered Ladies' Home Hospital, New York City, and lastly McDougall Hospital, whence he was discharged from service June 16, 1865, and pensioned. The New York City Examining Board certified to the injury on November 23, 1870, and stated that "the outer hamstring muscles were carried away, causing partial paralysis of the left foot. The cicatrix is eight inches in length by three in width." Five years afterwards the same board reported that "the strength of the knee joint is greatly impaired; complete paralysis of foot at the ankle joint and also of the toes; foot cold and badly nourished." The pensioner was paid September 4, 1881.

CASE 984.—*Lacerated wound of leg.*—Private P. Berrer, Co. I, 3d New Jersey Cavalry, aged 26 years, was kicked in the left leg by a horse on March 14, 1864. He was admitted to hospital at Philadelphia, where simple dressings were applied and where he remained until June 19th, when he was transferred to Ward Hospital at Newark. At the latter place the injured limb was operated upon by Assistant Surgeon J. T. Calhoun, U. S. A., who made the following report of the case: "The site of the limb kicked by the horse was on the anterior aspect, at the junction of the middle and upper thirds of the tibia. A lacerated wound was produced and the bone was laid bare. In the course of some months a large and unhealthy ulcer developed itself, covering the whole face of the lower upper third and upper part of the middle third of the tibia and causing profuse suppuration. On November 8th an anæsthetic of ether and chloroform was administered and an incision three inches long was made, after which a sequestrum four inches long was extracted with a bone forceps and carious bone was removed by means of a gouge. The patient's general health at the time of the operation was in a fair state. His subsequent treatment consisted of simple dressings, stimulants, and full diet. The wound did well for a time, but prospects of complete recovery remained remote and indifferent at the time of the patient's discharge from service on April 8, 1865." The Philadelphia Examining Board reported, September 4, 1875: "On the inner side of the injured leg there is an extensive scar, which involves fully one-half of the surface. The tibia is enlarged and the scar is hard and discolored. It has been open recently, but is now nearly healed." Two years later the same board described the scar as discharging pus and the limb as greatly discolored and hypertrophied. The pensioner was paid June 4, 1881.

Other Accidents and Injuries.—Of fifteen thousand two hundred and seventy-three injuries of various kinds, grouped in this class, one thousand and seventy-five were fatal, a mortality of 7.03 per cent. A large number of these cases were injuries from frostbite.

CASE 985.—Private A. Zufall, Co. C, 142d Pennsylvania, aged 21 years, had his feet frost-bitten in the field during the month of January, 1863. After undergoing treatment in field hospitals for several months, he was transferred to Washington and subsequently to Philadelphia. Acting Assistant Surgeon R. M. Girvin reported that at the time of the patient's admission to Satterlee Hospital, June 23d, his feet were swollen and purplish looking and he had not been able to wear his shoes for five months. He was doing well and no treatment was required. The patient was returned to his regiment for duty on December 2, 1863. At the battle of the Wilderness, May 5, 1864, he received a gunshot flesh wound in the left thigh, for which injury he was again treated in various hospitals. He was ultimately mustered out of service May 29, 1865, and pensioned. Examining Surgeon H. Brubaker, of Somerset, Pennsylvania, reported, November 4, 1874: "The toes of both feet are stiff and the feet are very tender from the presence of chilblains, which become very troublesome during the winter, when he is unable to wear shoes most of the time." Examiner S. L. Good, of Meyersdale, Pennsylvania, March 15, 1880, certified to "loss of motion of the toes of both feet; cold and imperfect circulation. He states that the feet are numb and get cold easily. He cannot walk much." The pensioner was paid December 4, 1881.

CASE 986.—*Frostbite of both feet.*—Private L. S. Cronkhite, Co. I, 40th Indiana, aged 46 years, was taken prisoner at the battle of Franklin, November 30, 1864, and had his lower limbs frozen by exposure during his captivity, which lasted for several months. Assistant Surgeon J. A. White, U. S. V., reported that he was admitted as a paroled prisoner to McPherson Hospital at Vicksburg, April 2, 1865, suffering from "frostbite of both feet," subsequent to which date the patient passed through various hospitals until August 31, 1865, when he was mustered out of service. Having made an application for pension, he was examined on December 31, 1880, by Examining Surgeon J. T. French, of Knoxville, Iowa, who described his condition

as follows: "He has suffered from frozen feet. The flesh has sloughed off both the great toes and inner side and bottom of the feet, causing extensive contraction of the tendons. He is unable to walk or attend to ordinary farm labor, rendering his disability equal to one-half of total."

CASE 987.—*Struck by lightning.*—Private S. Millard, Co. K, 52d Pennsylvania, aged 20 years, was struck by lightning while doing guard duty near Port Royal, May 13, 1864. He was treated at the regimental hospital and subsequently at the General Hospital at Hilton Head, whence Assistant Surgeon J. F. Huber, U. S. V., reported the case, stating that "the electric fluid passed down the man's body in a zigzag direction and burned the body in its course." The patient is recorded as having been returned to duty three months after the occurrence of the accident. He was ultimately mustered out of service July 12, 1865, and afterwards allowed a pension. The following detailed account of the case was subsequently contributed by Dr. J. B. Crawford, of Wilkesbarre, Pennsylvania, who at the time of the accident held the rank of regimental surgeon of the 52d Pennsylvania volunteers: "I saw the man about ten minutes after the reception of his injury. He laid upon the ground apparently dead. No pulsation of the heart could be felt, no respiration could be observed, nor could any symptoms of life be discovered. There was complete relaxation of the muscles and the pupils were much dilated. The electric fluid seemed to have first touched the point of the bayonet, about one inch of which was melted. The brass buckle of his belt, his steel watch-chain, and the larger portion of the silver casing of the watch were also melted. The hair was burned from his chest and pubes, and the skin of nearly the whole anterior portion of his body was more or less deeply burned. The injury to the skin was most severe about the pubic region, where some sloughing subsequently took place. Passing down the legs the fluid singed the hair and slightly burned the skin on the anterior surface of each limb. The soles of his boots were completely torn off, and no trace of them, with the exception of a few small portions left attached, could be found. No marks of the electric fluid were made upon either of the upper extremities nor upon the head or the neck. It seemed to have first touched him below the clavicle and to have descended over the anterior portion of the body, where it left its visible traces. The woolen shirt which he wore at the time was also much burned and was still smoking when I reached him. At first I had no thought of making any attempt at resuscitation, but while awaiting the arrival of a stretcher for the purpose of removing the body I decided to try the effect of artificial respiration. No appliances for this purpose, however, were at hand, and my only resource was to compress and expand the chest, depending on the elasticity of its walls and on the forcible elevation of the arms for means of expansion and inflation, and on direct compression of the chest with the hands for expiration. Being aided by my assistant, Dr. J. Flowers, I proceeded to carry out my purpose, the relaxed state of the muscular system seeming to facilitate the proceeding greatly. Ammonia was applied to the mouth and nose while the forced respiration was being carried on. After continuing this procedure for a quarter of an hour or more, and when about despairing of success, we were rewarded by what seemed to be a faint gasp in our patient—so slight, indeed, that we were not quite sure of its reality, yet enough to induce us to persevere in our efforts. We soon saw more unequivocal signs of life, and at the expiration of half an hour we could detect positive evidence of the heart's action, which was feeble and exceedingly slow, not amounting to more than thirty-five beats per minute. After continuing the treatment for another half hour our patient was so far restored that we had him conveyed to the regimental hospital. As he was yet unable to swallow, ammonia was given by inhalation, and whiskey was freely applied to the surface of the body. After the expiration of some hours the patient became able to swallow small quantities of liquid; the limbs and organs of speech, however, remained paralyzed. He continued in a similar condition for about five days, the bowels being constipated and the urine passing involuntarily. Sensibility seemed to have been lost. On the sixth day after the injury a slight improvement in all the suspended functions was apparent. The voice gradually returned; movements of the limbs again became possible; the bladder and bowels gradually resumed their wonted action, and sensibility and motion returned by slow and uniform degrees. At the expiration of three weeks I left for the north and lost sight of the patient, who was then able to walk a few rods with the aid of crutches. Some three years afterwards he applied to me for a certificate on which to found a claim for a pension. At that time he had not fully recovered, sensibility and motion being still impaired. His gait was unsteady and his movements tremulous and feeble; his pulse had regained its normal frequency and force. His condition still continued to improve, and at the expiration of another year he was able to attend to some light labor. I again saw the man in July, 1873, when he told me that he had nearly recovered from his injury and had resumed his trade as wagon-maker. He also stated that he enjoyed tolerable health, and experienced none of the ill effects of his injury except on the approach of and during a thunder storm, at which time he would feel excruciating pains throughout his system," etc. In consequence of adverse reports by the examining surgeons the pensioner's name was dropped from the rolls on March 4, 1869, since when he has made ineffectual attempts to be restored. The Scranton, Pennsylvania, Examining Board certified, on March 7, 1877, to "reflex paraplegia consequent on the general electric shock of such intensity as to disturb the co-relation of the nerve centres. While it did not utterly destroy, it has so far impaired the neural force as to give rise to loss of power by exhaustion more or less complete and to consequent occurring nutritive changes."

CASE 988.—*Struck by lightning.*—Sergeant W. Roberts, Co. C, 56th Ohio, aged 24 years, was struck by lightning while on the march from Jackson to Vicksburg, July 22, 1863. He was conveyed to hospital at Vicksburg, where he was under treatment for several weeks, after which he received a furlough and was allowed to proceed to his home. Surgeon L. R. Stone, U. S. V., reported that "the man was admitted from his home to the General Hospital at Gallipolis on February 9, 1864. At the time of his admission he could not walk, only shuffle along a few inches at a time, and could stand only when supported on crutches or canes. He showed considerable emaciation; appetite poor; pulse 120 and feeble; skin dry and cool. His mind was not at all affected. According to his account of the accident he had sought shelter in the woods during a heavy thunder storm and was standing under and against a tree, when he was struck senseless to the ground, one or two other soldiers being killed at the same time. He remained unconscious for some hours, but was at last resuscitated by the dashing of cold water and by friction, and was then removed to a hospital as soon as possible. The physician under whose care he was while staying at his home stated that at first he was nearly helpless, and in December there was yet no perceptible improvement in the case, his pulse being 125 and feeble, his emaciation considerable, and the use of his lower extremities being greatly impaired. Nothing was mentioned about the treatment employed. On examination of the patient after his admission here, well-marked general paralysis of the motor system was found, particularly of the lower extremities, with some slight insensibility, and a sluggish-

ness of the capillary circulation. There was no œdema nor subsultus tendinum. He could move his toes and partially flex his legs or his thighs, but could not walk. The upper extremities were somewhat affected, but in a much less degree; bowels very sluggish; no affection of the urinary organs. Though occasionally there were severe paroxysms of pain just below the scapulæ, no pressure at any particular point along the spine caused pain. Atmospheric changes affected the patient very much, and when the air was charged with electricity he showed considerable constitutional irritation, with fever, pain in the head and limbs, and nausea. This was followed by two or three days of depression before he would recover his usual condition. The treatment was principally chalybeate, with milk diet. The patient is slowly improving now (May 12th) and able to walk more easily with crutches, but is still quite feeble." At a subsequent date the patient was transferred to Columbus, where he was discharged by expiration of service on October 27, 1864. On making an application for pension he received the following certificate from Examining Surgeon W. G. Gill, of Decatur, Alabama, dated April 23, 1881: "I have carefully examined the applicant. He appears quite nervous, and says his left side gives him great pain when he exercises in attempting to do manual labor; that he has never been able to do a regular day's work since the war, and although partially recovered from paralysis caused by lightning, he still suffers very much. I rate his disability total."

CASE 989.—*Fatal case of sunstroke.*—Private C. Vaughn, Co. B, 1st Louisiana, aged 30 years, was sunstruck at New Orleans, and admitted to St. James' Hospital on September 16, 1863. Acting Assistant Surgeon J. V. C. Smith reported that "the patient was brought to the hospital in a state of unconsciousness. He could swallow nothing and occasionally had spasms of the lumbar muscles. He was carefully watched. Cold-water applications were made to the head, and mustard was applied to the back of the neck and to the soles of the feet. On the following day the patient's jaws were still spasmodically closed and nothing could be forced into his mouth. At 2 P. M. the ice was taken from his head and his whole body was washed in mustard water. His pulse was not much different from that of one in ordinary health. At 3 P. M., by some singular movement which no one saw—although he was in a ward of forty-three beds, mostly occupied, and the nurses were but a few feet off—he seemed to have rolled over and broken a wash-basin, a sharp edge of which cut a gash three inches in length across the masseter muscle of the left side of his face, nearly dividing it, and cutting in twain a branch of the transversalis faciei artery, which bled pretty freely. The artery was secured by a ligature and the wound was stitched and secured by adhesive strips. The patient groaned several times during the operation, but never recovered his consciousness nor took either nourishment or medicine while in the hospital. He died at 10 P. M. on September 17, 1863."

CASE 990.—*Injury from a scorpion bite.*—Private J. Sculley, Co. H, 6th New York Cavalry, aged 25 years, was stung by a scorpion on the back of the neck, between the third and fourth cervical vertebræ, while in camp at Fair Oaks, June 27, 1862. Surgeon A. P. Clark, 6th New York Cavalry, who treated the case, made the following report: "The patient was a man of robust constitution and of good health. I saw him a few minutes after the reception of the wound, which occurred at 10 A. M. There was no swelling of the part, but he complained of intense pain in the back and lower extremities. I cauterized freely. Severe spasms soon came on, producing in quick succession complete emprosthotonos and opisthotonos; pulse 55 and weak; pupils dilated; voice feeble; face livid; surface cold and bathed in clammy perspiration. He remained in this condition for two and a half hours, when he gradually became insensible, the action of his heart becoming more feeble and irregular. Ten minims of Bibron's antidotal mixture and a tablespoonful of brandy diluted with the same quantity of warm water was administered and repeated every half hour until two and a half ounces of the brandy had been given. During this time hot sinapisms, with diluted acetic acid, were kept applied along the spine and lower extremities. At 12 o'clock his face and hands began to swell, the skin of these parts resembling an attack of phlegmonous erysipelas, though of a duskier hue. The swelling continued to increase until about 6 P. M., at which time his head was of an enormous size and his eyes very glassy, appearing as if they would burst from their sockets. The swelling also extended down the neck and chest as far as the lower part of the pectoral muscles, down the arms as far as the insertion of the deltoid, and over the shoulder on either side of the wound; but there was none in its immediate vicinity or below it on the back. The patient still remaining unconscious, I took twelve ounces of blood from the left median cephalic vein and cupped him along the spine and lower part of the thorax, put two minims of croton oil upon his tongue, and administered an enema of warm water and olive oil. Sinapisms were still continued. About 2 A. M. on the following morning signs of returning consciousness appeared, when another enema was given and his feet were put into warm water. In about a quarter of an hour afterwards he had a copious discharge from his bowels, very offensive and of a dark gelatinous character, which was soon followed by the vomiting of a large quantity of matter of a similar but not so offensive nature. After this consciousness returned and the swelling gradually subsided. At 3 P. M. the patient was able to sit and ride in an ambulance. He reached Harrison's Landing on July 1st, when he reported to his company for duty. No untoward symptoms afterwards appeared. During the course of the first day some ten different medical officers saw the patient and none of them entertained any hope of his recovery. I am of the opinion that it was through the action of Bibron's antidote conveyed into the circulation that the virus of the scorpion was neutralized or eliminated from the system, and that the action of the medicine was promoted by the other measures employed."

Section II.

OPERATIONS FOR MISCELLANEOUS INJURIES.

Numerous operations for miscellaneous injuries or diseases, such as excisions, amputations, ligations, operations on the eye, the mouth and its dependencies, the air passages, the chest, the genito-urinary organs, etc., were reported during the war. Detailed reports will be given of the more important cases, and all will be cited in condensed tabular statements.

EXCISIONS.—Forty-five cases of excisions for miscellaneous injuries or diseases were reported. Twenty-five were excisions of the bones of the head, five of the upper extremities, and fifteen of the lower extremities. The results are indicated in the following table:

Table CV.

Numerical Statement of Forty-five Cases of Excisions following Miscellaneous Injuries or Diseases.

EXCISIONS.	Cases.				For Injury.			For Disease.	
	Total.	Recoveries.	Deaths.	Undetermin'd Results.	Recoveries.	Deaths.	Undetermin'd Results.	Recoveries.	Deaths.
Excisions of Cranial Bones	25	12	12	1	12	12	1	.....	.....
Excisions of the Scapula	1	1	.....	.....	1	.....	.....	.....	.....
Excisions at the Shoulder Joint	1	.....	1	.....	.....	1	.....	.....	.....
Excisions in the Shaft of the Humerus	1	1	.....	.....	1	.....	.....	.....	.....

Excisions in the bones of the Foot	2	2	.....	.....	1	.....	.....	1	.....
Aggregates	45	28	16	1	23	16	1	5	.....

The twenty-five cases of excisions of the cranial bones for injuries from miscellaneous causes have been detailed in the *First Surgical Volume*.[1] A few examples of excisions in the extremities will here be cited, and all will be given in tabular form.

Case 991.—*Excision in the bones of the leg.*—Private C. Peasley, Co. A, 10th Massachusetts, was kicked by a mule in the left leg, fracturing both bones, while driving ambulance at Camp Brightwood, August 31, 1861. He was admitted to the Washington Infirmary Hospital on the day of the injury. One month after the accident no attempt at union of the bone had yet taken place, but much suppuration had occurred and the bone had become bare in its whole circumference for the space of two inches. incisions were made anteriorly and posteriorly and resection of the tibia and fibula was performed. Firm union resulted three months after the operation, a gypsum apparatus being used during the last month. The patient was discharged from service December 17, 1861, and sent home. He had urgently requested that amputation be performed, but on careful examination it was deemed more prudent to saw off the dead bone which had not yet been cast off and to resort to amputation only in case of failure of the resection. The excised portion of the tibia (*Spec.* 346), represented in the adjacent cut (FIG. 368), and measuring one and one-fourth inches in length, was contributed with the history of the case by Assistant Surgeon J. W. S. Gouley, U. S. A. The patient became a pensioner after receiving his discharge. Examining Surgeon H. D. Train, of Sheffield, Massachusetts, September 7, 1872, certified to the injury and resection, "shortening the limb three inches. There is a perfect solidification at the place of fracture; no motion of ankle and instep. After slight exertion or during damp weather he has often severe pain, which prevents any labor. Since his discharge he has been obliged to lead a sedentary life from inability to walk. His general health is fair, but his system is generally weakened and sensitive to cold weather. The foot is gradually perishing, and the pensioner would have been infinitely better off to-day if amputation had been performed." Five years later the same examiner reported that "since last examination spiculæ of bone were frequently discharged, the wound breaking out afresh. He cannot walk any distance without crutch or cane. General health poor." The pensioner was paid December 4, 1881.

FIG. 368.—Excised portion of fibula. *Spec.* 346.

CASE 292.—*Partial excision at the ankle joint.*—Private L. Ettinger,[1] Co. K, 58th New York, aged 52 years, was accidentally injured, near Hunter's Chapel, December 6, 1861, by the blow of an axe, which struck his right foot just below the external malleolus, penetrating the ankle joint. Assistant Surgeon J. S. Billings, U. S. A., who operated in the case, made the following report: "The man was admitted to the Union Hotel Hospital, Georgetown, January 1, 1862, being very feeble and emaciated and complaining of great pain in the foot. A large gaping wound existed at the site of the injury, from which sanious fetid pus was escaping and at the bottom of which dead bone could be felt. Sinuses also ran down each side of the tendo-achillis, and the whole integument about the ankle joint was livid and undermined. On January 6th partial excision of the ankle joint was performed by a curved incision three inches long, made just below the external malleolus and including the original wound. The external malleolus, the whole of the astragalus, and a small portion of the scaphoid were found to be carious and were removed by means of the bone gouge and Liston's forceps. The hæmorrhage was slight. Simple dressings were applied, and ale and good diet were furnished. By March 1st the wound had entirely healed, the skin had resumed its natural appearance, and the patient could walk with a cane. He was then sent to Philadelphia, where he was discharged from service. I saw him eight months afterwards, walking with a cane and with but a very slightly perceptible limp. The age and debilitated condition of this patient rendered the expediency of excision very doubtful; but the result proved entirely satisfactory." The records of South Street Hospital, Philadelphia, show that the patient was discharged September 17, 1862, by reason of "anchylosis of the right ankle joint" resulting from the wound. The man subsequently became a pensioner. The nature of his injury and disability has since then been corroborated by successive certificates of various examining surgeons. The pensioner has been for some years an inmate of the hospital for the insane at Randall's Island, New York Harbor.

TABLE CVI.

Summary of Twenty Cases of Excisions of the Bones of the Extremities.

[Upper Extremities, 1—5; Lower Extremities, 6—20.]

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATE OF INJURY OR DISEASE.	NATURE OF INJURY OR DISEASE.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	Ormsby, M. S., Pt., D, 8th Infantry, age 20.	——— 1862.	Abscess on right shoulder from pressure of knapsack and accoutrements. Another abscess in leg; ulceration.	Aug. 15, 1862.	Portion of acr. proc. of scapula excised; August 22, spine and balance of acr. proc. remov'd. A. Surg. R. Bartholow, U. S. A.	Discharged Nov. 1, 1862. Claim for pension rejected. *Spec.* 415, A. M. M. *See First Surgical Volume*, p. 564.
2	Bliss, O. M., Capt., H, 9th Iowa, age 41.	Oct. 8, 1864.	Compound fracture of the left humerus, caused by fall of horse.	Oct. 9, 1864.	Excision of upper part left humerus thro' a single incision. Surg. A. Goslin, 48th Illinois.	Erysipelas appeared; had nearly passed away on Oct. 31, 1864. Died March 21, 1865.
3	Reynolds, T., Pt., Permanent Party at Carlisle Barracks, Penn., age 27.	May 11, 1863.	Right arm run over by a street car, fracturing humerus.	———	Resection of 2 inches of shaft of right humerus.	Disch'd Mar. 26, 1864. Necrosis; wound re-opened; discharged pus; pensioned; arm impaired.
4	West, W., Pt., F, 78th Ohio, age 39.	Oct. 20, 1863.	Compound comminuted fracture of the right elbow joint. Condyles of humerus, head of radius, and portion of ulna crushed by a car wheel.	Oct. 22, 1863.	Excision of condyles of right humerus, head of radius, and point of olecranon through an incision 5 ins. long. A. A. Surg. J. S. Baily.	Erysipelatous inflammat'n, which appeared on the 8th day, was readily subdued. Died June 20, 1864, of mortification of the arm.
5	Reynaud, C., Pt., H, 2d Kentucky Cavalry, age 26.	May 5, 1864.	Right ulna fractured at upper part by blow from a musket; both ends of bone denuded.	June 4, 1864.	Resection of both ends of bone, about 3 ins. of shaft removed. Surg. R. R. Taylor, U. S. V.	Disch'd June 13, '65: pensioned; anchylosis elbow; good motion of fingers. Died Dec. 28, 1879.
6	Taylor, J., Pt., C, 38th Colored Troops, age 16.	——— 1864.	A log fell upon him, fracturing lower third of right femur; necrosis and sloughing.	Oct. 17, 1864.	Resection of 4 inches of lower third of shaft of right femur. A. A. Surg. O. Shittler.	Wound sloughing. Died October 29, 1864, of exhaustion.
7	Burnett, A. J., Pt., G, 6th East Tennessee, age 36.	Aug. 7, 1863.	Compound comminut'd fracture of left leg and dislocation of ankle; run over by a wagon.	Aug. 21, 1863.	Excision of the left tibia	Discharged June 27, '64: anchylosis of the ankle joint. Claim for a pension rejected.
8	Coburn, S., Pt., G, 3d Illinois Cavalry, age 38.	——— ———	Ulcer of the right leg; periostitis of tibia and inflammation of leg from knee to ankle.	Secondary.	Excision of 3½ inches of the right tibia.	Mustered out July 6, '66; tissues inflamed and indurated; ankle partially stiffened.
9	Disney, T. W., Pt., B, 36th Massachusetts, age 33.	——— ———	Accidental fracture of the right tibia; 3 inches of necrosed bone exposed.	Sept. 2, 1864.	Excision of 5 inches of the right tibia.	Discharged March 8, 1865; pensioned; two inches shortening; lameness. Died Jan. 31, 1873.
10	Harper, H. S., Pt., E, 137th New York, age 35.	Aug. —, 1864.	Scurvy and ulcer of left leg; tibia extensively necrosed.	Jan. 21, 1865.	Excision of 10½ inches of left tibia through an incision 12 inches long. Surg. G. Grant, U. S. V.	Mustered out Sept. 15, 1865; pensioned. 1877, parts still discharging extensively; walks with difficulty; limb nearly worthless.

[1] CULBERTSON (H.), *Excision of the Larger Joints of the Extremities*, in *Transactions American Medical Association*, 1876, Supplement to Vol. XXVII, p. 344. Prize Essay.

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
11	Hickey, T., Corp'l, E, 3d Michigan Cavalry.	Jan. 21, 1864.	Fracture of bones of right leg; kick by a mule; fractured ends overlapped; gangrene.	Mar. 10, 1864.	Fractured ends of tibia remov'd by chain saw. A. A. Surg. S. S. Jessop.	March 19, ligation of post. tibial; metastatic abscess. March 29, amp. thigh. Died Mar. 31, 1864.
12	Hughes, J., Contraband, age 52.	———	Comminuted fracture of the tibia; necrosis about middle.	Mar. 3, 1865.	Excision of about 2 inches of tibia at middle third. A. A. Surg. H. H. Watts.	March 31, 1865; recov'd. Walking on injured leg.
13	Mickey, B. F., Unassigned recruit, age 25.	April 6, 1865.	Comp'd comminut'd fracture of the lower third of left tibia and fibula, caused by leaping from railroad car while in motion.	April 20, 1865.	Excision of 2 inches of left tibia through incision 3 inches long. Surgeon T. W. Fry, U. S. V.	Absented himself without leave. Not pensioned.
14	Moulton, A. S., Pt., A, 6th New Hampshire.	———	Disease of left leg, caused by fever; necrosis of tibia.	July 31, 1862.	Excision of a portion of tibia.	Discharged Sept. 27, 1862; pensioned. 1871, leg swollen and painful; varicose veins.
15	Olds, J. K., Serg't, B, 10th New York Artillery, age 29.	May 29, 1864.	Compound fracture of middle third of right tibia and fibula; fibula firmly united; no attempt at union in tibia.	Feb. 7, 1865.	Ends of tibia remo'd with chain saw; holes drilled to facilitate formation of callus. Surg. O. A. Judson, U. S. V.	Discharged June 14, 1865; tibia ununited; limb totally useless. May, 1877, amputation of leg below the knee.
16	Peaseley, C., Pt., A, 10th Massachusetts.	Aug. 31, 1861.	Comminuted fracture of the left tibia and fibula by kick of a horse; no attempt at union; bone bare for space of 2 inches.	Secondary.	Excision of 2 inches of shafts of tibia and fibula through anterior and posterior incisions.	Discharged Dec. 16, 1861; pens'd. 1877, no flexion or motion at ankle; wound breaking out afresh. *Spec.* 346, A. M. M.
17	White, H. C., Pt., C, 40th New York, age 23.	———	Necrosis of the right tibia, caused by syphilis.	Secondary.	Excision of 6 inches of the right tibia, middle third.	Discharged Oct. 3, 1865. 1869, ulcerated surface of limb with indurated and adherent border.
18	[1]Ettinger, L., Pt., K, 58th New York, age 52.	Dec. 6, 1861.	Right foot struck with an axe just below malleolus, penetrating ankle joint; large gaping wound, at the bottom of which dead bone could be felt.	Jan. 6, 1862.	Curved incision 3 inches long just below external malleolus; malleolus, astragalus, and a small portion of scaphoid bone removed by bone gouge and Liston's forceps. Ass't Surg. J. S. Billings, U. S. A.	March 1, entirely healed. Discharged September 17, 1862; anchylosis of ankle joint; pensioned. February, 1881, has been for the past eight years an inmate of Hospital for the Insane at Randall's Island.
19	Danbury, E., Pt., K, 14th New Jersey, age 22.	Oct. 3, 1863.	Comminuted fracture of the right os calcis by a railroad accident.	Oct. 10, 1863.	Excision of entire os calcis. Surg. A. Treganowan, 14th New Jersey.	Wound healed but opened again during march in Wilderness. Transferred for muster out May 23, 1865; not a pensioner.
20	Pettie, H., Pt., K, 76th New York, age 22.	May —, 1863.	Ulcer, causing caries	July 26, 1863.	Excision of the first metatarsal bone of right foot. Assistant Surg. W. Thomson, U. S. A.	Discharged Dec. 19, 1863; pens'd. 1877, foot partly everted, toe retracted, foot weakened.

AMPUTATIONS.—Seven hundred and seventy-six cases of amputations in the bones of the extremities are found on the records. One hundred and ninety-five were in the upper, and five hundred and eighty-one in the lower extremities. Of the former twenty, or 10.5 per cent., and of the latter one hundred and forty-six, or 25.5 per cent., were fatal.

AMPUTATIONS IN THE UPPER EXTREMITIES.—Six were amputations at the shoulder joint, forty-four in the arm, thirty-four in the forearm, seventeen of the hand, and ninety-four of the fingers; in one of the latter re-amputation in the forearm became necessary:

Table CVII.

Numerical Statement of One Hundred and Ninety-five Cases of Amputations in the Upper Extremities for Disease or for Injury not inflicted by Weapons of War.

Amputations.	Cases.					For Injury.			For Disease.	
	Total.	Recovery.	Fatal.	Undetermin'd Results.	Percentage Fatality.	Recovery.	Fatal.	Undetermin'd Results.	Recovery.	Fatal.

CASE 993.—*Amputation in the arm.*—A. J. Ross, a civilian, was hurt in the left forearm by a railroad accident at Mound City, April 18, 1863. The injury and its results were described by Surgeon H. Wardner, U. S. V., as follows: "The radius and ulna were fractured in several places and the superficial muscles of the palmar side of the arm were terrible lacerated, besides which the arm was bruised about the elbow joint. The patient was considerably prostrated from loss of blood, so much so as to cause me to desist from operating when counseled by his attending physicians. Adhesive strips and cold-water dressings were used and the patient was put upon stimulants and tonics. By May 1st much of the superficial muscular substance of the forearm had sloughed away and the olecranon process was exposed and denuded. Flaxseed poultices with charcoal and cinchona were now applied. On June 3d I again visited the patient and urged him to have the limb amputated. The treatment was continued until June 18th, when it was found that the bones would not unite and the patient was on the decline, and I was called by the attending physician for the purpose of operating. I found the patient quite weak and showing symptoms of epilepsy. I performed the amputation at the middle third of the humerus by circular operation and dressed the stump with simple dressings, which were continued until June 24th, when a portion of the ligatures came away. Two days afterwards the patient was able to walk about the room, and the next day the remaining ligatures came away. On July 4th the patient was attacked with fever and diarrhœa, which continued over two weeks, reducing him very low and seriously retarding the progress of the case. By July 25th, however, he was regaining his strength rapidly and the stump was again improving. In the following month he was able to walk about town and was gaining flesh very fast. On October 13th he was considered cured." The amputated portion of the humerus and the bones of the forearm (*Spec.* 1770) were contributed to the Museum by the operator and are represented in the cut (FIG. 369). The specimen shows the bones of the forearm to be fractured near the middle and again at their upper extremities, the greater portion of the shafts being necrosed and having slight and imperfect involucra. The fragments of the lower extremity of the humerus are attached to it in irregular positions by callus.

FIG. 369.—Bones of the forearm, with portion of humerus. *Spec.* 1770.

CASE 994.—*Amputation in the forearm.*—Private N. W. Pelton, 2d Wisconsin Cavalry, aged 46 years, was admitted to Harvey Hospital at Madison on November 15, 1864, with disease of the right hand, for which amputation was performed by Surgeon H. Culbertson, U. S. V., who reported the following history: "The patient had lost the thumb and index finger of his right hand, which were removed by Dr. R. L. Tolfore, of Lone Rock, Wisconsin, on April 20, 1864, the operation being the result of a felon contracted the previous month. On December 30th, when the forearm was amputated, the wrist joint had become partially anchylosed from ostitis and necrosis of several of the carpal bones, and there was an open sinus on the dorsum of the hand; plastic organized material in the cellular tissues of the fingers, hand, wrist, and along the extensor and flexor tendons; cellular tissues indurated and of a yellow color; periostitis extending up the radius and ulna three inches above the wrist joint; structure of ulna somewhat softened and darkened for two inches above its lower extremity; loss of motion in the remaining fingers induced by the organized effusion about the tendons. The patient's system had become impaired from continued pain and discharge. He had recently had an attack of erysipelas in the hand and arm, but had entirely recovered and earnestly desired to have the hand removed. The amputation was performed by the circular method at the lower fourth of the forearm, above the diseased bone, three vessels, the radial, ulnar, and interosseous arteries, being taken up. Chloroform was used with good effect. One grain of morphia was given after the operation, and the wound was closed with sutures, adhesive plaster, and bandage. Fifteen hours afterwards the bandage was removed and cold-water dressings were applied. The patient died January 7, 1865, of erysipelas, which extended to other parts of the body and was arrested in the arm and stump." The bones of the amputated limb, comprising the lower portion of the forearm, the carpus, and three metacarpal bones, were contributed to the Museum by the operator and constitute specimen 3695 of the *Surgical Section*. The carpus shows the semilunar bone to be partly necrosed and caries exists in the adjacent bones.

CASE 995.—*Amputation in the forearm.*—Private F. Schubnel, Co. A, 23d Indiana, aged 37 years, had his right hand poisoned in May, 1864, while engaged in pulling and gathering leaves for bedding for a field hospital during the Atlanta campaign. Surgeon M. Brucker of the regiment certified to the injury, and reported that it produced malignant ulceration, affecting the whole arm. At the expiration of his service, July 28, 1864, the man was mustered out and returned to his home, where amputation subsequently became necessary and was performed four inches below the elbow on September 2, 1864. Dr. D. H. Combs, of Charlestown, Indiana, who performed the operation, certified that when the man came to him "he was suffering from poison which had affected his system. Gangrene had ensued, the arm was greatly swollen, and there was no remedy but amputation, which was performed. After a time the stump healed well and the patient was in a fair way to recovery, though his system was weakened from the effects of the poison; his gums were spongy, tongue flabby," etc. The operator further added that he saw but little of the patient after the stump had entirely healed. In his application for commutation, dated 1870, the pensioner described the stump as being in a "sound condition." No definite cause of his death, which occurred on April 5, 1873, has been reported to the Pension Office.

Ninety-three of the one hundred and ninety-five amputations in the upper extremities were ablations of fingers. In the following tabular statement are given condensed accounts of the remaining one hundred and two cases of amputations at the shoulder, in the arm, in the forearm, and in the hand; sixty-seven were for fractures caused by falls, railroad accidents, etc., six for punctured and incised wounds, eight for burns or scalds, four for poisoning, and seventeen for diseases.

TABLE CVIII.

Summary of One Hundred and Two Cases of Amputations in the Upper Extremities for Miscellaneous Injuries or Disease.

[Amputations at the shoulder, 1—6; amputations in the arm, 7—50; amputations in the forearm, 51—85; amputations in the hand, 86—102.]

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	Armes, A., Pt., D, 93d New York, age 22.	Sept. 20, 1864.	Right arm crushed by railroad cars.	Sept. 20, 1864.	Amputation at the shoulder joint; flaps from deltoid muscle and axilla. A. A. Surg. M. Baldwin.	Discharged February 17, 1865; pensioned; good stump.
2	Corragin, J., Pt., 13th Michigan Battery, age 23.	June 19, 1865.	Right arm carried away by railroad cars.	June 20, 1865.	Amputat'n at the shoulder joint by external and internal flaps. A. A. Surg. F. P. Foster.	Discharged September 19, 1865; pensioned.
3	Wunderlich, M., Pt., H, 1st Michigan Artillery, age 20.	June 30, 1865.	Comminuted fracture of right arm, caused by a railroad accident.	June 30, 1865.	Antero-posterior flap amputation at shoulder joint. A. A. Surg. M. L. Herr.	Discharged October 27, 1865; not a pensioner.
4	Bowers, G. W., Pt., A, 3d Maryland, age 25.	Oct. 4, 1863.	Right forearm and arm crushed by railroad cars.	Oct. 4, 1863.	Flap amputation at shoulder joint by Lisfranc's process. A. A. Surg. J. Kirker.	Died October 9, 1863, of pyæmia.
5	Hill, I. B. (Rev.), U. S. Sanitary Commission, age 68.	June 15, 1864.	Left arm crushed by railroad cars.	June 15, 1864.	Amputation at the shoulder joint. Ass't Surg. C. C. Byrne, U. S. A.	Died June 16, 1864, of shock.
6	Whalen, M., Corp'l, G, 32d Massachusetts, age 38.	Sept. 15, 1864.	Right arm severed and scapula fractured by railroad cars.	Sept. 15, 1864.	Amputat'n at the shoulder joint and removal of fragments and head of scapula. Ass't Surg. C. Bacon, jr., U. S. A.	Died September 16, 1864, of injuries. Autopsy revealed also fracture of first, second, and third ribs, etc.
7	Baker, J., Serg't, A, 48th Pennsylvania.	Feb. 3, 1864.	Comp'nd comminuted fracture of left arm and laceration middle finger, right hand; railroad accident.	Feb. 3, 1864.	Circular amputat'n of arm near shoulder joint. A. A. Surg. A. H. Halberstadt.	Transferred to Veteran Reserve Corps March 3, 1865.
8	Carpenter, J. N., Pt., A, 11th Michigan.	Sept. 24, 1864.	Railroad injury of right arm...	Sept. 24, 1864.	Circular amputation of arm 4 inches from fold of pectoralis major.	Discharged September 30, 1864.
9	Carrigan, F. S., Pt., F, 5th Cavalry.	Nov. 21, 1865.	Right forearm crushed by being run over by a locomotive.	Nov. 21, 1865.	Circular amputation of right arm at lower third. Ass't Surg. D. Bache, U. S. A.	Discharged March 2, 1866; rejected as a pensioner.
10	Coleman, J., Pt., D, 6th Tennessee Mounted Infantry, age 18.	Mar. —, 1865.	Incised wound of left elbow joint; gangrene.	April 9, 1865.	Circular amputation at middle third of left arm. A. A. Surg. J. W. Taylor.	Discharged June 6, 1865.
11	Dilley, A., Gov't employé, Nashville and Chattanooga Railroad, age 20.	June 12, 1863.	While attempting to get on a moving train had both arms crushed by car wheels; left humerus crushed to its head.	Prim'ry.	Amputation of left arm, 3 ins. of bone allowed to remain in stump; also of right forearm at middle third. Dr. Brandish, Nashville.	Recovery. Wound of left shoulder has never healed. May 20, 1866, three sinuses in front and one behind shoulder leading to necrosed bone. Oct., 1866, his health is very good.
12	Downey, J., Pt., D, 145th New York, age 40.	Oct. 28, 1863.	Comminuted fract. of forearm and arm, great laceration of soft parts; railroad accident.	Oct. 29, 1863.	Flap amputation at upper third of left arm. Surg. R. S. Kenderdine, U. S. V., and A. A. Surg. D. W. Hunt.	Much sloughing. Disch'd Nov. 3, 1864; stump healed.
13	Feigley, J. C., Serg't Maj. 31st Ohio, age 25.	Feb. 24, 1864.	Compound fracture of left arm; railroad accident.	Feb. 24, 1864.	Amputat'n of left arm at upper third. Pension Exam. Surg. Hamlin, Newark, Ohio.	Discharged June 1, 1864.
14	Freeman, H., Pt., D, 60th Illinois, age 21.	———	Unfavorable result of vaccination in rebel prison; gangrenous.	Sept. 28, 1864.	Circular amputation of left arm near shoulder joint. Confederate surgeon.	Mustered out July 31, 1865.
15	Fuller, A., Serg't, G, 14th Maine, age 24.	June 30, 1864.	Left arm crushed by railroad cars.	June 30, 1864.	Arm amputated 5 inches from shoulder. Surg. T. F. Perley, U. S. V.	Discharged September 11, 1865; stump healed.
16	Funking, H., Pt., D, 5th N. Y. H'vy Artillery, age 23.	Oct. 25, 1864.	Comminuted fracture of right arm and left foot; railroad accident.	Oct. 25, 1864.	Circular amputation at middle third of right arm and at lower third of left leg. Surg. Z. E. Bliss, U. S. V.	Doing well. Discharged May 31, 1865.
17	Loveridge, J., Pt., G, 14th N. Y. Heavy Artillery.	Dec. 18, 1862.	Injury of the right arm by railroad cars.	Dec. 18, 1862.	Flap amputation of right arm, upper third. Surg. S. Morse, 14th N. Y. Heavy Artillery.	Discharged May 19, 1864.
18	Lowry, P., Pt., C, 21st New York Cavalry, age 27.	June 14, 1865.	Comminuted fracture of right humerus, radius, and ulna, also of second and third toes of right foot.	June 15, 1865.	Flap amputation of right arm, upper third, also of second and third toes. A. A. Surg. H. S. Streeter.	Discharged November 22, 1865.
19	Marcy, G. F., Pt., F, 21st Massachusetts.	Aug. 29, 1861.	Left arm injured above elbow; railroad accident.	Aug. 30, 1861.	Amputation of arm at upper third.	Discharged January 13, 1862; stump good.
20	*Meeks, J. C.*, Serg't., A, 24th Georgia, age 22.	July 16, 1864.	Comminuted fracture of right elbow joint.	July 19, 1864.	Circular amputation at middle third of right arm.	Sent to prison February 16, 1865.
21	Megans, T., Hospital Steward, 90th Penn., age 41.	July 4, 1864.	Railroad cars completely crushed and comminuted right humerus in lower third.	July 4, 1864.	Circular amputation of right arm at upper third. A. A. Surg. E. L. Duer.	Gangrene. July 10, secondary hæmorrhage. Discharged December 12, 1864.
22	Mitchell, E., Pt., E, 6th Indiana Cavalry, age 28.	Oct. 30, 1864.	Right arm crushed and almost severed; railroad accident.	Oct. 30, 1864.	Circular amputation at upper third of arm. Ass't Surg. W. H. Jones, 115th Ohio.	Transferred December 1, 1864; not a pensioner.
23	Murphy, B., Pt., H, 1st Rhode Island Arti'ry, age 46.	May 14, 1863.	Fell from caisson and sustained compound comminuted fracture of left arm.	May 14, 1863.	Flap amputation of arm at upper third.	Discharged September 17, 1863; stump healed but tender.
24	Navins, J., citizen	July 23, 1863.	Compound fracture of right radius and ulna and simple fracture of humerus; fall from a bridge; sphacelus.	July 26, 1863.	Oval skin-flap amputation of right arm at surgical neck of humerus, with circular section of muscles. Ass't Surg. W. Thomson, U. S. A.	Discharged from hospital Nov. 15, 1863, perfectly well. *Spec.* 1849, A. M. M.
25	Neer, M., Pt., H, 14th West Virginia, age 29.	April 14, 1864.	Left forearm crushed from wrist to elbow, also fracture of inferior maxilla; railroad accident.	April 14, 1864.	Antero-posterior flap amputation at lower third of arm. Surg. S. N. Sherman, U. S. V.	Hæmorrhage on 17th day; no recurrence. Discharged September 10, 1864; not pensioned.
26	Newcomb, N. L., Pt., G, 174th Ohio.	May 12, 1865.	Right arm injured above the elbow; railroad accident.	May 13, 1865.	Circular amputation at lower third of arm. Surg. G. W. Kizer, C. S. A.	Discharged June 28, 1865; stump sound.

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
27	Osborne, C., Pt., 28th New York Battery.	Feb. 24, 1865.	Compound comminuted fracture of right humerus; railroad accident.	Feb. 24, 1865.	Flap amputation of arm 9 ins. from shoulder.	Discharged June 14, 1865.
28	Rieman, H., Pt., G, 12th Maine, age 23.	Jan. 16, 1864.	Injury of left arm; railroad accident.	Jan. 16, 1864.	Flap amputat'n at middle third of arm. Surg. O. M. Humphreys, U. S. V.	Jan. 31, ligation of axillary. Feb. 17, ligation of subclavian. Gangrene; necrosis. Disch'd July 31, 1865.
29	Romine, J., Pt., F, 122d Ohio, age 20.	Sept. 14, 1864.	Right arm crushed under car wheel.	Nov. 4, 1864.	Flap amputation of arm near insertion of deltoid. Surg. T. A. Dargan, P. A. C. S.	Discharged June 20, 1865; good stump.
30	Ross, A. J., civilian.....	April 18, 1863.	Fracture of left radius and ulna, involving elbow joint; railroad accident.	June 18, 1863.	Circular amputation at middle third of arm. Surg. H. Wardner, U. S. V.	October 18, 1863, cured. *Spec.* 1770, A. M. M.
31	Seary, J., Pt., H, 1st Missouri Cavalry, age 26.	May 26, 1864.	Fracture of left arm by being thrown from his horse.	May 26, 1864.	Flap amputation at upper third of left arm.	Discharged July 31, 1864. Died July 15, 1868.
32	Secor, D., Corp'l, A, 56th New York, age 32.	July 12, 1865.	Comp'nd comminuted fracture of left arm; railroad accident.	July 12, 1865.	Circular amputation of left arm at lower third.	Discharged November 4, 1865.
33	Seit, F., Pt., F, 68th New York.	Sept. 15, 1864.	Right arm crushed by railroad accident.	Sept. 15, 1864.	Amputation of right arm about 3 ins. from shoulder. Surg. L. Schultz, 68th N. Y.	Discharged June 17, 1865; sound stump.
34	Sumner, L. G., Pt., D, 78th New York.	July 10, 1862.	Injury of right arm; railroad accident.	Twelve hours after.	Amputation of arm 3 inches from shoulder. Surg. E. P. Gray, 78th N. Y.	Discharged January 17, 1863; sound stump.
35	Thompson, M., Pt., C, 1st Penn. Light Art., age 30.	Jan. 22, 1865.	Railroad injury of left arm....	——— 1865.	Amputat'n of arm below shoulder joint.	Deserted July 2, 1865; no pension record.
36	Tucker, W. J., Pt., G, 11th Veteran Reserve Corps.	July 15, 1864.	Injury of right arm above elbow and dislocation of thigh; railroad accident.	July 16, 1864.	Flap amputat'n at middle third of right arm.	Discharged Nov. 2, 1864; stump healed.
37	Tuttle, J. H., Pt., E, 38th Massachusetts	Mar. 28, 1865.	Injury of left arm by railroad accident.	Mar. 28, 1865.	Flap amputation of left arm 9 inches from shoulder. Surg. H. Fearn, 175th N. Y.	Stump wasted and weak, but healed. Disch'd June 30, 1865.
38	Van Vleck, W., Pt., H, 125th New York, age 37.	Oct. 19, 1862.	Injury of right arm and right knee; railroad accident.	Oct. 19, 1862.	Flap amputation at upper third of arm. Surg. W. S. Cooper, 125th N. Y.	Discharged November 21, 1862. Died July 28, 1868, of pyæmia.
39	Wade, S., Pt., E, 177th Ohio, age 21.	Oct. 13, 1864.	Compound fracture at middle third of left humerus; railroad accident.	Oct. 13, 1864.	Circular amputation at upper third of arm. A. A. Surg. S. L. Merrill.	Discharged April 13, 1865; stump healed.
40	Wait, H. L., Pt., C, 3d Iowa, age 25.	May 9, 1864.	Right elbow joint crushed by railroad car wheel.	May 9, 1864.	Flap amputation 2 inches above elbow.	Mustered out August 26, 1865.
41	Clark, J., employé in the Quartermaster's Departm't, age 30.	Jan. 4, 1865.	Compound comminuted fracture of left humerus, radius, and ulna; railroad accident.	Jan. 4, 1865.	Amputation of arm by antero-post. semi-circular flaps. A. A. Surg. W. Balser.	January 22, pyæmic symptoms set in. Died February 11, 1865, of pyæmia.
42	Coker, J., Pt., C, 6th Tennessee, age 34.	Jan. 26, 1865.	Comp'nd comminuted fracture at upper third of left radius and ulna, also fracture and dislocation of right elbow.	Jan. 27, 1865.	Flap amputation of both arms at middle third. A. A. Surg. H. S. Streeter.	In a semi-moribund condition. Died January 27, 1865.
43						
44	Conway, J. A., Pt., A, 55th Pennsylvania, age 22.	May 24, 1865.	Railroad cars completely crushed left radius and ulna and right tibia and fibula.	May 24, 1865.	Circular amputat'n, lower third, left arm. A. A. Surg. R. M. Kirk. Amp. of right thigh.	Died May 28, 1865, of internal injuries.
45	Dougherty, J., Pt., A, 90th Pennsylvania.	Nov. 11, 1863.	Compound fracture left radius and ulna, laceration of scalp and cone. of brain, fracture of 2d and 3d ribs; gangrene.	Nov. 15, 1863.	Antero-posterior flap amputation at middle third of arm. A. A. Surg. S. C. King.	Died November 18, 1863, of injuries; autopsy.
46	Enyart, H. D., Pt., G, 23d Veteran Reserve Corps, age 28.	Oct. 13, 1864.	Compound fracture of right radius and ulna; accident; gangrene.	Oct. 24, 1864.	Amputation at upper third of right arm. Surg. A. Hammer, U. S. V.	Died November 11, 1864, of pyæmia; autopsy.
47	Hitchens, C., Pt., C, 2d Maryland P. H. B.	April 3, 1863.	Right arm crushed from wrist to middle of humerus; railroad accident.	April 3, 1863.	Amputation of arm near shoulder joint.	No reaction. Died April 5, 1863.
48	Ready, P., Pt., E, 13th New York Cavalry, age 48.	June 9, 1864.	Compound comminuted fracture of middle and up. thirds of right radius and ulna, joint destroyed; railroad accident.	June 9, 1864.	Flap amputat'n at middle third of arm. Ass't Surg. J. H. Frantz, U. S. A.	June 13, pyæm. symptoms. Died June 29, 1864, of pyæmia; autopsy.
49	Rouse, M., colored woman, age 23.	———	Ulcer of left arm and neck resulting from frequent attacks of malarial fever; gangrene.	April 15, 1865.	Circular amputation at upper third of arm. Surgeon T. J. Wright, 64th U. S. C. T.	Died April 27, 1865, of diarrhœa.
50	Sweeny, J., Pt., E, 70th N. York.	Mar. 28, 1864.	Comp'nd comminuted fracture of right humerus, lower third, extensive laceration of forearm; also compound fracture of left metatarsus and phalanges; railroad accident.	Mar. 29, 1864.	Circular amputation of right arm. A. A. Surg. W. S. Ward.	Rallied to some extent. Died March 31, 1864, from nervous shock.
51	Adams, T. B., Pt., A, 6th Kansas Cavalry, age 39.	———	Scrofula; inflamma'n involving ligaments, carpal bones, and low. thirds of radius and ulna.	———	Amputation of right forearm ..	Discharged August 12, 1863.
52	Campbell, S., Pt., H, 2d Maryland, age 22.	———	Palmar abscess of left hand; erysipelas.	Feb 19, 1863.	Antero-posterior flap amputation at middle third of forearm.	Feb. 23, sec. hæm., lig. of radial artery. Trans. to V. R. Corps July 16, 1863; stump perfectly healed. *Specs.* 1184, 1185, A. M. M.
53	Dilley, A., Gov't employé, Nashville and Chattenooga Railroad, age 20.	June 12, 1863.	Both arms crushed by car wheels; attempting to get on moving train.	Prim'ry.	Amputation of right forearm, middle third, and of left arm, upper third. Dr. Brandish, Nashville.	Recovered. May 20, 1866, three sinuses in front and one behind shoulder leading to necro. bone. Oct., 1866, health very good.
54	Dunlap, O., Capt., I, 26th Illinois.	Dec. 28, 1864.	Injury of right hand and right foot; railroad accident.	Dec. 28, 1864.	Amputation forearm just above wrist and of leg just above ankle. Surg. O. Hoyt, 30th Wisconsin.	Discharged May 15, 1865.
55	Fleming, J., Corp'l, F, Cole's Maryland Cavalry.	June 20, 1864.	Left hand mangled and forearm fractured, also thumb and first finger right hand; railroad accident.	June 21, 1864.	Circular flap amputat'n at lower third of left forearm and thumb and finger right hand.	Discharged March 11, 1865.
56	Fosgate, O., Pt., C, 57th Massachusetts, age 43.	———	Felon on right index finger; fissures of hand sloughing; hæmorrh. from palmar arch.	June 16, 1864.	Circular amputation at lower third of forearm. A. A. Surg. M. M. Jarratt.	Transferred to Veteran Reserve Corps January 18, 1865; sound stump.
57	Gardner, C. A., Pt., B, 10th New York Artillery.	Mar. —, 1864.	Fever sore	Aug. 28, 1864.	Flap amputation at lower third of left forearm. Dr. Trowbridge, Watertown, N. Y.	Transferred to Veteran Reserve Corps.

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
58	Gardner, M., Pt., I, 12th Colored Troops.	Aug. 26, 1864.	Injury of right hand and foot by railroad cars.	Aug. 27, 1864.	Amput'n of forearm and leg at lower thirds. Surg. G. Stegman, 12th Colored Troops.	Discharged July 18, 1865.
59) 60)	Garrett, E., Pt., A, 43d Colored Troops, age 20.	———	Both limbs injured by falling into fire.	———	Circular amputation at middle third of both forearms.	Discharged August 22, 1865.
61	Glavin, J., Pt., G, 21st New York Cavalry.	Jan. 18, 1865.	Right hand burned, destroying bone and muscles.	Jan. 18, 1865.	Amputation at middle third of forearm. Acting Staff Surg. N. F. Graham.	Discharged March 8, 1866.
62	Graeser, W., Pt., I, 42d New York.	——— 1864.	Left hand poisoned while a prisoner of war.	Feb. —, 1865.	Amputation below elbow joint.	Discharged Aug. 16, 1865; good stump; died since.
63	Gridley, J., Pt., —, 9th Michigan, age 30.	Sept. 16, 1864.	Contusion of left forearm by cars.	Sept. 17, 1864.	Flap amputat'n at middle third of forearm.	Discharged February 4, 1865.
64	Halbert, J. S., Pt., I, 8th Illinois Cavalry.	June 24, 1865.	Injury of left forearm; railroad accident.	June 24, 1865.	Amputation 2 inches below elbow joint.	Discharged; stump painful.
65	Hawkins, S., Pt., A, 9th New York Cavalry, age 35.	Jan. 20, 1865.	Axe wound in left wrist joint..	Jan. 20, 1865.	Circular flap amput'n at lower third of forearm. Surg. R. Curran, 9th N. Y. Cavalry.	Discharged.
66	Hughes, T., Pt., H, 49th N. York, age 44.	Aug. 30, 1864.	Comp'nd comminuted fracture of right radius and ulna; railroad accident.	Aug. 30, 1864.	Circular amputation at upper third of forearm. Ass't Surg. P. C. Davis, U. S. A.	Transferred to Veteran Reserve Corps November 27, 1864.
67	Jones, N., Pt., D, 4th Engineers, Colored Troops.	———	Cut by an axe across forearm and face.	———	Double flap amputation at middle third of forearm.	Discharged March 10, 1864; excellent stump.
68	Kennedy, P. A. B., Pt., B, 36th Indiana.	April —, 1863.	Scrofula. Right wrist joint, knee, and ankle affected by tuberculosis; exten. destruction of bony and soft parts.	Aug. 16, 1864.	Circular amp. 5 inches below elbow. Dr. J. M. Youal, Indianapolis. (Feb. 25, 1864, amp. right thigh, low. third.)	Mustered out September 21, 1864.
69	Killgore, J. A., Pt., B, 97th Illinois, age 19.	Nov. 1, 1863.	Lower two-thirds of right forearm badly crushed; railroad accident; also scalp wound.	Nov. 1, 1863.	Circular amputation at upper third of forearm. Ass't Surg. S. H. Orton, U. S. A.	Rapid recovery; discharged December 9, 1863.
70	Laviers, M. H., Pt., F, 26th Michigan, age 30.	———	Injured by a thrashing machine previous to enlistment.	———	Amputation at middle third of left forearm.	Discharged October 29, 1864.
71	Moreland, J., Pt., G, 9th Ohio Cavalry.	Mar. 14, 1865.	Fracture of the right hand: accident; mollities of carpal bones.	Aug. 15, 1865.	Amputat'n between elbow and wrist. Dr. J. Tingle, Cambridge, Ohio.	Discharged April 21, 1865.
72	Osborne, W. L., Pt., H, 12th West Virginia.	———	Cancer of left forearm.....	——— 1864.	Amputation forearm at upper third.	Discharged April 20, 1864.
73	Pampell, J. E., Serg't, B, 3d Maryland, age 23.	Nov. 9, 1863.	Comp'nd comminuted fracture left forearm and right middle finger; railroad accident.	Nov. 9, 1863.	Circular amputation at middle third of forearm. Surg. R. R. Clark, 34th Mass. Amputat'n right middle finger and portion metacarpal bone.	Healed kindly; discharged April 11, 1864.
74	Payne, W. T., Serg't, M, 6th Kentucky Cavalry, age 22.	May 3, 1864.	Right hand and wrist crushed by railroad cars.	May 3, 1864.	Flap amputat'n at middle third of forearm.	Flaps united by first intention; discharged September 15, 1864.
75	Price, H., Pt., H, 66th New York.	Feb. 6, 1863.	Fell into fire and burned right forearm from elbow to fingers; gangrene.	Feb. 27, 1863.	Flap amputation about middle of forearm.	Discharged April 14, 1863; excellent stump.
76	Roller, J., Bugler, 13th New York Battery.	July 13, 1865.	Right hand crushed; railroad accident.	July 13, 1865.	Antero-posterior flap amputat'n at lower third of forearm.	Discharged August 4, 1865.
77	Schubnel, F., Pt., A, 23d Indiana.	May 14, 1864.	Right hand poisoned by weeds; malignant ulceration, threatening mortification.	Sept. 2, 1864.	Amputation at upper third of forearm. Dr. D. H. Combs, Charlestown, Ind.	Discharged July 28, 1864.
78	Woodfolk, H., Pt., B, 28th Colored Troops, age 22.	Sept. 1, 1864.	Right hand injured by falling into fire.	———	Flap amputation at upper third of forearm.	Discharged December 30, 1865.
79	Aylmer, E. P., Lieut., 1st Wisconsin Battery.	June 25, 1864.	Comminution of right forearm; run over by a horse-car.	June 27, 1864.	Flap amputation at lower third of forearm. A. A. Surg. J. C. Lee.	Died July 13, 1864, of pneumonia.
80	Ball, T. E., Pt., 9th Indiana Battery, age 40.	Jan. 27, 1865.	Burn and scald of left forearm; explosion of Steamer Eclipse.	Feb. 15, 1865.	Circular amputation at upper third of forearm. Surg. W. Varian, U. S. V.	Sloughing; secondary hæmorrh. Died March 24, 1865, of exhaustion and pyæmia.
81	Hede, C., Corp'l, E, 32d Indiana, age 28.	June 21, 1864.	Right radius comminuted at lower third by car wheel.	July 15, 1864.	Circular amput'n at the upper third of forearm. A. A. Surg. E. Kramer.	Died July 29, 1864, of chronic diarrhœa.
82	Norton, M., employé Quartermaster's Department, age 20.	Mar. 26, 1864.	Compound frac. lower third of left radius and ulna; caught in an engine; skin and muscles torn from hand and forearm.	Mar. 26, 1864.	Circular amputat'n of forearm.	Mar. 29, erysipelas. April 2, hæm. from radial art.; lig. at middle third of brachial. Died April 4, 1864, of hæmorrhage.
83	Pelton, N. F., Serg't, 2d Wisconsin Cavalry, age 46.	Mar. —, 1864.	Felon of thumb and index finger of right hand. April 20, thumb and index finger removed; ostitis and necrosis of carpal bones; erysipelas.	Dec. 30, 1864.	Circular amputation at lower third forearm; radial, ulnar, and interosseous arteries tied Surg. H. Culbertson, U. S. V.	Died January 7, 1865, of erysipelas. *Spec.* 3095, A. M. M.
84	Shields, J., Pt., G, 83d Pennsylvania.	——— 1864.	Extensive burn of right forearm; extensive slough'g and suppuration.	Oct. 31, 1864.	Circular amputation 2 inches below elbow. Ass't Surg. H. Allen, U. S. A.	Typhoid pneumonia and diarrh. Died November 4, 1864, of exhaustion; autopsy.
85	Tomlison, J., Pt., A, 120th Indiana, age 42.	Dec. 5, 1864.	Erysipelas of right hand followed by gangrene; sloughing.	Jan. 21, 1865.	Circular amputation at upper third of forearm. Ass't Surg. B. Knickerbocker, U. S. A.	March 3, gang. in stump. Died May 23, '65, of acute dysentery.
86	Davidson, S. H., Pt., 2d Iowa Battery, age 19.	Mar. 22, 1864.	Bowie knife dividing right ulnar artery and opening ulnacarpal articulation. Mar. 22, 1864, ligation of ulnar artery; dry gangrene.	April 12, 1864.	Amputation of fourth finger with head of metacarpal bone. Surg. J. G. Keenon, U. S. V.	Returned to duty June 8, 1864. *See Second Surgical Volume*, p. 436.
87	Denmark, J. H., Pt., H, 14th New York H'vy Artillery, age 19.	Jan. 12, 1865.	Punctured wound of right hand.	Feb. 20, 1865.	Amputation of little finger and head of metacarpal bone; antero-posterior flaps.	Furloughed Mar. 25 1865; nearly healed.
88	Dickey, C. B., Pt., C, 104th Ohio, age 22.	July —, 1864.	Right hand injured by railroad accident; little finger cut off, third and fourth fing'rs broken.	July 12, 1864.	All the bone of little finger and its metacarpal bone removed.	Recovered.
89	Doan, C., Pt., C, 3d Penn. Res. Corps, age 30.	April 3, 1864.	Railroad car passing over left hand and crushing it.	April 5, 1864.	Amputat'n of fingers, left hand, through the metacarpus.	Discharged ——— 1865.
90	Doyle, J. B., Pt., K, 18th Iowa.	Nov. 23, 1864.	Bitten in the middle of third left finger by a comrade; bone denuded and exposed.	Dec. 7, 1864.	Oval amputation of finger and head of metacarpal bone. Surg. C. E. Swasey, U. S. V.	Recovery.
91	Ellison, D., colored seaman, U.S. Steam'r Gen. Thomas, age 16.	Nov. 11, 1864.	Metacarpal bone of mid. finger crushed by machinery.	Nov. 21, 1864.	Amputation of middle finger and metacarpal bone. Ass't Surg. H. T. Legler, U. S. V.	Recovery.

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
92	Harris, A. W., Corp'l, D, 5th Kentucky.	Mar. 10, 1864.	Gangrene of index finger, right hand.	April 13, 1864.	Amputat'n of index finger with head of metacarpal bone. Confederate surgeon.	Returned to duty Aug. 25, 1864.
93	Keeler, J., Pt., 105th Co. 2d Veteran Reserve Corps, age 32.	———	Gangrenous sloughing of left second finger.	Sept. 18, 1864.	Amputation left second finger with head of metacarpal bone. A. A. Surg. J. W. Hall.	Discharged April 28, 1865.
94	Loveland, A. A., Pt., H, 1st Conn. Cavalry, age 21.	———	Tumor first finger of left hand, supposed to be fungus hæmatodes.	Mar. 26, 1864.	Amputat'n of finger with head of metacarpal bone. A. A. Surg. J. Neff.	Recovery.
95	Luecke, A., Pt., G, 11th Infantry.	June 10, 1862.	Axe wound of left index finger; anchylosis and deformity.	June 8, 1863.	Amputat'n of index finger with greater portion of metacarpal bone. Ass't Surg. P. Adolphus, U. S. A.	Returned to duty Sept. 11, 1863.
96	Mansur, J., Pt., H, 8th New Hampshire, age 41.	———	Left mid. finger affected with an ill-conditioned sore, probably from absorption of unhealthy pus; erysipelas; sloughing.	Oct. 17, 1864.	Amputation of middle finger above head of metacarpal bone. A. A. Surg. F. Hassenburg.	Returned to duty Dec. 4, 1864.
97	Martz, J., Corp'l, K, 5th Michigan, age 25.	Jan. 1, 1864.	Comp'nd dislocation of second finger, left hand; extensive necrosis.	April 10, 1864.	Amputation of second finger with head of metacarpal bone. A. A. Surg. D. O. Farrand.	Useful hand. Returned to duty July 5, 1864.
98	Peoples, R., Pt., B, 151st Illinois, age 45.	Mar. —, 1865.	Ulcer of phalangeal bone of left index finger, result of a felon; extensive slough.; erysipelas.	April 14, 1865.	Flap amputat'n of index finger and one half of metacar. bone. A. A. Surg. W. J. R. Holmes.	Discharged June 7, 1865.
99	Taylor, J. T., Pt., C, 83d Pennsylvania, age 24.	Dec. —, 1863.	Severe burn of right and left hands; necrosis.	Mar. 18, 1864.	Amputation of fifth finger with entire metacarpal bone. A.A. Surg. J. O. French. (Jan. —, 1864, amputation left index and middle fingers.)	Discharged September 9, 1864; stump healed.
100	*Tracey, T.*, Pt., M, 1st Louisiana Cavalry, age 27.	Oct. 5, 1864.	Left thumb severely bitten in a fight; necrosis; sloughing.	Nov. 5, 1864.	Amp. of thumb and metacarpal bone at its trapezial attachment. A. A. Surg. J. C. Lee.	Healed. Returned to Provost Marshal November 23, 1864.
101	Wadley, M., Pt., H, 9th N. Hampshire, age 35.	Nov. 22, 1864.	Poisoned second finger from dressing wounds.	Nov. 22, 1864.	Amputation second finger with head of metacarpal bone.	Discharged May 29, 1865.
102	Wren, J., employé Military Railroad, age 18.	Jan. 9, 1865.	Left thumb cont. and crushed; accident.	Jan. 9, 1865.	Amputat'n of thumb with metacarpal bone at carpal articulation. A. A. Surgeon S. T. Buck.	Discharged from hospital January 26, 1865.

Amputations in the Lower Extremities.—They comprise five hundred and ninety-seven operations performed on five hundred and eighty-three patients, as follows:

One hundred and twenty-eight were amputations of the toes, followed in two instances by re-amputations in the foot, in four by amputations in the leg, and in one by re-amputation in the thigh. Forty-nine were ablations in the foot with one re-amputation in the leg; five were disarticulations at the ankle joint; two hundred and fifty-four were amputations

in the leg with five re-amputations in the thigh; four exarticulations at the knee joint with one re-amputation in the thigh; one hundred and forty-two were ablations in the thigh, and one an exarticulation at the hip joint.

CASE 996.—*Amputation at the hip joint.*—Private J. W. Spradling, Co. A, 33d Illinois, was wounded in the right side and back by a shell at Black River Bridge, May 17, 1863. He passed through various hospitals and was lastly admitted to Moand City on January 25, 1864. Surgeon H. Wardner, U. S. V., in charge of the latter, recorded the following description of the injury:[1] "The missile struck the right side between the ilium and lower rib, inflicting a wound six by nine inches. Cold-water dressings were applied for four weeks, and afterwards simple cerate. The wound healed kindly in about three months. About five or six days after the reception of the wound a bedsore commenced forming on the left hip, which was attacked with gangrene, causing sloughing of the soft parts and exposure of bone. This continued sore for ten months. By March 22d the sore had entirely healed up, but the patient had no use as yet of the leg, the integuments being adherent to the bone. Feeling in the leg and foot was almost normal; but feeling in the thigh was rather dead, though improving. The patient was able to walk about on crutches." He was discharged from service for disability April 3, 1864, and pensioned in pursuance of a certificate by Examining Surgeon A. H. Kellogg, of Clinton, Illinois, who stated that "the applicant now has partial paralysis of both lower extremities, resulting from the effects of the wound, and incapacitating him for obtaining his subsistence by labor." Examiner J. Wright, of Clinton, reported March 25, 1867: "The original wound was in the right lumbar region, which has healed, leaving a large cicatrix. While being treated in hospital a bedsore formed on the left hip which was attacked by hospital gangrene, destroying the muscles, cellular tissues, periosteum, and injuring the bone. This wound partially healed, leaving four and sometimes five fistulous openings communicating with the femur, there being also anchylosis of the hip and knee joints. He has been laying on his right side for over three years, being unable to be turned over or to sit up, and requiring a nurse all the time. I amputated the left leg at the hip joint on the 20th day of February, 1867. The wound is nearly healed and will get well, I think. How much the other limb will be worth is more than I can tell now." One year later the same examiner reported that "the right leg is perfectly useless; he cannot bear his weight on it nor use it with the aid of crutches, and requires an attendant constantly." At a subsequent date Dr. Wright certified that he continued as the attending physician of the pensioner, who was taken with diarrhœa, and then "dropsy followed and continued off and on until the date of his death on September 28, 1872."

CASE 997.—*Amputation in the thigh.*—Private C. W. Barnes, Co. I, 95th New York, aged 23 years, was admitted to Mower Hospital, Philadelphia, May 6, 1863, suffering from osteo-cephalomatous tumor of the right tibia. Surgeon J. Hopkinson, U. S. V., reported: "The history of this patient's case is as follows: While he was assisting in building a wharf at Aquia Creek about June 20, 1862, he fell and bruised himself over the spine of the right tibia. He was soon able to resume duty, but in about ten days after the accident he noticed a small lump growing on his leg. This gave him no annoyance and he remained with his regiment until the battle of Bull Run, August 29, 1862, when he was taken prisoner. He remained in captivity until the following December, when he was paroled, sent to Annapolis, and thence back to his command. He now continued to perform the duties of a soldier until February 20, 1863, when he was again excused on account of the swelling, and one month later he was sent to Douglas Hospital, whence he was transferred here. The tumor in the mean time had gradually grown larger, attaining the size of a goose egg by July 29th, when it was decided to remove it, which was accordingly done by Assistant Surgeon C. R. Greenleaf, U. S. A. In a few days, however, it began to reappear in the wound, and large portions of it were removed on August 20th by the same operator, after which it was not long before it again showed signs of returning, and amputation was decided upon. The limb was taken off, after gaining the patient's consent, on October 17th, at the lower third of the thigh, by Acting Assistant Surgeon J. H. Jamar. But little hæmorrhage attended the operation, which was performed by the antero-posterior flap method, four ligatures being applied. Chloroform constituted the anæsthetic and the patient reacted promptly. The wound united by first intention, and by November 8th the stump had almost entirely healed, there being no indication of reappearance of any tumor. The tumor, when removed, had been examined by Dr. J. M. Da Costa, of Philadelphia, and pronounced to be undoubtedly carcinomatous." The patient was subsequently transferred to Haddington Hospital, where he was supplied with a "Palmer" artificial limb. He was ultimately discharged from service, at Broad Street Hospital, December 16, 1864, and pensioned. A wet preparation of the shaft of the tibia of the amputated limb, exhibiting the tumor at the upper third of the bone, was contributed to the Museum by the operator, and constitutes specimen 2779 of the *Surgical Section*. The pensioner was inspected on February 1, 1882, by Examining Surgeon O. Warner, of Paterson, New Jersey, who reported that he found the "stump small, shrunken, painful, tender, and sore on the end, so that it is impossible for an artificial limb to be worn with any comfort or benefit."

FIG. 370.—Compound comminuted fracture of left femur. *Spec.* 2455.

CASE 998.—*Amputation in the thigh.*—Dr. D. Stanton, late Surgeon U. S. V., reports that "John Meyer, who represented himself as a discharged soldier of a Minnesota regiment, on his way to his home, was left by reason of an attack of remittent fever at New Brighton, Pennsylvania, where, during a fit of delirium on January 9, 1866, he jumped from a second-story window to the ground, a distance of twenty feet. When called to see him I found a compound comminuted fracture of the left femur extending about four inches above the condyles, the upper end of the bone protruding through the skin and pantaloons. The condyles were split apart and the patella was slightly fractured. I amputated at the junction of lower and middle thirds of the bone, making anterior and posterior flaps. Two arteries were ligated. Union through almost the entire extent took place by first intention, and in six weeks the stump was entirely healed and of very good shape." The amputated portion of the femur and the patella (*Spec.* 2455), contributed to the Museum by the operator, are represented in the adjoining wood-cut (FIG. 370), showing the line of the operation to have

[1] WRIGHT (JOHN), *Amputation at the Hip Joint*, in *Cincinnati Lancet and Observer*, 1868, Vol. XI, p. 257. *Circular* No. 2, S. G. O., p. 109.

passed through a small exostosis. No subsequent history of the patient has been ascertained. There is no record of his ever having applied for pension.

CASE 999.—*Amputation in the thigh.*—Private P. O'Reilly, Co. F, 5th New York Heavy Artillery, aged 40 years, had both his legs horribly mutilated by the car wheels of a railroad train near Baltimore, November 5, 1864. He was conveyed to Patterson Park Hospital, where the right thigh was amputated at the middle third by Surgeon T. Sim, U. S. V. The patient then was so rapidly failing that it was considered useless to proceed with any further operation on the other limb. He was insensible at the time of admission and remained so up to his death, which occurred four hours afterwards. The amputated portions of the leg were forwarded, with the history, by the operator, and form specimen 3470 of the *Surg. Sect.* of the Museum.

TABLE CX.

Condensed Summary of One Hundred and Forty-nine Amputations in the Thigh for Miscellaneous Injuries or Diseases.

[Recoveries, 1—90; Deaths, 91—149.]

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	Anders, J. J., Pt., E, 65th New York, age 20.	Oct. 19, 1864.	Frac. right leg; fall from horse; leg shortened and atrophied; toes paralyzed; exostosis.	June 20, 1868.	Flap amputation at lower third of thigh. Dr. A. Marsh, Albany, N. Y.	Recovery. (Disch'd June 5, '65.) Died March 31, 1870; absorption of pus.
2	Anderson, M., Pt., K, 115th Illinois.	Oct. 5, 1862.	Right leg injured; railroad accident.	Oct. 5, 1862.	Flap amputation at lower third of thigh.	Discharged.
3	Barnes, C., Pt., I, 95th New York, age 23.	June —, 1862.	Injury of the right leg; osteo-cephalomatous tumor of tibia; tumor removed.	Oct. 17, 1863.	Antero-posterior flap amputat'n at lower third of right thigh. A. A. Surg. J. H. Jamar.	Discharged November 5, 1864. *Spec.* 2779, A. M. M.
4	Beard, R., Landsman, U. S. Navy, age 31.	Sept. 1, 1864.	Left leg caught in engine on board steamer Alabama.	———	Amputation of thigh 6 inches below trochanter major.	Discharged Aug. 9, 1865; stump puckered and tender.
5	Bergman, J., Pt., 7th New York Battery, age 38.	April 30, 1864.	Comp'nd fract. of lower thirds of right tibia and fibula by a caisson wheel.	July 6, 1864.	Circular amputation at lower third of thigh. A. A. Surg. E. Curtis.	Wound healed, leaving a good stump. Discharged December 2, 1864.
6	Bice, J. A., Pt., C, 95th New York.	Dec. —, 1864 to 1865.	Phlegmonous erysipelas, right foot and leg, caused by exposure to wet and cold.	May 23, 1865.	Amputation at middle third of thigh. Dr. H. B. Salmon, Stuyvesant, N. Y.	Discharged October 5, 1865.
7	Blackburn, J., Pt., B, 19th Illinois.	Sept. 17, 1861.	Right leg mashed from knee to ankle; accident.	Sept. 17, 1861.	Amp. at lower third of thigh. Dr. R. G. Bogue, Chicago.	Discharged October 4, 1861.
8	Boderker, G., Pt., C, 6th Missouri, age 39.	Nov. 6, 1863.	Run over by ammunit'n wagon, fractur'g right tibia at middle. Extensive supp. and necrosis. Jan. 3.4, hæm. fr. post. tib. art.	Jan. 4, 1864.	Circular amputation at upper third of thigh. Surg. N. Gay, U. S. V.	Discharged.
9	Bolton, P., Serg't, F, 51st New York.	June 7, 1863.	Left limb injured by railroad accident.	June 10, 1863.	Flap amput'n at middle third of thigh. Surg. J. T. Carpenter, U. S. V.	Discharged.
10	Bowen, T., Pt., E, 13th New York.	Sept. 8, 1862.	Fracture of the left leg; railroad accident.	Sept. 29, 1862.	Amputation at middle third of thigh. A. A. Surg. W. Sargent.	Discharged Feb. 16, 1863. Piece of bone subsequently removed from stump.
11	Bruce, C., Pt., K, 95th Illinois, age 37.	Dec. 19, 1864.	Compound comminuted frac. at upper third of left leg; railroad accident.	Dec. 19, 1864.	Circular amputation at middle third of thigh. Surg. S. E. Fuller, U. S. V.	Discharged.
12	Buckridge, J. N., Pt., C, 6th New York Artillery.	——— 1864.	Axe wound of right foot, severing tarsus and metatarsus; erysipelas; gangrene.	May 27, 1864.	Antero-posterior flap amputat'n of thigh near junct. of middle and lower thirds. Surg. D. W. Bliss, U. S. V.	May 30, slight hæmorrhages; recovered.
13	Burgess, O. S., Pt., L, 8th New York Artillery, age 18.	———	Scrofulous inflammat'n of right knee joint; anchylosis; cartilages disorganized; hæmorrh.	Nov. 20, 1864.	Circular amputation at lower third of thigh. Surg. R. W. Pease, U. S. V.	Necrosis of stump. Discharged May 31, 1865.
14	Burns, J., Pt., A, 17th New York, age 21.	June 20, 1865.	Right foot and left thigh at middle third fractured; railroad accident.	June 20, 1865.	Circular amputation at upper third of left thigh. A. A. Surg. R. P. Johnson. Amputation right leg, lower third.	Stumps ulcerated. Discharged November 14, 1865.
15	Carlisle, J. L., Recruit, 10th Michigan Cavalry, age 21.	Feb. 29, 1865.	Injury of right knee and fracture of tibia; railroad accid't; inflammation in knee joint.	June 26, 1868.	Amputation at middle third of right thigh. Dr. D.W. Flora, Chicago, Illinois.	Discharged August 5, 1865; recovered.
16	[1]Cator, A., Pt., G, 48th New York, age 21.	——— 1861.	Wrenched his right leg; osteo-sarcoma of fibula; leg much swollen, red, and tender.	July 21, 1862.	Flap amputation at junction of middle and lower thirds. Dr. W. Parker, New York.	Discharged July 8, 1863.
17	Chapman, O.W., Pt., E, 76th Pennsylvania.	———	Scurvy; extensive ulceration of right leg, exposing 6 inches of tibia.	Aug. 20, 1865.	Amputation at lower third of thigh. Dr. A. Strong, Honesdale, Penn.	Discharged July 29, 1865; recovered, with sound stump.
18	Clarke, T.W. Chaplain, 99th New York, age 42.	May 10, 1862.	Injury of left second toe; deformity and partial dislocat'n.	Feb. 7, 1872.	Amputation at lower third of thigh. Dr. J. Homans, late Ass't Surg. U. S. A.	Disch'd Feb. 11, 1863. (Nov. 26, 1862, amputation toe; Jan. 21, 1863, amputat'n low. third leg.)
19	Coe, S., Col'd Pioneer Corps.	Aug. 11, 1863.	Falling tree crushed the left leg.	Aug. 11, 1863.	Flap amputat'n at middle third of thigh.	Returned to regiment September 22, 1863.
20	Collier, L., Pt., I, 6th Missouri, age 17.	Sept. 25, 1861.	Right thigh crushed by a wagon.	Oct. 4, 1861.	Flap amputat'n at middle third of thigh.	Transferred to Veteran Reserve Corps.
21	Concannon, E. C., Corp'l, H, 9th Veteran Reserve Corps, age 24.	May 4, 1864.	Fracture left tibia and fibula; laceration lower third of right thigh; railroad accident.	May 4, 1864.	Antero-post. flap amputat'n at junct. of mid. and lower thirds of left thigh. Surg. E. Bentley, U. S. V.	Discharged January 27, 1865; stump very well shaped. *Spec.* 2550, A. M. M.
22	Dillon, R., Pt., F, 5th New York.	Nov. 23, 1861.	Injury of right knee by fall of a fence.	Secondary.	Flap amp. at upper third thigh. Surg. G. Taylor, U. S. A.	Discharged December 13, 1862.
23	Drysdell, H., Pt., E, 71st Pennsylvania.	Sept. 28, 1863.	Railroad cars crushed the right leg.	Sept. 28, 1863.	Antero-posterior flap amputa'n at lower third of thigh.	Discharged
24	Duncan, G. W., Pt., F, 21st Pennsylvania Cav., age 16.	———	Strumous synovit. left knee j't; large amount of pus deeply seated in the joint; necrosis of external condyle.	June 19, 1864.	Circular amputation at lower third of thigh. Ass't Surg. C. Wagner, U. S. A.	Recovered.
25	Dunn, W. F., Pt., I, 192d Pennsylvania, age 20.	Aug. 12, 1864.	Right leg crushed; railroad accident. Aug. 12, amputation leg; stump diseased.	Jan. 1, 1865.	Amp. of thigh at lower third. A. A. Surg. F. F. Maury.	Discharged.

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
26	Flanary, J., Pt., B, 5th New York Heavy Artillery.	———	Hydrarthrus of left knee joint.	April 26, 1865.	Flap amput'n at middle third of thigh. Medical Cadet Stille.	Discharged.
27	Gallagher, L., Pt., A, 69th Ohio, age 18.	Jan. 31, 1865.	Comp'nd comminuted fract. of right leg; railroad accident.	Jan. 31, 1865.	Flap amp. at lower third thigh. Surg. C. McDermont, U. S.V.	Disch'd March 2, 1866. (Amputation left arm Sept. 2, 1864.)
28	Gleeson, H., Pt., A, 140th New York, age 27.	——— 1864.	Scurvy of both legs, resulting in mortification.	April 25, 1865.	Amp. at middle third of right thigh. Dr. A. M. Leonard, Lockport, N.Y. June 7, 1865, amputation left leg.	Subsequent operations. Disch'd August 29, 1865; stump healed but tender.
29	Godfrey, T., Pt., H, 22d Kentucky Artillery, age 35.	Feb. 26, 1864.	Fract. of leg ext. into knee j'nt and comp'nd fract. ankle j't; crush. bet. ferryboat and dock.	Mar. 29, 1864.	Circular amputation at lower third of thigh. A. A. Surg. N. F. Marsh.	Discharged June 11, 1864.
30	Green, O. F., Lieut., D, 16th West Virginia, age 43.	———	Injury of right leg by a fall; lameness. Must. out June 10, 1863. Enlargement of artery behind knee; gangrene.	Oct. 7, 1863.	Amputation of thigh 6 inches from hip. Dr. J. Swinburn, Albany, N. Y.	Recovered; bone tilted upward and forward by action of muscles in stump.
31	Haspell, F., Pt., B, 39th Illinois, age 39.	———	Anchylosis of left knee joint; necrosis of femur and tibia; diseased bones fractured by accident.	Oct. 17, 1867.	Amputation at lower third of thigh. Dr. J. H. Thompson, surgeon at Soldiers' Home, Milwaukee, Wis.	Discharged Dec. 22, 1863. Recovered.
32	Hooks, H. A., Pt., G, 78th Pennsylvania.	Sept. 29, 1864.	Right tibia, fibula, and patella fractured; railroad accident.	Sept. 29, 1864.	Circular amputation at lower third of thigh. A. A. Surg. S. T. Williams.	Discharged February 15, 1865.
33	Hornbeck, S. S., Pt., F, 28th Kentucky.	Aug. 15, 1862.	Injury of left limb; railroad accident.	Aug. 16, 1862.	Amp. at middle third of thigh. Surg. G. W. Ronald, 34th Ky.	Discharged September 25, 1863.
34	Hutchinson, A., contraband, age 55.	Mar. 5, 1864.	Thigh crushed by a falling tree.	Mar. 10, 1864.	Post. flap amp. at upper third thigh. Surg. F. E. Piquette, 86th Colored Troops.	Discharged from hospital Nov. 27, 1864.
35	Jackson, E. H., Serg't, D, 2d Michigan Cavalry, age 31.	Sept. 1, 1864.	Left tibia injured by chafe of stirrup; disease inv. knee j'nt.	Jan. 14, 1869.	Amp. at lower third thigh. Dr. Z. E. Bliss, late Surg. U. S.V.	Mustered out August 17, 1865. Recovered.
36	Kalbfleish, J., Pt., A, 116th Ohio, age 27.	Feb. 24, 1864.	Compound fract. of right tibia, fibula, and ankle; crushed by car wheel.	Feb. 24, 1864.	Antero-posterior flap amputat'n lower third thigh. Surg. T. J. Shannon, 116th Ohio.	Discharged May 15, 1865.
37	Keller, F., Pt., E, 18th Ohio, age 21.	Jan. 24, 1865.	Fracture middle third of right femur; railroad accid't; mortification.	Feb. 25, 1865.	Circular amputat'n upper third of thigh. Dr. B. Tappan, Steubenville, Ohio.	Discharged September 29, 1865; stump healthy. (Also a shot wound of right leg Dec., 1864.)
38	Kennedy, P. A. B., Pt., B, 36th Indiana.	———	Scrofula; r't ankle, knee, and wrist affected by tuberculosis. Destruct. bony and soft parts.	Feb. 25, 1864.	Amputation at lower third of right thigh. Dr J. M. Yonant, Indianapolis.	August 16, 1864, amputation of right forearm. Mustered out September 21, 1864.
39	Kennedy, W., Pt., C, 37th Illinois.	Jan. 5, 1863.	Leg broken by accident	Mar. 9, 1863.	Flap amputat'n at upper third of thigh. Ass't Surg. S. D. Carpenter, U. S. V.	Discharged June 14, 1864.
40	Lambert, H. M., Serg't, D, 12th Illinois Cav., age 29.	Oct. 10, 1863.	Comminuted fracture of right leg at middle third by fall of horse.	Nov. 10, 1863.	Double flap amputat'n at lower third. A. A. Surgeon W. H. Ensign.	Disch'd July 30, '64. *Specs.* 1744, 1879, A. M. M. (Oct. 25, 1863, amp. leg; Nov. 8, 26, hæmorrh.)
41	Lewis, P., Musician, G, 183d Ohio.	July 20, 1865.	Fracture of right leg; railroad accident.	July 20, 1865.	Flap amputat'n at middle third of thigh.	Recovery.
42	Lindsay, W., Corp'l, I, 81st Colored Troops, age 35.	Mar. 20, 1865.	Accid'tal injury left knee joint; pus in and around joint; inflammation.	Aug. 12, 1865.	Circular amput'n at lower third thigh. Surg. F. E. Piquette, 86th Colored Troops.	Discharged December 4, 1865.
43	Little, T. W., Pt., L, 10th Indiana Cavalry.	May 5, 1864.	Compound fracture of left tibia and fibula; railroad accident.	May 26, 1864.	Flap amputation at lower third of thigh. Surg. C. N. Hoagland, 71st Ohio.	Discharged October 16, 1864.
44	Long, S., Pt., E, 5th Kentucky Cavalry, age 40.	June 24, 1863.	Left leg fractured; fall of horse; erysipelas; gangrene.	Oct. 27, 1863.	Circular amput'n middle third thigh. Ass't Surg. J. E. Link, 21st Illinois.	Discharged July 11, 1864.
45	Lynch, H., Pt., G, 15th Connecticut, age 35.	Aug. 28, 1862.	Injury of left knee by a fall; periostitis and ostitis; enlargement of head of tibia.	Jan. 24, 1865.	Amputat'n at lower third thigh. Dr. F. Bacon, of the Conn. State Hospital.	(Discharged September 13, 1863.) Recovered.
46	McCabe, J., Pt., A, 23d Illinois, age 33.	Sept. 20, 1862.	Left limb injured by railroad accident.	Sept. 20, 1862.	Flap amputation at upper third of thigh.	Discharged September 30, 1863.
47	McLay, W., Pt., G, 12th Illinois.	——— 1856.	Bones of right leg fractured by machinery; necrosis and displacement of fractured ends.	Jan. 15, 1864.	Lateral flap amputat'n at lower third of thigh. Surg. J. G. Keenon, U. S. V.	Discharged July 5, 1864. (Nov. 3, 1863, amputation leg; gang.)
48	Marcellus, L., Pt., B, 94th New York.	———	Gangrene of right leg and foot from exposure.	April 30, 1865	Circular amputation at lower third of thigh.	Discharged November 3, 1865.
49	Marshall, W., Pt., A, 55th Pennsylvania.	Aug. 4, 1863.	Sprain of right ankle; disorganization of tibia and astragalus.	Mar. 4, 1865.	Circular amputat'n lower third of thigh. Dr. T. St. Clair, Blairsville, Penn.	Mustered out August 26, 1863. Recovered.
50	Martindale, L., Pt., K, 54th Indiana, age 25.	Nov. 1, 1863.	Leg crushed, extending into knee joint; femur obliquely fractured; railroad accident.	Nov. 1, 1863.	Circular amputation at lower third of right thigh. Ass't Surg. J. Homans, jr., U. S. A.	Discharged December 15, 1863.
51	Maxwell, J., Pt., K, 176th New York.	———	Old extensive necrosis of left tibia; inflamm. of knee joint.	May —, 1865.	Antero-post. flap amp. at junc. of lower thirds of thigh. Dr. Todd, Tarrytown, N. Y.	Discharged January 30, 1864.
52	Meyer, J., discharged soldier, Minnesota regiment.	Jan. 9, 1866.	Compound comm. fract. lower third left femur into knee j'nt; jumped from 2d story window.	Jan. 9, 1866.	Antero-post. flap amp. at junc. of lower thirds of thigh. Dr. D. Stanton, late Surg. U. S.V.	Stump entirely healed in six weeks. Recovered. *Spec.* 2455, A. M. M.
53	Morton, C. L., Pt., I, 4th Michigan Cavalry.	Oct. 14, 1862.	Right knee; kicked by a horse.	Oct. 14, 1862.	Flap amp. low. third thigh. Dr. E. Thorn, Constantine, Mich.	Discharged February 27, 1863.
54	Murdock, G., Pt., A, 23d Illinois, age 28.	May 16, 1864.	Severe contus. left leg; accid't; sloughing; gang. of foot; pus burrowed along popliteal vein and in it.	June 6, 1864.	Circular amputation at lower third of thigh. A. A. Surg. R. N. Isham.	Progress steady but slow. Mustered out June 24, 1865.
55	Myers, J., Pt., L, 4th Ohio Cavalry.	June 6, 1863.	Injured by railroad accident ..	June 6, 1863.	Amputation at lower third of right thigh.	Discharged January 7, 1865.
56	O'Brien, F., Pt., A, 4th New York.	Feb. —, 1862.	Axe wound of the left knee; necrosis.	Secondary.	Amputat'n at middle third of thigh, lateral flaps. Surg. G. Taylor, U. S. A.	Discharged April 28, 1863. *Spec.* 919, A. M. M. (Case 524, p. 362, *ante.*)
57	Pflueger, F., Pt., H, 8th N. York, age 37.	July 21, 1861.	Injury of left knee joint by fall; caries of cartilage of knee.	July 7, 1863.	Circular amputat'n at middle third left thigh. A. A. Surg. C. F. Heuser.	Discharged September 5, 1861. Recovered July, 1865.
58	Phillips, J., Pt., A, 1st Michigan Cavalry.	April 10, 1864.	Contusion, result'g in synovitis left knee.	Nov. 26, 1866.	Circular amput'n middle third of thigh. Dr. D. O. Farrand, Detroit, Mich.	Recovered. (Discharged Jan. 11, 1866.)
59	*Pierce*, A., Pt., C. S. Engineers, age 45.	Aug. 2, 1864.	Injury of right leg; boiler explosion, Steamer Anna Lyon.	On field.	Amputation at middle third of thigh.	Discharged from hospital November 2, 1864.

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
60	Pittman, W. H., Pt., E, 4th Tenn. Cavalry, age 38.	1864.	Ulcers on left leg from scurvy resulting from imprisonment.	Aug. 27, 1865.	Amputation lower third of left thigh. Dr. J. D. Ketcherside, Ducktown, Tenn.	Discharged June 16, 1865; bad stump; bone protruding. Recovered.
61	Powell, J., Pt., E, 28th Pennsylvania.	Jan. 5, 1862.	Fell from horse and injured r't leg: caries of tarsus, tibia, and fibula; erysipelas; abscesses.	July 6, 1862.	Teale's rectangular flap amp. at middle third thigh. Ass't Surg. R. Bartholow, U. S. A.	Discharged December 12, 1862.
62	Putnam, G. A., Pt., E, 2d Colorado Cavalry, age 24.	———	Anchylosis left knee; chronic enlargement of knee joint.	Mar. 17, 1867.	Flap amputation at lower third of thigh. Dr. T. B. Dearborn, Hillsborough, N. H.	Discharged February 13, 1864. Recovered.
63	Quinn, P., inmate of Soldiers' Home, age 54.	——— 1862.	Scrofulous inflammation disorganizing right knee; abscess.	Sept. 3, 1864.	Amput'n at lower third thigh. Surg. R. B. Bontecou, U. S. V.	Healed by first intention. Returned to Soldiers' Home cured.
64	Randolph, W. M., Pt., A, 10th Missouri Cav., age 21.	July 3, 1864.	Right lower limb kicked by a horse; extensive suppuration: knee joint disorganized, with ulceration of bones.	April 8, 1865.	Double flap amput'n at middle third of thigh. Surg. J. R. McClurg, U. S. V.	Discharged May 27, 1865.
65	Roberts, L., Pt., G, 12th Wisconsin, age 24.	May 2, 1864.	Right leg injured; railroad accident.	May 2, 1864.	Flap amput'n low. third thigh. June 18, 3 ins. bone removed.	Discharged Mar. 24, 1865. *Specs.* 2990, 3698, A. M. M.
66	Robinett, M. B., Musician, B, 2d Maryland P. H. B.	April 11, 1863.	Railroad cars crushed the left leg.	April 11, 1863.	Amputation at lower third of thigh. Surg. S. P. Smith, 2d Maryland P. H. B.	Discharged August 19, 1864.
67	Seoville, E., Pt., E, 123d N. York, age 20.	Dec. 20, 1864.	Contusion from fall of tree; necrosis left tibia.	Feb. 18, 1865.	Circular amput'n at lower third of left thigh. Surg. J. Reily, 33d N. J.	Discharged August 5, 1865.
68	Sealey, D. K., Pt., C, 74th Illinois.	Oct. 7, 1864.	Fracture both legs; bad comm. of right leg; railroad accid't.	Oct. 25, 1864.	Circular amputation at lower third of right thigh.	Discharged February 28, 1865.
69	Shenerman, J., Pt., K, 10th Ohio Cavalry, age 34.	May 1, 1865.	Right femur crushed by railroad accident.	May 11, 1865.	Flap amputat'n at middle third of thigh.	Discharged August 22, 1865.
70	Smith, R. H., Pt., D, 3d W. Virginia, age 38.	July 24, 1864.	Compound comminuted fract. right leg; railroad accident.	July 25, 1864.	Antero-post. flap amputation at lower third of thigh. Surg. S. N. Sherman, U. S. V.	August 1, hæmorrhage; ligation of popliteal artery. Mustered out September 3, 1864.
71	Southard, J. W., refugee, age 14.	———	Scrofulous affection of lower part of right thigh and knee.	Oct. 5, 1864.	Circular amp. at middle third of thigh. Surg. H. Wardner, U. S. V.	December 31, exfoliation from femur removed. July 31, 1865, stump healed. Left for home.
72	Sowle, H. A., Pt., G, 5th Michigan Cav., age 28.	———	Mortification of left leg from defective circulation and innervation.	Oct. 18, 1862.	Amput'n of left thigh at lower third. Dr. C. W. Topping, DeWitt, Mich.	Discharged Oct. 2, 1862; unable to wear artificial limb.
73	Spragg, G., Pt., G, 1st Kansas, age 33.	Mar. 12, 1862.	Left knee cut just above joint by an axe.	About April 12, 1862.	Amputation at middle third of thigh. Surg. H. Nauman, 9th Wis.; subsequent operation.	Discharged April 19, 1863. 1870, stump sound and healthy.
74	Stanber, W., Pt., L, 14th Illinois Cavalry.	Feb. 20, 1863.	Erysipelas resulting from cold.	April 4, 1863.	Amp. at middle third left thigh. A. A. Surg. E. Andrews.	Discharged December 4, 1863. Died September 10, 1872.
75	Straw, P., Pt., G, 203d Pennsylvania.	Mar. 3, 1865.	Left leg, kicked by a horse....	Mar. 26, 1865.	Flap amputation at lower third of thigh.	Mustered out June 23, 1865.
76	Sullivan, E. O., Serg't, K, 18th Missouri Mounted Volunteers, age 38.	Oct. 14, 1863.	Fract. middle right femur; accident; limb shortened and flexed at knee.	July 1, 1865.	Flap amputation at mid. third of thigh.	(Mustered out February 27, '65.) Recovered.
77	Tanner, D. B., Pt., D, 1st R. Island Light Art., age 26.	Oct. 6, 1861.	Right leg fractured by a kick from a horse; erysipelas.	Secondary.	Amputation at middle third of thigh. Ass't Surg. J. W. S. Gouley, U. S. A.	Discharged April 7, 1862. *Spec.* 21, A. M. M.
78	Tarwater, H. C., Pt., C, 61st Tennessee, age 24.	Jan. 26, 1865.	Injury of left ankle joint, fract. external malleolus; contusion of foot; erysipelas.	Feb. 6, 1865.	Circular amputation at lower third of thigh. Ass't Surg. C. Bacon, jr., U. S. A.	Discharged May 16, 1865.
79	Trowbridge, L. M., Corp'l, F, 6th West Virginia, age 28.	Oct. 24, 1864.	Left leg entirely severed at knee, severe burn over sacrum, nates, and both thighs; railroad accident.	Oct. 24, 1864.	Flap amputation at mid. third of left thigh. Surg. S. N. Sherman, U. S. V.	Gangrene. December 11, 1864, 2 inches of protruding bone sawn off; recovered.
80	Tscholl, J., Pt., D, 12th Missouri, age 28.	Oct. 1, 1863.	Fracture of left femur; railroad accident.	Oct. 1, 1863.	Circular amputation at upper third of thigh.	Mustered out August 15, 1864. Died Jan. 25, 1868, of phthisis pulmonalis.
81	Utter, J., Drummer, F., 5th Ohio.	Oct. 6, 1863.	Injured by a railroad accident.	Oct. 6, 1863.	Amputation at upper third of left thigh.	Discharged January 30, 1864.
82	Van Inwagen, A., Pt., B, 111th New York, age 37.	Oct. 12, 1864.	Left tibia and fibula fractured at lower third; railroad accident.	Oct. 23, 1864.	Antero-posterior flap amputat'n at lower third of thigh. Surg. W. O'Meagher, 9th N. Y.	Carious bone remov'd from stump. Discharged September 4, 1865.
83	Van Nordstrand, D., Wagoner, H, 12th Indiana Cav.	Oct. 9, 1864.	Injury of left lower extremity; railroad accident.	Jan. 24, 1865.	Flap amputation at mid. third of thigh. Dr. J. N. Green, South Bend, Indiana.	Discharged May 25, 1865.
84	Webber, C., Pt., 8th Co. N. York Ind. Vols.	——— 1863.	Axe wound 2 inches above patella, suppuration extending into knee joint.	Oct. 4, 1863.	Amputat'n at junction of lower thirds of left thigh. Surg. D. P. Smith, U. S. V.	Discharged. *Spec.* 2004, A. M. M. (CASE 8, p. 8, *ante.*)
85	Weiser, A., Pt., A, 65th Illinois.	Aug. 17, 1863.	Foot fractured and tibia split into knee joint; railroad accident.	Aug. 17, 1863.	Circular amputation at lower third of thigh. Ass't Surg. I. Brown, 65th Illinois.	Discharged April 23, 1864.
86	Welch, J. M., Serg't, A, 24th Massachusetts.	Feb. 8, 1862.	Sprain of left leg; ulceration of knee joint.	Aug. 1, 1863.	Circular amp. low. third thigh. Dr. H. J. Bigelow, Boston.	Discharged March 26, 1863; recovered.
87	Wheeler, C., Pt., I, 2d Ohio Heavy Artillery, age 18.	Jan. 29, 1865.	Comp'd comm. fract. mid. third left thigh; railroad accident.	Jan. 30, 1865.	Flap amp. at upper third thigh. A. A. Surg. T. W. Baugh.	Feb. 8 and 14, hæmorrhage. Discharged June 2, 1865.
88	Wilkinson, J. W., Pt., D, 6th New Hampshire.	May 29, 1862.	Accidental injury right leg and knee; inflam. and sup. knee j't.	Sept. 29, 1863.	Flap amp. at upper third thigh. Dr. T. Haynes, Concord, N.H.	Discharged September 22, 1862; recovered.
89	Williams, R. A., Pt., F, 184th Pennsylvania, age 19.	———	Typhoid fever, resulting in ulceration of right leg and disease of bone.	June 16, 1864.	Flap amputation at mid. third of thigh. Dr. J. B. Mitchell, Bellefonte, Penn.	Discharged October 9, 1866.
90	Zachman, S., Pt., D, 82d Ohio.	Oct. 2, 1863.	Left thigh crushed; railroad accident.	Oct. 2, 1863.	Flap amputation at junction of upper and mid. thirds of thigh. Dr. J. C. Reeve, Dayton, Ohio.	Discharged.
91	Allee, M. J., Corp'l, I, 33d Indiana, age 22.	June 17, 1865.	Punctured wound of right knee joint by the point of an axe; synovitis.	July 31, 1865.	Amputation at middle third of right thigh. A. A. Surg. D. J. Griffiths.	Died Aug. 11, 1865, of diarrhœa. See p. 362, *ante.*
92	Allen, —, contraband, age 23.	Nov. 10, 1864.	Comminuted fracture of both knee joints by railroad accident.	Nov. 11, 1864.	Circ. amp. at middle third left thigh; flap amp. right thigh at low. third. Ass't Surg. H. T. Legler, U. S. V.	Died November 11, 1864, from shock, four hours after operat'n.
93						
94	Anderson, D., Conductor U. S. Mil. Railroad, age 25.	May 28, 1865.	Comp'd com. fract. of left tibia and fibula; railroad accident.	May 28, 1865.	Circular amputation at middle third of left thigh.	Died June 25, 1865, of exhaust'n.
95	Ashenhurst, J. D., Pt., H, 8th Kansas, age 22.	Sept. —, 1864.	Axe wound of left thigh and knee, opening joint; gangrene.	Sept. 22, 1864.	Circular amp. at middle third of thigh. Ass't Surg. T. A. McGraw, U. S. V.	Died September 30, 1864, of exhaustion.

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
96	Bowns, W. A., Quartermaster, 15th Conn., age 26.	May 21, 1865.	Comp'd comm. fracture middle third left femur and mid. third right tibia and fibula; railroad accident.	May 21, 1865.	Circ. amp. at upper third of left thigh; amp. right leg. Surgs. C. A. Cowgill, U. S. V., and N. Meyer, 16th Conn.	Died May 21, 1865.
97	Brown, G., Pt., C, 34th Illinois.	Sept. 24, 1864.	Fracture of right leg; railroad accident.	——— 1864.	Amputation at middle third of thigh.	Died December 4, 1864.
98	Caringer, J. L., Pt., G, 141st New York, age 43.	———	Accidental incised wound left foot; gangrene; sloughing.	Jan. 24, 1865.	Circular amp. at low. third left thigh. Surg. G. Grant, U.S.V.	Died January 25, 1865.
99	Cavanry, W., Pt., —, 102d Pennsylvania.	June 14. 1864.	Fracture of right femur by fall; knee joint involved.	June 15, 1864.	Antero-posterior flap amputat'n at middle third of thigh. A. A. Surg. S. G. Minassian.	Died June 15, 1864, of concussion.
100	Cochran, M. F., Teamster, H, 70th New York, age 34.	Nov. 15, 1863.	Fracture of right knee joint; run over by a wagon.	Nov. 15, 1863.	Amputation at middle third of thigh.	Died Dec. 8, 1863, of pyæmia.
101	Conway, J. A., Pt., A, 55th Pennsylvania, age 22.	May 24, 1865.	Comp'd comminut'd fract. right tibia and fibula and left radius and ulna; railroad accident.	May 24, 1865.	Circular amp. at lower third of right thigh and of left arm. A. A. Surg. H. S. Streeter.	Died May 28, 1865, from effects of internal injuries.
102	Curgill, W., Pt., —, 90th New York.	Oct. 29, 1864.	Left foot, leg, and lower third of right thigh crushed; railroad accident.	Oct. 29, 1864.	Amp. right thigh at lower third and left leg. Ass't Surg. C. Bacon, jr., U. S. A.	Died October 29, 1864.
103	Draper, B. F., Serg't, F, 1st Rhode Island Artillery.	Mar. 30. 1862.	Both bones of left leg fractured by kick of a horse.	May 8, 1862.	Circular amputation at lower third thigh.	Died May 27, 1862.
104	Dunn, J., Pt., G, 20th Connecticut.	Nov. 4, 1863.	Comp'd comm. fract. left thigh into knee; railroad accident.	Nov. 4, 1863.	Amputation at lower third of thigh.	Died November 5, 1863.
105	Ely, J. R., Corp'l, H, 12th Infantry, age 24.	———	Fall upon right knee caused scrofulous disease of joint.	Sept. 8, 1864.	Antero-posterior flap amputat'n at upper third of thigh. A. A. Surg. O. D. Norton.	Died September 14, 1864.
106	English, P., U. S. Railroad employé, age 25.	April 11. 1865.	Right leg crushed; railroad accident.	April 12, 1865.	Amput'n at lower third thigh. A. A. Surg. S. T. Buck.	Died April 20, 1865.
107	Foley, M., Pt., G, Marine Artillery, age 28.	Sept. 6, 1862.	Left tarsus lacerated; explos'n of gunboat Picket; gang.	Sept. 14, 1862.	Circular amputation of thigh immediately above knee.	Died October 3, 1862, of tetanus.
108	Frazer, H. C., Pt., A, 40th New York.	June 20. 1862.	Axe injury of left knee joint; gangrene.	Aug. 14, 1862.	Antero-post. flap amputat'n of thigh 6 inches below trochanters. Brig. Surg. J. C. Dorr.	Rapidly sinking. Died Aug. 14, 1862. *Ante*, p. 362.
109	Furgerson, M. A., contraband.	Nov. —, 1863.	Injured by a fall; gangrene from below knee to foot; tibia exposed and partly destroyed.	Feb. 15, 1864.	Circular amputation at lower third of thigh. Surg. D. O. McCord, 9th Louisiana C. T.	Gang. again set in; gangrenous inflammation of throat. Died March 4, 1864.
110	Good, H. J., Serg't, I., 10th Indiana Cavalry, age 29.	May 5. 1864.	Comp'd fracture of lower third of femur; pyæmia; gangrene.	June 24, 1864.	Flap amp. middle third thigh. Surg. C. N. Hoagland, 71st O.	Died June 27, 1864, of pyæmia.
111	Harmer, S., Pt., C, 98th Pennsylvania, age 18.	May —, 1864.	Fracture of right leg; run over by cars.	June —, 1864.	Amp. of thigh just above knee. (May —, 1864, amp. of leg.)	Abscesses forming. Died Aug. 30, 1864, of epilepsy.
112	Hartz, T., Pt., G, 7th Iowa, age 41.	Nov. 4, 1864.	Comm. of right femur at mid. third by railroad accident.	Nov. 10, 1864.	Flap amputation of thigh. A. A. Surg. A. Robillard.	Died December 12, 1864, of gangrene.
113	Hickey, T., Corp'l, E, 3d Michigan Cavalry.	Jan. 21, 1864.	Bones of right leg broken by kick of a mule; gangrene; fractured ends overlapping.	Mar. 29, 1864.	Lateral flap amputation lower third thigh. A. A. Surg. S. S. Jessop.	(March 10, excis. tibia; Mar. 19, ligation posterior tibial artery. Died Mar. 31, '64, of exhaust'n.)
114	Hofer, F., Hospital Steward, U. S. A.	———	Compound fracture of knee j't; accident.	———	Amputation of thigh	Died November 22, 1865.
115	Hume, C. M., Pt., A, 3d Iowa Cavalry.	Dec. 11, 1864.	Fract. both legs, dislo. r't ankle, injury face and chest; explo. steamer Maria; mortifi. r't leg.	Dec. 14, 1864.	Flap amputation at junction of lower thirds right thigh. A. A. Surg. T. F. Rumbold.	Died December 24, 1864.
116	Irmer, C., Pt., —, 86th Ohio, age 23.	Sept. 23, 1864.	Third and 4th met. bones and little toe r't foot crushed and heel lacerated: railr'd accid't; slough'g of foot and leg; inflammation of thigh.	Oct. 10, 1864.	Antero-posterior flap amputat'n nt lower third right thigh. A. A. Surg. C. E. Boyle.	Oct. 19, hæm.: ligation of artery. Died Oct. 29, 1864, of pyæmia. Autopsy: saphenous and femoral veins full of pus.
117	Jennings, D., Pt., C, 37th Iowa, age 52.	Aug. 13, 1864.	Fracture of left tibia; railroad accident; abscesses; mortification.	Aug. 25, 1864.	Circular amputation at upper third of thigh. A. A. Surg. R. W. Coale.	Gangrene of stump. Died Sept. 2, 1864, of pyæmia.
118	Jones, H., Pt., D, 1st New York Cavalry, age 17.	Mar. 13, 1865.	Left leg crushed and right foot contused; railroad accident.	Mar. 13, 1865.	Double flap amputation lower third of left thigh. Act. Staff Surg. N. F. Graham.	Died March 28, 1865.
119	Kellins, D. H., Serg't, G, 81st Indiana, age 30.	Sept. 24, 1864.	Fracture of left leg, including ankle joint; railroad accident.	Sept. 28, 1864.	Double flap amputation middle third of thigh. A. A. Surg. J. B. McPherson.	Died October 1, 1864.
120	King, F. J., Pt., C, 6th Tennessee, age 22.	Jan. 26, 1865.	Comp'd comminuted fracture right tibia, fibula, and lower third femur; railroad accid't.	Jan. 27, 1865.	Circular amp. at middle third of thigh. A. A. Surg. H. S. Streeter.	Semi-moribund. Died January 27, 1865.
121	King, J., freedman	Mar. —, 1864.	Right leg run over by a dray; gangrene.	May 28, 1864.	Circular amp. lower third thigh. A. A. Surg. B. E. Dodson.	Died June 4, 1864.
122	Kitteredge, A., Pt., H, 4th Vermont, age 56.	Jan. —, 1864.	Subcutaneous cellular inflam. left foot and leg; gangrene.	Mar. 18, 1864.	Circular amp. lower third thigh. Ass't Surg. A. Ingram, U.S.A.	Died March 19, 1864, of shock and exhaustion.
123	Leeds, A. P., Pt., H, 10th Indiana Cavalry, age 24.	May 5, 1864.	Laceration of foot around heel and up tendo-achilles; railr'd accident: gangrene in leg.	May 10, 1864.	Flap amputation thigh at lower third. Surg. C. N. Hoagland, 71st Ohio.	Died May 12, 1864, from effects of gangrene.
124	Lindsley, E. D., Pt., D, 114th Illinois.	———	Scrofulous abscess involving left knee joint.	Mar. 16, 1864.	Lateral flap amp at lower third thigh. A. A. Surg. J. E. Wilson.	Died March 20, 1864, of exhaustion.
125	Lucas, S., colored employé Quartermaster's Dep't.	May 9, 1864.	Comp'd comminuted fracture of right tibia and fibula; railroad accident.	May 9, 1864.	Antero-posterior flap amp. at lower third of thigh. A. A. Surg. B. P. Brown.	Sloughing. Died July 1, 1864, of diarrhœa.
126	Matthews, A., Serg't, 82d Co. 2d Vet. Res. Corps, age 31.	May 22. 1864.	Comp'd fracture of left leg near ankle by railroad cars.	June 4, 1864.	Circular amp. lower third thigh. A. A. Surg. G. P. Norris.	Hæmorrhage. Died June 19, '64, of pyæmia.
127	Miller, M. G., Pt., F, 87th N. York, age 23.	Aug. 16, 1862.	Contusion resulting in sloughing ulcer.	Sept. 1, 1862.	Amputation at middle third of thigh.	Oct. 6, hæm. Died Oct. 11, 1862, of marasmus.
128	Moore, M. B., Pt., B, 6th Maryland, age 22.	Dec. 3, 1864.	Injured by railroad accident.	Dec. 25, 1864.	Amputation at juncture lower thirds of right thigh.	Died Dec. 30, 1864, of pyæmia.
129	O'Reilly, P., Pt., F, 5th N. York H'vy Art., age 40.	Nov. 5, 1864.	Both legs mutilated by railroad cars.	Nov. 5, 1864.	Right thigh amput'd at middle third. Surg. T. Sim, U. S. V.	Died November 5, 1864. *Spec.* 3470, A. M. M.
130	Providence, T., Pt., B, 55th Ohio, age 25.	July 4, 1865.	Fract. r't femur and extensive lacerat'n thigh; railr'd accid't.	July 5, 1865	Circular amp. at up. third thigh. A. A. Surg. D. J. Griffiths.	Died July 6, 1865, from effects of shock.
131	Reams, O. F., Pt., B, U. S. Engineers, age 23.	Mar. 12, 1864.	Axe wound of right knee joint.	April 24, 1864.	Lateral flap amputation upper third thigh. Surg. E. Bentley, U. S. V.	Died May 1, 1864, of pyæmia. *Specs.* 2234, 2253, A.M.M. CASE 529, p. 363, *ante*.
132	Robinson, S., Pt., C, 15th Pennsylvania Cav., age 22.	Nov. —, 1864.	Necrosis of tibia from a bruise; periosteal inflam. Jan. 13, 1865, portion of tibia removed.	Jan. 23, 1865.	Circular amputation at lower third of right thigh. Ass't Surg. J. C. Thorpe, U. S. V.	Died February 13, 1865, from exhaustion.
133	Rose, J., Pt., B, 119th Illinois, age 35.	——— 1864.	Simple fracture of lower third of right tibia; gangrene.	Sept. 5, 1864.	Circ. amp. at lower third thigh. Surg. J. F. Randolph, U. S. A.	Died September 7, 1864.

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
134	Searle, T. E., Lieut., G, 1st New York Artillery.	Oct. 31, 1864.	A 32-pounder gun crushed right thigh.	Oct. 31, 1864.	Amputation at upper third of thigh.	Died November 1, 1864.
135	Smith, M. V., Pt., A, 11th West Virginia, age 24.	Sept. 19, 1864.	Contusion of left knee joint and fracture of patella; fall from a horse.	Nov. 7, 1864.	Amp. middle third thigh by lat. oval skin flaps, circ. sec. musc. A. A. Surg. J. Neff.	Died December 4, 1864, of exhaustion.
136	Smith, O. F., Serg't, F, 69th Ohio, age 28.	June 11, 1865.	Comp'd comm. fract. heads of right tibia and fibula and obl. fract. of int. condyle of femur; r't hand injured; railr'd accid.	June 11, 1865.	Antero-posterior flap amp. of right thigh by transfixion.	Died June 30, 1865, of pyæmia.
137	Storey, R. G., Pt., K, 95th Illinois, age 44.	Dec. 19, 1864.	Comp'd comminuted fract. of right leg; railroad accident.	Dec. 19, 1864.	Flap amp. at lower third thigh. Surg. S. E. Fuller, U. S. V.	Died December 20, 1864, of shock.
138	Strouse, A., Pt., G, 174th Ohio, age 20.	———	Abscess of right thigh; gangrene.	Feb. 6, 1865.	Amputation at middle third of thigh.	Died Feb. 16, 1865, of pyæmia.
139	Swift, R. B., Pt., H, 1st Michigan, age 23.	Nov. 24, 1863.	Axe wound of right knee joint; sloughing; joint extensively opened.	Jan. 5, 1864.	Circular amputat'n at junction of lower thirds. Surg. S. D. Turney, U. S. V.	Died January 7, 1864, of exhaustion. CASE 527, p. 362, *ante*.
140	Taylor, T., Pt., D, 5th Pennsylvania Res., age 36.	——— 1864.	Contusion left foot, fracture os calcis, and injury of ank. joint by a fall; gangrene.	May 13, 1864.	Antero-posterior flap amputation of thigh. A. A. Surg. F. F. Maury.	Died May 13, 1864, from shock.
141	Thomas, J. L., Pt., E, 12th Missouri, age 25.	Nov. 1, 1864.	Fract. left leg, rupture femoral artery; limb tumefied; railroad accident.	Nov. 3, 1864.	Flap amputation at junction of middle and lower thirds.	Died November 3, 1864, of exhaustion.
142	Tinkler, F., Pt., A, 18th Illinois.	———	Accidental injury.....	———	Amputation of left thigh	Died July 9, 1863.
143	Towne, W. H., Pt., A, 18th Connecticut, age 30.	Nov. 17, 1863.	Right ankle crushed by railr'd accident. Nov. 18, 1863, amp. leg; necrosis of tibia.	Mar. 8, 1864.	Lateral flap amputation lower third of thigh. Surg. H. W. Owings, 2d E. S. Maryland.	Secondary hæmorrage from femoral artery. Died March 28, 1864, of hæmorrhage.
144	Turner, R. H., Corp'l, E, 1st Maryland, age 23.	Oct. 3, 1864.	Incised w'nd, adze penetrating left knee joint.	Oct. 18, 1864.	Circular amp. at middle third of thigh. Ass't Surg. R. F. Weir, U. S. A.	Died October 24, 1864, of pyæmia. CASE 528, p. 363, *ante*.
145	Urban, H., Serg't, F, 20th Massachusetts, age 22.	Feb. —, 1864.	Chronic ulcers of left leg; gangrene; flaps sloughed and condyles protruded.	Jan. 4, 1865.	Circular amputation at middle third of thigh. A. A. Surg. J. C. Morton.	(Dec. 25, '64, amp. at knee.) Jan. 6, '65, hæm.; lig. femoral artery. Died Jan. 7, '65; hæmorrhage.
146	Vigor, J. H., Pt., D, 175th Ohio, age 18.	Oct. 13, 1864.	Comp'd comm. fract. right tibia, fibula, and femur; knee joint involved; railroad accident.	Oct. 13, 1864.	Circular amputation at upper third of thigh. Surg. J. C. Whitehill, U. S. V.	Died October 14, 1864, of shock.
147	Walton, J., Pt., C, 72d Ohio, age 43.	April 7, 1864.	Compound fracture right ankle joint; railroad accident; erysipelas.	April 26, 1864.	Lateral flap amputation lower third of thigh. Surg. J. R. McClurg, U. S. V.	Died May 12, 1864, of pyæmia.
148	Wilkins, R., Pt., B, 8th Iowa, age 24.	Oct. 20, 1863.	Right leg crushed; railroad accident; gangrene involving knee joint.	Nov. 9, 1863.	Flap amputation at upper third of thigh. A. A. Surgeon D. Cummins.	Died January 24, 1865, of chronic diarrhœa and bronchitis.
149	Wilson, T., Pt., C, 7th Vet. Reserve Corps, age 41.	———	Contusion of leg: ant. surface a black slough from ankle to knee; ant. tibial art. involved.	Dec. 25, 1863.	Flap amputation at lower third of thigh. A. A. Surg. J. C. Marr.	Varioloid and pleuro-pneumonia. Died March 13, 1864, of pneumonia.

Exarticulations at the Knee Joint.—Four amputations at the knee joint for miscellaneous causes were reported; two proved successful, two fatal. In one instance amputation in the thigh was subsequently performed:

CASES 1000–1003.—Private G. Brown, E, 34th Illinois, aged 54, had his right leg crushed in a railroad accident, September 24, 1864; circular amputation at the knee joint was performed on the same day, the condyles of the femur being sawn off; gangrene appeared but was checked by the application of bromine; the patient recovered.—Private H. Gertjahr, D, 82d Pennsylvania, aged 45, had the left leg removed at the knee joint by Surgeon E. Bentley, U. S. V., on March 7, 1865, for necrosis of the middle third of the left tibia. He was discharged the service June 4, 1865.—Sergeant J. Shearer, A, 11th Maryland, aged 28, received, on May 20, 1865, several kicks from a horse which caused compound comminuted fractures of both legs; excessive hæmorrhage followed. On May 21st the left leg was amputated through the knee joint, retaining the patella and condyles of femur; the right leg was removed at the upper third by the antero-posterior flap method; Assistant Surgeon G. M. McGill, U. S. A., performed both operations. The patient died May 22, 1865.—Sergeant H. Urban, F, 20th Massachusetts, aged 22, suffered from chronic ulcers of the left leg; gangrene set in and the lower part of the tibia became exposed and necrosed. Acting Assistant Surgeon J. H. Parkard, on December 25, 1864, amputated the limb at the knee joint, removing the patella; the flaps sloughed and the condyles protruded, and on January 4, 1865, circular amputation of the thigh at the middle third was performed by Acting Assistant Surgeon J. C. Morton; hæmorrhage subsequently occurred, and on January 6th the femoral artery was ligated in continuity. The patient died on January 7th, of recurring hæmorrhage.

Amputations in the Leg.—Of two hundred and fifty-nine amputations in the leg the results were determined in all but one case; one hundred and eighty were followed by recovery and seventy-eight by death, a mortality rate of 30.2 per cent. One hundred and forty-seven were for fractures, forty-four for frostbites, seventeen for gangrene, and the remainder for various accidents and diseases.

CASE 1004.—*Amputation in the leg.*—Private C. O. F. Clark, Co. G, 1st Oregon, aged 35 years, was frost-bitten in his feet and hands while on march between Owyhee and Malheur rivers, Idaho, December 17, 1865. He was conveyed to Camp Auburn, where portions of the lower limbs were amputated by Acting Assistant Surgeon M. V. Amen on January 17, 1866. The patient recovered, and was mustered out of service April 14, 1866, and pensioned. Having been sent East, after receiving his discharge from service, for the purpose of being provided with artificial limbs, he was admitted to the Post Hospital at Washington on February 2,

1867, whence Assistant Surgeon W. Thomson, U. S. A., described the case as follows: "The operation seems to have been Chopart's, on the right foot, which had entirely healed when the patient was admitted. The stump was firm and well formed, but so sensitive for the space of one and a half inches from the cicatrix that the man desired the limb to be removed at a point above the ankle. The amputation of the left leg had been performed about six inches above the ankle and had failed to close from the presence of a ligature. After this was removed the stump healed entirely. The patient had also lost portions of the phalanges of both hands from the same cause. On May 22, 1867, he was furnished transportation to New York City to be fitted with artificial limbs." These were supplied by the firm of Monroe and Gardiner. Re-amputation of the stump of the left leg subsequently became necessary and was performed by Professor F. H. Hamilton, at Bellevue Hospital, on November 9, 1868. Several years later, when the pensioner was supplied with artificial limbs by D. W. Kolbe, of Philadelphia, both stumps were reported as being in a sound condition. The pensioner was paid December 4, 1881. Casts of the stump of the foot and of the leg were prepared at the Army Medical Museum, and constitute specimens 4128 and 4191, respectively, of the *Surgical Section*. The latter is represented in the annexed wood-cut (FIG. 371) and apparently shows the amputation to have been performed by the posterior flap-method.[1]

FIG. 371.—Stump after posterior flap amputation of leg. *Spec.* 4191.

TABLE CXI.

Condensed Summary of Two Hundred and Fifty-nine Amputations in the Leg for Disease or Miscellaneous Injuries.

[Recoveries, 1—180; Deaths, 181—258; Result undetermined, 259.]

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	Aylesworth, F. P., Serg't, E, 5th Vermont.	Oct. —, 1861.	Typhoid fever, resulting in hospital gangrene.	Jan. 4, 1862.	Amp. right leg, middle third, circular, and all toes left foot.	Discharged February 27, 1862.
2	Baker, C. R., Pt., E, 11th Massachusetts.	May —, J'ne, '64.	Scrofulous ulcers from chafing of boot during marching.	Dec. —, 1866.	Amp. left leg, lower third, flap. Dr. J. H. Bigelow, of Boston.	Discharged April 18, 1865.
3	Banks, A. M., Pt., H, 13th Pennsylvania, age 32.	——— 1861.	Running sores of legs, the result of fever; necrosis of both tibiæ.	June 3, 1869.	Amp. left leg, upper third. Dr. J. W. King, Covington, Ky.	Must'd out Aug. 6, 1861. Stump healed; right leg improved after amputation of left.
4 & 5	Bates, C., Corp'l, E, 20th Maine, age 31.	Jan. —, 1865.	Frostbite and gangrene in both feet, contracted in rebel prison.	April 25, 1865.	Amp. both legs, lower thirds, antero-posterior flap. A. A. Surg. A. J. Smith.	Discharged Oct. 21, 1865; sound stumps.
6	Bell, W. H., Pt., D, 33d Kentucky.	July 20, 1863.	Comp'd fracture lower third by wagon wheel; severe injury to ankle joint; mortification.	Aug. 8, 1863.	Amput'n right leg, upper third, flap. Dr. Moore, Greensburg, Kentucky.	Discharged December 15, 1863.
7	Best, R., Pt., D, 1st N. Y. Mounted Rifles, age 41.	Dec. 1, 1864.	Disorganization of right foot and ankle joint from burn.	May 1, 1865.	Amp. right leg, upper third, bilateral flap. A. A. Surg. L. McLean.	Discharged October 14, 1865.
8	Bishop, R., Government employé, age 28.	Aug. 17, 1864.	Right ankle joint crushed by railroad accident.	Aug. 17, 1864.	Amput'n right leg, lower third, posterior flap. Surg. J. L. Roe, 137th Indiana.	Recovered September 25, 1864; stump entirely healed.
9	Bond, J., Pt., A, 149th Illinois, age 20.	Feb. 26, 1865.	Right leg crushed by railroad accident.	Feb. 26, 1865.	Amp. right leg, middle third, circular. Surg. J. H. Phillips, U. S. V.	Discharged July 25, 1865.
10	Bond, J., Pt., K, 150th Illinois.	May 5, 1865.	Right leg injured by railroad accident.	———	Amputation right leg, middle third.	Discharged July 25, 1865.
11	Boon, N., Pt., E, 2d Colored Cavalry.	———	Scrofulous disease, involving bones of right leg.	Dec. 11, 1865.	Amp. right leg, junction upper and mid. thirds. A. A. Surg. A. McLetchie.	Discharged July 14, 1866; sore stump.
12	Bouchsein, T. E., Pt., A, 68th New York.	May 2, 1864.	Com. fracture of left foot and ankle joint by railroad accid't.	May 3, 1864.	Amp. left leg, upper third, flap. Surg. L. Schultz, 68th N. Y.	Discharged October 12, 1864.
13	Branson, D. A., Pt., C, 73d Illinois, age 25.	Mar. —, 1865.	Erysipelas, gang., abscesses, and diseased bone from abrasion of foot.	Jan. 10, 1866.	Amp. right leg, lower third, post. flap. Dr. R. H. Buck, late surgeon 13th Ind. Cav.	Discharged July 19, 1865; stump healed.
14	Brazier, J., unassigned Recruit, Vet. Vols., age 22.	Mar. 28, 1865.	Injury to right leg by railroad accident.	Mar. 28, 1865.	Amp. right leg, middle third, flap. Dr. W. W. Rutherford, Harrisburg, Penn.	Discharged July 19, 1865.
15	Brockway, M., Pt, I, 47th Ohio.	June 22, 1863.	Comminuted fracture right leg by falling tree.	June 22, 1863.	Amp. right leg, middle third. Surg. S. P. Bonner, 47th Ohio.	Discharged May 8, 1864.
16	Brown, A. R., Pt., D, 3d Vermont, age 20.	Dec. 5, 1863.	Opening in right ankle joint and ill-conditioned leg from a misstep.	Jan. 3, 1866.	Amp. right leg, junct. middle and lower thirds, circ. Dr. L. Richmond, Derby, Vermont.	Must'd out July 27, 1865; stump healed. Died April 10, 1867.
17	Brown, C., Pt., H, 9th Missouri.	April 15, 1865.	Left leg fractured by railroad accident.	April 15, 1865.	Amputation left leg, upper third, flap.	Discharged November 17, 1865.
18	Brown, C. E., Pt., G, 1st Massachusetts Heavy Artillery, age 22.	Jan. 3, 1865.	Frostbite of left foot followed by ulceration.	Mar. 15, 1865.	Amp. left leg, lateral skin flaps and circular section muscles. A. A. Surg. B. B. Miles.	Discharged May 16, 1865.
19	Brown, R., Pt., G, 31st Ohio.	Feb. 1, 1864.	Left leg crushed by railroad accident.	Feb. 1, 1864.	Amp. left leg, upper third, ant. posterior flap.	Discharged September 24, 1864.
20	Buckner, A. J., Pt., E, 4th Iowa Cavalry, age 27.	July 19, 1864.	Axe wound, fract'g phalanges and met. bones 3d toe, r't foot; ulceration and sloughing.	Dec. 10, 1864.	Amp. right leg, lower third, flap. Surg. M. K. Taylor, U. S. V.	Discharged August 7, 1865.
21	Burns, J., Pt., A, 17th New York, age 21.	June 20, 1865.	Comp'd fract. right foot with great destruction of soft parts, and comp. fracture left thigh, mid. third, by railr'd accid't.	June 20, 1865.	Amp. right leg, lower third, circular, and left thigh in upper third. A. A. Surg. R. P. Johnson.	Discharged November 14, 1865.
22	Burns, J., Pt., G, 20th Penn. Cavalry, age 18.	Jan. 28, 1864.	Right leg injured by railroad accident.	Jan. 28, 1864.	Amputation right leg, upper third, flap.	Discharged.
23	Callaway, A. R., Pt., A, 115th Illinois, age 22.	Sept. 9, 1863.	Fracture of left leg above ankle by railroad accident.	Sept. 9, 1863.	Amp. left leg, upper third, flap. Ass't Surg. J. A. Jones, 115th Illinois.	Discharged March 25, 1865.
24	Carson, E., Pt., 1st Kentucky Battery.	Sept. 12, 1862.	Right leg crushed by cannon wheel.	Sept. 12, 1862.	Amp. right leg, flap, mid. third. Ass't Surg. R. F. Weir, U. S. A.	Discharged December 2, 1862.

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
25	Caton, G. W., Pt., M, 2d E. Tennessee Cavalry.	July 25, 1863.	Left foot and ankle crushed by railroad cars.	July 25, 1863.	Amp. left leg 3 inches above ankle, circular. Surg. W. Hobbs, 85th Indiana.	Gangrene. Discharged April 24, 1865.
26	Christofferson, J., Pt., E, 10th Veteran Reserve Corps.	July 10, 1864.	Left leg torn off and left thigh fractured by railroad accid't.	July 11, 1864.	Amp. left leg, upper third, circ. Dr. J. Evans, Havre-de-Grace, Maryland.	Discharged.
27	Clark, C. O. F., Pt., G, 1st Oregon.	Dec. 17, 1865.	Frostbite of both feet	Jan. 17, 1866.	Amp. left leg, mid. third, and right foot. A. A. Surg. M. V. Aman. Nov. 9, 1868, re-amp. in upper third.	Disch'd April 14, 1866. 1870, sound stumps. *Specs.* 4128 and 4191, A. M. M.
28	Clark, T. W., Chaplain, 99th New York, age 42.	May 10, 1862.	Injury of left 2d toe, resulting in painful deformity and partial dislocation.	Jan. 21, 1863.	Amputation left leg, low. third, flap.	Disch'd Feb. 11, 1863. (Nov. 26, 1862, amp. left 2d toe.) Feb. 7, 1872, amp. thigh, lower third: recovered.
29	Collins, P., Pt., I, 29th Indiana, age 28.	July 2, 1865.	Left leg injured by railroad accident.	July 2, 1865.	Amp. left leg, low. third. Surg. F. B. Kimball, 3d N. H.	Recovered Aug. 13, 1865. (Discharged soldier.)
30	Conn, S., Pt., G, 18th Missouri, age 22.	Jan. 17, 1862.	Comp'd fracture left leg by a fall from a wagon.	Feb. 1, 1862.	Amput'n left leg, middle third. Surg. W. Varian, U. S. V.	Discharged April 10, 1862.
31	Connell, J., Pt., A, 51st Illinois, age 35.	Oct. 31, 1864.	Left leg injured by railroad accident.	Oct. 31, 1864.	Amp. left leg, mid. third, flap. Dr. J. Northrup, Woodstock, Illinois.	Discharged Mar. 23, 1865. (Also wound right thigh.)
32	Crane, H., Pt., E, 89th Illinois, age 30.	Jan. 16, 1864.	Axe wound of right foot: erysipelas; necro. of tarsal bones.	Mar. 5, 1864.	Amput'n right leg, lower third, antero-post. skin flap. Surg. H. T. Legler, U. S. V.	Discharged June 14, 1864.
33 34	Cummins, J. W., Pt., L, 5th Michigan Cavalry, age 22.	Feb. —, 1865.	Slough'g and unhealthy condition of stumps following amp. of both feet at ank. j't on acc. of scurvy contracted in prison.	May 10, 1865.	Amputation of both legs, lower thirds, flap. A. A. Surg. E. Seyffarth.	Discharged Aug. 2, 1865. (Feb., 1865, amputation both feet at ankle joint.)
35 36	Dougherty, B. T., Pt., K, 31st Illinois, age 22.	———	Gangrene of both feet following frostbite while prisoner of war.	April 17, 1865.	Amp. both legs, lower thirds, circular. A. A. Surg. F. E. Martindale.	Discharged October 13, 1865.
37	Davis, J., Pt., B, 31st Wisconsin.	Mar. 2, 1863.	Left leg injured by railroad accident.	Mar. 2, 1863.	Amput'n left leg, upper third.	Discharged August 29, 1863.
38 39	Dees, G. W., Pt., E, 13th Missouri Cavalry, age 23.	Dec. 13, 1865.	Frostbite of both legs.....	Dec. 16, 18, 1865.	Amp. both legs, lower thirds. Ass't Surg. D. G. Wilson, 1st Michigan Cavalry.	Discharged June 2, 1866.
40	DeLong, R. L., Pt., B, 5th Vermont, age 20.	Mar. 24, 1864.	Comp'd fract. both bones right leg by railroad accident.	Mar. 24, 1864.	Amp. right leg, junct. middle and lower thirds, flap.	Discharged November 4, 1865.
41	Dennis, F., Pt., K, 98th Illinois.	Sept. 8, 1862.	Left leg injured by railroad accident.	Sept. 8, 1862.	Amput'n left leg, upper third.	Discharged July 30, 1863.
42 43	Devine, P., citizen, age 17...	Sept. 14, 1863.	Comp'd comminuted fracture of bones of both legs.	Sept. 14, 1863.	Circ. amp. both legs, low. th'ds. A. A. Surg. T. H. Stillwell.	Gangrene. Recovered June 24, 1864. *Spec.* 1844. A. M. M.
44	Doherty, E., Pt., D, 9th Massachusetts, age 40.	Feb. 9, 1864.	Comp'd com. fracture of bones right leg by kick of a mule.	Feb. 24, 1864.	Amput'n right leg, upper third. Surg. J. F. Sullivan, 9th Mass.	Mustered out June 21, 1864.

221	Kries, F., Pt., H, 1st Missouri State Militia, age 41.	Jan. 6, 1864.	Frostbite of left foot.....	Jan. 12, 1864.	Circ. amp. leg 4 inches above ankle. A. A. Surg. L. H. Callaway.	Died January 18, 1864, of tetanus.
222	Lahay, J., Pt., K, 46th Illinois, age 16.	Feb. 2, 1865.	Right leg injured by railroad accident.	Feb. 2, 1865.	Amputation of right leg.....	Gangrene. Died Feb. 19, 1865.
223	Lee, L., Pt., A, 12th Colored Troops, age 19.	———	Dry gangrene both legs.....	Nov. 25, 1864.	Circ. amp. both legs, up. third. A. A. Surg. J. S. Giltner.	Died Jan. 13, 1865, of gangrene.
224						
225	Lovell, L., Pt., —, 1st Mich. Lt. Artillery, age 52.	———	Necrosis of right tibia; gang. caused by injudicious appli'n of tourniquet to suppress hæm.	Sept. 25, 1864.	Flap amp. of right leg below tuberosity of tibia. Surg. S. D. Turney, U. S. V.	Died September 26, 1864, of exhaustion.
226	Loyd, E., Pt., E, 2d Maryland, age 25.	———	Idiopathic phlegmonous erysipelas of right foot.	Dec. 28, 1864.	Amputation of leg, lower third. Surg. D. W. Bliss, U. S. V.	Gangrene; tetanus. Died February 3, 1865.
227	McAllister, J., Pt., I, 3d Illinois Cavalry.	May 20, 1863.	Fract. of right leg and os calcis of both feet by a fall.	May 21, 1863.	Amp. right leg, mid third, and Syme's amput'n at left ankle.	Chronic bronchitis. Died May 23, 1863.
228	McElroy, D., —, age 27.....	June 19, 1862.	Comm'n met. bones right foot; gangrene; railroad accident.	June 24, 1862.	Lat. skin flap amp. leg. Dr. T. M. Markoe, New York.	Diarrhœa. Died Aug. 28, 1862.
229	McQuaid, R. D., Lieut., K, 29th Michigan, age 30.	Jan. 11, 1865.	Comp'd com. fract. right tibia, upper third, with dislocation.	Jan. 11, 1865.	Flap amput'n leg, upper third. Surg. J. E. Herbst, U. S. V.	Died Jan. 19, 1865, of exhaustion.
230	Marks, J. H., Pt., G, 6th Pennsylvania Cavalry.	Dec. 24, 1862.	Compound fracture left leg by wagon wheel.	———	Amputation of leg.....	Died January 6, 1863.
231	*May, W. A.*, Pt., H, 7th N. Carolina, age 23.	Oct. 17, 1864.	Compound com. fracture left leg by railroad accident.	Oct. 18, 1864.	Circ. amp. of leg, upper third. Surg. W. D. Baylor, C. S. A.	Sloughing. Died Oct. 25, 1864.
232	Meador, F., Pt., K, 26th Colored Troops, age 40.	Mar. 18, 1864.	Frostbite left foot and two middle toes right foot.	April 16, 1864.	Amp. left leg, junct. up. thirds, and 2d middle toes, right foot. A. A. Surg. E. DeWitt.	Died June 23, 1864, of pyæmia.
233	Miller, D., Pt., 145th New York.	Oct. 17, 1862.	Right foot fractured by railroad accident.	Oct. 19, 1862.	Amputation of leg, lower third.	Died October 24, 1862. *Spec.* 781, A. M. M.
234	Mulhatlan, P., Pt., B, 150th Pennsylvania.	Oct. 8, 1864.	Both legs crushed by railroad accident.	Oct. 8, 1864.	Doub. flap amp. left leg, junct. up. thirds, and right leg just below tub. of tibia, skin flap and circ. sect. of muse Ass't Surg. H. S. Schell, U. S. A.	Died October 8, 1864, of shock and loss of blood.
235						
236	Murphy, E., Pt., D, 143d N. York, age 21.	Oct. 12, 1862.	Right tarsal bones comminuted in attempt to jump from railway car; gangrene.	Oct. 17, 1862.	Lateral flap amp. leg at middle third. Dr. G. A. Peters, New York City Hospital.	Gangrene; diarrhœa. Died December 1, 1862.
237	Newton, O., Pt., K, 10th N. York Hvy Art., age 40.	———	Erysip. inflam. of right leg and foot, resulting in gangrene.	July 15, 1864.	Circ. amp. of leg, lower third. A. A. Surg. A. Van Cortlandt.	Died Aug. 24, 1864, of dysentery.
238	Pale, J. H. N., Pt., C, 97th Illinois, age 36.	Nov. 1, 1863.	Compound fracture right leg, mid. third, by railroad accid't.	Nov. 16, 1863.	Flap amputation of leg, upper third. Surg. F. Bacon, U.S.V.	Nov. 18, hæm.; lig. post. tib. art. on face of stump. Died Nov. 25, 1863, of pyæmia.
239	Rudge, L. H., Corp'l, H, 1st New York Artillery.	July —, 1863.	Both legs injured by railroad accident.	———	Amputation of both legs.....	Died July 17, 1863.
240						
241	Sanders, B., Corp'l, 3d Md. Battery, age 37.	———	Mortification of both legs to junction of middle and lower thirds.	Feb. 16, 1865.	Amput'n through middle third, both legs. Surg. B. B. Breed, U. S. V., and A. A. Surg. L. Sinclair.	Died March 12, 1865. (May 13, 1864, shot fracture upper third femur.)
242						
243	Shearer, J., Serg't, A, 11th Maryland, age 28.	May 20, 1865.	Comp'd com. fracture middle third right leg, and double compound fracture left leg in middle and upper thirds, by horse kicks.	May 21, 1865.	Ant. post. skin flap amp. right leg and amp. thro' left knee joint, leaving patella and condyles, by Ass't Surg. G. M. McGill, U. S. A.	Feeble reaction after prolonged primary shock. Died May 22, 1865.
244	Sligh, J. W., Capt., F, 1st Michigan Engineers.	Oct. 23, 1863.	Com. fractur right leg and simple fracture left leg by railroad accident.	Nov. —, 1863.	Amp. right leg 4 inches below knee. Surg. B. Woodward, 22d Illinois.	Died November 15, 1863. *Spec.* 2077, A. M. M.
245	Smith, J., Lieut., I, 65th Ohio.	June 2, 1865.	Comp'd com. fracture left ankle joint and injury of spine.	June 2, 1865.	Amputat'n of leg, lower third. Surg. E. B. Glick, 40th Ind.	Acute meningitis. Died June 10, 1865.
246	*Smith, W. W.*, Pt., I, 17th Alabama, age 19.	Dec. 1, 1864.	Frostbite of toes of both feet; mortification of parts.	Mar. 9, 1865.	Flap amputation right leg in middle third. Ass't Surg. J. C. Thorpe, U. S. V.	(Feb. 11, 1865, 1st 4 toes right foot and 1st 3 toes left foot amput'd.) Died June 16, 1865, of exhaus.
247	Sorter, J. D., Pt., E, 16th Vet. Res. Corps, age 21.	———	Abscess of foot; gangrene and repeated hæmorrhage.	July 18, 1864.	Oval flap amp. of leg, lower third. A. A. Surg. W. C. Wey.	Gangrene. Died Aug. 11, 1864.
248	Thirlway, J., Pt., I, 69th N. York, age 18.	Dec. 26, 1864.	Frostbite of right foot; gang..	Feb. 17, 1865.	Circ. amp. of leg, lower third. A. A. Surg. C. F. Trautman.	Died February 25, 1865, of exhaustion.

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
249	Thompson, J. W., Pt., A, 5th Colored Troops, age 22.	Jan. —, 1864.	Frostbite of feet; gangrene ...	Feb. 17, 1864.	Amp. left leg, lower third, semi-circ. method above, flap from below. A. A. Surg. B. T. Crooker.	Died February 20, 1864, of exhaustion.
250	Towne, W. H., Pt., A. 18th Conn., age 30.	Nov. 17, 1863.	Comp'd com. fract. right ankle; crushed by railroad cars.	Nov. 18, 1863.	Flap amputat'n lower third leg. Surg. H. W. Owings, 2d E. S. Maryland Vols.	March 8, 1864, amp. lower third thigh. Died March 28, 1864, of secondary hæmorrhage.
251 } 252 }	Weber, J., Pt., E, 7th New York, age 60.	Jan. —, 1865.	Frostbite of both feet; tetanus.	Feb. 10, 1865.	Amp. both legs, lower third, with lateral closure of stumps. Ass't Surg. H. Allen, U. S. A.	Died February 11, 1865.
253	Westfall, L., Pt., M, 24th N. York Cavalry, age 17.	———	Gangrenous ulcer on low. third left leg, exposing tibia.	Jan. 19, 1865.	Circ. flap amp. of leg, mid. third. Surg. R. B. Bontecou, U. S. V.	Died February 11, 1865, of exhaustion.
254	Wilmot, W., Musician, E, 14th Illinois Cav'ry, age 51.	———	Gangrene of right foot to ankle and of toes of left foot, from exposure.	Feb. 8, 1865.	Ant. post. flap amp. right leg, lower third, and all toes of left foot. Ass't Surg. W. S. Tremaine, U. S. V.	Died March 11, 1865, of exhaustion.
255 } 256 }	Wood, W., Pt., A, 102d N. York.	Sept. 14, 1864.	Both legs injured by railroad accident.	Prim'ry.	Amp. of both legs, mid. third. A. A. Surg. C. C. Lee and Dr. W. C. Way, of Elmira.	Died September 17, 1864.
257	Woody, B. C., Pt., E, 14th Penn. Cavalry, age 18.	July 15, 1864.	Right leg crushed from ankle to middle by railroad accid't.	July 15, 1864.	Ant. post. flap amp. of leg at junct. of upper thirds. Surg. S. N. Sherman, U. S. V.	Died July 26, 1864, of traumatic gangrene.
258	Yancrum, F., Pt., E, 93d Pennsylvania, age 34.	May 10, 1864.	Fracture bones of right leg at junction of lower thirds by mule kick; gangrene.	June 13, 1865.	Amputation of leg at up. third. A. A. Surg. G. K. Smith.	Died June 27, 1865, of pyæmia. *Spec.* 4242, A. M. M.
259	*Michel*, —, Lieut., 14th La..	———	Gangrene	———	Amputation of leg.....	Result unknown.

Of fifty-one partial amputations of the foot for miscellaneous injuries or disease, forty-seven were followed by recovery and four by death:

Table CXII.

Condensed Summary of Fifty-one Partial Amputations of the Foot for Miscellaneous Injuries or Disease.

[Recoveries, 1—47; Deaths, 48—51.]

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
1 } 2 }	Bamer, J., Pt., G, 178th New York.	———	Frostbite of both feet.....	———	Partial amputat'n of both feet.	Discharged Oct. 16, 1865; feet blue and cold.
3	Barnhart, M., Pt., H, 50th Pennsylvania, age 28.	——— 1864.	Left foot frozen; slough. of toes. Nov. 22, '64, amp. of toes; necrosis of met. bone of great toe.	Mar. 27, 1865.	Amputation great toe and metatarsal bone. Surg. G. L. Pancoast, U. S. V.	Discharged Aug. 10, 1865. Amp. left ring finger for shot fracture.
4	Bickel, J., Pt., H, 22d Ohio.	Sept. 15, 1864.	Injury of left foot; railroad accident.	Sept. 15, 1864.	Chopart's amputation left foot.	Discharged Nov. 15, 1864; stump remaining sore.
5 } 6 }	Butler, J. R., Pt., H, 10th Kansas, age 18.	Jan. 7, 1864.	Feet frozen; toes slough'd from left foot except 5th and one phalanx of 4th.	Mar. 20, 1864.	Amp. 1st, 2d, and part 3d met. bones left foot, and great toe and head met. bones right foot. Surg. A. C. Van Duyn, U. S. V.	Discharged March 7, 1865.
7	Charles, M., Pt., B, 10th N. Jersey.	———	Frostbite both feet; gangrene. April 28, '62, Syme's amputation at left ankle joint.	May 4, 1862.	Lisfranc's amputat'n right foot. A. Surg. B. E. Fryer, U. S. A.	Discharged August 11, 1862.
8	Clark, C. O. F., Pt., G, 1st Oregon.	Dec. 17, 1865.	Frostbite both feet.....	Jan. 17, 1866.	Chopart's amp. right foot and amp. left leg at middle third. A. A. Surg. M. V. Amen.	Disch'd April 14, '66. Nov. 9, '68, re-amp. left leg. 1870, stump sound. *Specs.* 4198, 4191, A. M. M.
9	Conklin, J., Pt., F, 1st Ohio Cavalry, age 18.	July 10, 1864.	Fract. of metatarsal bones of right foot; railroad accident.	———	Amputat'n through metatarsal bones, flap from sole of foot.	Discharged March 25, 1865.
10	Corcoran, C., Pt., G, 1st Massachusetts, age 22.	Nov. 13, 1864.	Phalanges of great toe cut by an axe; necrosis.	Feb. 14, 1865.	Oval amp. of great toe and met. bone. A. A. Surg. J. Murray.	Mustered out June 27, 1865; doing well.
11	Counter, O. R., Pt., —, 4th New Hampshire.	Feb. 10, 1865.	Frozen feet	Mar. 4, 1865.	Amp. left foot thro' met. bones and of right fifth toe.	Discharged July 11, 1865.
12	Dennison, C. W., Pt., B, 2d Rhode Island, age 18.	Dec. —, 1863.	Frostbite of both feet; loss of all toes. Sept., 1864, left foot contused.	Sept. 17, 1864.	Disarticulation of met. bones of left foot. Surg. St. J. W. Mintzer, U. S. V.	Discharged July 5, 1865.
13 } 14 }	Downey, J., Pt., B, 12th Illinois Cavalry, age 34.	Jan. 1, 1864.	Severe frostbite both feet; caries of metatarsal bones.	April 15, 1864.	Amp. of both feet thro' tarso-metatar. articulation. A. A. Surg. R. N. Isham.	Discharged June 20, 1864; good stump.
15	Dukes, J. R., Serg't, E, 87th Indiana.	Nov. 1, 1862.	Axe cut of left foot	Feb. —, 1863.	Chopart's amput'n of left foot. A. A. Surg. P. Rectanus.	Discharged February 15, 1863.
16 } 17 }	Fletcher, J., Pt., D, 1st Colored Troops, age 25.	Dec. —, 1863.	Freezing of both feet; gangrene.	Jan. 22, 1864.	Amp. both feet thro' met. bones. A. A. Surg. C. B. Fry.	Discharged February 7, 1865.
18	Gardner, J., Pt., F, 65th Indiana.	April 2, 1864.	Laceration of left tarsus and fracture of metatarsus; railroad accident.	June 5, 1864.	Modification of Chopart's amp.; the proximate half scaphoid bone allowed to remain. A. A. Surg. J. G. Harvey.	Mustered out June 22, 1865, with excellent stump.
19 } 20 }	Harris, T., Pt., C, 27th Colored Troops, age 25.	Oct. —, 1864.	Gangrene both feet from wear'g tight shoes; toes dry and hard.	Jan. 19, 1865.	Amp. at tarso-met. articulat'n. Surg. E. Bentley, U. S. V.	Discharged September 2, 1865; ends of bone well covered.
21	Hawkins, E., Pt., B, 9th Indiana, age 21.	Mar. 17, 1865.	Com. met. bones and lac. soft parts left foot; railr'd accid't.	Mar. 17, 1865.	Amputation at tarso-metatarsal articulation.	Mustered out September 28, 1865.
22 } 23 }	Hayes, J. S., Pt., I, 21st N. Jersey.	Jan. —, 1863.	Frostbite of both feet; gang. and mortification.	Mar. 3, 13, '63.	Amputation of both feet thro' metatarsal bones.	One foot healed, small ulcer on the other. Discharged.
24 } 25 }	Hirsch, P., Pt., D, 98th Pennsylvania, age 38.	Jan. 1, 1864.	Both feet frozen; line of demarcation well defined.	Feb. 9, 1864.	Flap amp. right foot at mid. of metatarsus, and of toes and heads of met. bones left foot. Ass't Surg. A. Ingram, U. S. A.	Stump healed and promised to be useful. Discharged September 22, 1864.
26	Horman, W., Pt., H, 18th Kentucky, age 45.	July 21, 1864.	Comp'd com. fract. 4th and 5th metatarsal bones right foot; railroad accident.	July 21, 1864.	Circular flap amp. 4th and 5th toes at tarso-metatarsal articulation.	Transferred to Veteran Reserve Corps May 4, 1865.

No.	Name, Military Description, and Age.	Date of Injury or Disease.	Nature of Injury or Disease.	Date of Operation.	Operation and Operator.	Result and Remarks.
27	Jones, S., Pt., I, 30th Iowa, age 23.	Sept. 30, 1863.	Bone scurvy and hospital gangrene, causing loss of use of both feet.	Nov. 6, 1863.	Chopart's amp. of right foot. Surg. J. Andrews, 3d Michigan Cavalry.	Oct. 16, amp. left leg. Nov. 10, 11, hæm.; inter. plantar artery tied. Disch'd June 3, 1865.
28	Langan, J., civilian, Quartermaster's Dep't, age 25.	July 18, 1865.	Incised wound thro' metatarso-phalangeal joint left 5th toe, extending to tarsal articulat'n.	July 18, 1865.	Amp. of 5th toe at tarso-met. artic. A. A. Surg. W. Balser.	Returned to duty Aug. 27, 1865.
29	Leichley, S., Pt., I, 178th N. York, age 19.	Dec. 30, 1864.	Frostbite of left foot; necrosis.	April 30, 1865.	Flap amputation at tarso-metatarsal articulation.	Discharged February 15, 1866.

50	Tucker, A., Pt., B, 7th Indiana Cavalry.	Feb. —, 1864.	Both feet frost-bitten	Feb. —, 1864.	Amput'n of right foot at tarso-metatarsal articulation.	Died Sept. 30, 1864, of chronic diarrhœa.
51	Williams, H., Pt., B, 59th Colored Troops.	———	Frostbite of right foot; gangrene of toes.	April 2, 1864.	Circular amp. of foot through metatarsal bones.	Died August 26, 1864, of general debility.

One hundred and twenty-two amputations of the toes for miscellaneous injuries were recorded; the results in seven cases were not ascertained; one hundred and nine recovered, six died. An instance of amputation for dry gangrene is here cited:

Case 1005.—*Amputation of toes.*—Hospital Steward R. Schofield, 69th Pennsylvania, aged 49 years, had both his feet frost-bitten while with his regiment in the field near Stevensburg, January 1, 1864. Surgeon R. B. Bontecou, U. S. V., in charge of Harewood Hospital, Washington, gives the following history: "The patient was a man of temperate habits and of good constitution. The tent in which he was sleeping in the field was blown down during the night, when his feet became exposed, the other parts of his body remaining well protected. Although the weather was intensely cold, he slept well during the night, and on waking up in the morning found the forepart of both his feet frozen. He received no treatment until admitted to this hospital on February 1st. At the time of his admission the patient was found to be suffering from dry gangrene of the toes of both feet, resulting from the freezing, and extending to the metatarsal bones of the left foot, with destruction of the soft parts. The patient was in good spirits, and although he was doing well it was deemed advisable to disarticulate the toes. Nourishing diet and stimulants were administered and simple dressings were used." The amputated toes, contributed to the Museum with the description of the case by Surgeon Bontecou, constitute specimen 2163 of the *Surgical Section*, and a representation of the diseased feet appears in the adjoining wood-cut (Fig. 372). The patient was discharged from service for disability January 27, 1865, and pensioned. The Philadelphia Examining Board on November 7, 1877, certified to the pensioner's condition as follows: "He has had all the toes of the right foot amputated through the metatarso-phalangeal articulation except the little toe, which is drawn into the cicatrix. The foot is defective in circulation and there are chronic ulcers of the leg extending from the ankle to within

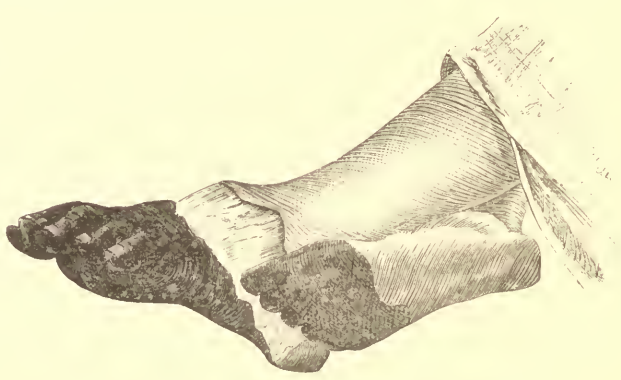

Fig. 372.—Dry gangrene of both feet after frostbite. *Spec.* 2163.

four and a half inches below the knee, being very offensive and requiring constant care and attention. This condition no doubt is due to anæsthesia of the foot and leg. The cicatrices extend around the leg and are constantly scaling. There is also varix above to a slight extent. The toes of the left foot were amputated at the tarso-metatarsal articulation, the stump showing a good horny cicatrix; hyperæsthesia of foot or stump; atrophy of leg; stump alleged to be painful during changes of weather," etc. The pensioner was paid September 4, 1881.

LIGATIONS.—Eighteen instances of ligations of the larger vessels were reported. The injuries in eight cases were incised wounds, in two punctured wounds, and in five aneurisms; in three cases the nature of the injury was not specified. Four of the operations were on arteries of the neck and trunk, four on vessels of the upper and ten on arteries of the lower extremities. Seven were fatal, viz: a ligation of the primitive carotid, of the external and common carotids, of a branch of the mesenteric, of the radial, two of the femoral with subsequent ligations of the external iliac, and one of an artery of the dorsum of the foot. Ten of the cases are here detailed:

CASE 1006.—*Amputation in the arm. Ligation of the axillary and subsequently of the subclavian artery.*—Private H. Rieman, Co. A, 12th Maine, aged 21 years, had his left arm crushed by a railroad accident near New Orleans, January 16, 1864, and suffered amputation at the middle third of the humerus. Surgeon J. B. G. Baxter, U. S. V., reported that the man was conveyed to Barracks General Hospital, where "the axillery artery was ligated, by reason of secondary hæmorrhage from the brachial artery, on January 31st. On February 7th another hæmorrhage supervened and the subclavian was ligated in the third portion, at its point of exit from behind the scalenus anticus muscle. The probable loss of blood amounted to two quarts. The subsequent treatment included tonics, stimulants, and diet as nourishing as possible. Some pyæmia did supervene, but hæmorrhage did not again recur. By February 29th the ligature had come away and the wounds were healing rapidly, the patient's appetite being good and his condition presenting every prospect of recovery. The operations were performed by Surgeon O. M. Humphrey, U. S. V." The patient was subsequently admitted to Central Park Hospital, New York City, where he was discharged from service July 31, 1865, and pensioned. Several months after receiving his discharge he was furnished with an artificial arm by the firm of M. Lincoln, of Boston. The pensioner was paid September 4, 1881. Stump in good condition.

CASE 1007.—*Ligation of primitive carotid for aneurismal tumor.*—Acting Assistant Surgeon W. P. Moon reports the following history of "Private H. Cater, Co. C, 106th New York, aged 37 years, who was admitted to Mower Hospital, Philadelphia, September 12, 1864, on account of a tumor of the neck, situated in the upper portion of the right great anterior triangle and being about an inch and a quarter in diameter. The tumor had first been noticed about a year before, growing slowly, and for two or three months the patient was subject to paroxysms resembling asthma, relief being obtained by inhalations of ether. His general health was good, but the mass was evidently encroaching upon the larynx and œsophagus latterly, and after consultation it was decided to attempt the removal of the tumor. The patient was first allowed a furlough to go home and consult his friends, after which, finding his case growing rapidly worse, he finally consented to submit to an operation. Accordingly, on December 13th, he was thoroughly etherized, and I made an incision over the centre of the tumor down to the cyst. The enveloping membrane was found to be very vascular and the tumor had the feeling of the fibroid class. While we were examining the mass, having partly enucleated it and getting down to its attachment, the patient was seized with vomiting and two superficial veins were ruptured by the retching. As soon as these were tied another seemed to give way, the retching increased, and the hæmorrhage became so profuse that we were compelled to desist from all further efforts for the time being and decided to close up the wound after ligating the open vein, hoping for a favorable termination by suppuration. For some days the case did so well that we had strong hopes of a favorable result. Drs. D. H. Agnew, E. R. Fell, and others were present at the operation, and the patient was carefully attended by Dr. Fell. Two days afterwards the case had become complicated by erysipelas, involving the chest and right side of neck, but being readily controlled by tincture of iodine externally, and tincture of chloride of iron, Dover's powder, etc., internally. On December 18th the wound had closed except at the upper and lower points of the incision, from which openings healthy pus was discharged; but there was an unpleasant odor which excited suspicion; patient's tongue white in centre, but moist. No untoward symptoms exhibited themselves until December 26th, when secondary hæmorrhage suddenly set in to the amount of some thirty ounces, being arrested by charpie and compress. After the wound was opened and a careful examination had been made by Dr. T. G. Morton and myself, we could not determine distinctly from what vessel the hæmorrhage came, owing to the altered condition of the tissues, and therefore concluded to ligate the right primitive carotid as the most likely means to prevent a recurrence of the hæmorrhage. The ligature was applied about an inch and a quarter above its origin from the innominata. The tumor was found to have nearly disappeared, and what remained consisted of a calcareous deposit attached to the thyroid cartilage—the veins covering it, with the entire cyst, having sloughed away. On the next day the patient was apparently doing well; wound dry but disposed to slough; very little pus forming. The parts were dressed with diluted chlorinate of soda. On December 29th there was partial paralysis of the left side; wound showing some disposition to clean out; pulse 108; tongue dry and coated; nausea, with some vomiting; slight delirium, with some tendency to diarrhœa, which was controlled by an enema. Wound dressed with solution of permanganate of potassa. On December 30th the patient seemed to improve—taking his cream, beef-essence, and brandy without difficulty, and having no vomiting nor diarrhœa; pulse 90; wound cleaning out. On the following morning the wound presented healthy granulations, but the patient had a rigor, followed by fever and perspiration, precursors of pyæmia. From this time a decided change for the worse became evident and the patient continued to sink until the morning of January 5, 1865, when he died. The wound was healthy at the time of death. The *post-mortem* examination revealed the ordinary condition of a pyæmic patient, and showed that pus had dissected down the sheaths of the vessels nearly to the pericardium. An organized clot was found above as well as below the ligature. The former

extended down to the point of the ligation, and the latter was found occupying the carotid to within a few lines of the innominata and extending up an inch and a half above the bifurcation. The ligature had ulcerated through the carotid."

CASE 1008.—*Ligation of brachial for aneurism.*—Corporal R. L. Phillips, Co. M, 1st Wisconsin Cavalry, aged 44 years, admitted into City Hospital, St. Louis, September 15, 1862, with an aneurism of the brachial artery, caused by a sprain; had been increasing gradually. October 2d, ligation of artery by Surgeon J. T. Hodgen, U. S. V. October 24th, coldness in hand; ligature removed. Returned to regiment November 20, 1862, quite well; aneurism nearly same size, but no pulsation.

CASE 1009.—*Ligation of brachial for incised wound.*—Private W. Stewart, Co. G, 1st Connecticut Cavalry, aged 23 years, admitted to Douglas Hospital, Washington, July 31, 1865, with an incised wound of the internal aspect of the lower third of the left arm, inflicted with a penknife. July 31st, ligation of the brachial artery (supposed) at its bifurcation in continuity by Surgeon R. B. Bontecou, U. S. V. The radial pulse was almost if not quite as full as on the right side, leading to the conclusion that either the brachial had not been tied or that the bifurcation was high up in the arm. August 6th and 8th, ligatures came away. August 25th, wound entirely healed; slight pain in forearm. Transferred to New Haven August 31, 1865.

CASE 1010.—*Ligation of femoral followed by ligation of external iliac; death.*—Private W. P. Webb, Co. H, 4th Maine, aged 21 years, was admitted to Master Street Hospital, Philadelphia, August 12, 1862, suffering from an abscess resulting from a contusion. Acting Assistant Surgeon P. B. Goddard reported that "the injury was located at the outer and anterior part of lower third of the right thigh, and was inflicted by a blow with the butt end of a musket. The abscess was followed by caries of the femur, and the patient was much debilitated when admitted, but improved until secondary hæmorrhage set in at the seat of the abscess. In order to control this Acting Assistant Surgeon D. Gilbert was obliged to ligate the femoral artery above the profunda on September 21st. The patient did well until the ligature cut through on September 25th, when from the aplastic condition of the blood no coagulation had taken place in the calibre of the vessel and violent hæmorrhage from the divided femoral artery was the consequence. This was controlled by the ligation of the external iliac below the origin of the deep epigastric by Acting Assistant Surgeon W. H. Pancoast on September 25th. The hæmorrhage, however, reappeared at the seat of the first ligation on September 30th, when Dr. Pancoast was obliged to enlarge the former incision, and finding that the lifting up of the external iliac on the groove director just below the bifurcation controlled the bleeding entirely, he ligated the artery at that point. The patient lived several days after the operation; but he could not recover from the effects of the hæmorrhages and sank away gradually till October 3, 1862, when he died. The temperature of the leg continued good after the operation."

CASE 1011.—*Ligation of femoral followed by ligation of external iliac.*—Private D. Britton, Co. C, 5th Indiana Cavalry, aged 34 years, entered hospital No. 2, at Nashville, on September 19, 1864. He was admitted on account of femoral aneurism, located in Scarpa's triangle, for which pressure had been applied, producing an extensive gangrenous slough below Poupart's ligament. Surgeon J. E. Herbst, U. S. V., who described the case, reported that he ligated the femoral artery three-fourths of an inch below Poupart's ligament on October 2d, and that hæmorrhage to the amount of forty-eight ounces occurred four days afterwards, when the external iliac artery was ligated by Acting Assistant Surgeon M. N. Benjamin. Death occurred on October 7, 1864, from exhaustion resulting from the hæmorrhage.

CASE 1012.—*Ligation of femoral artery for popliteal aneurism.*—Private J. Fleming, Co. C, 157th Pennsylvania, aged 47 years, was admitted to Cuyler Hospital, Philadelphia, June 6, 1864, with aneurism of the popliteal artery of the right leg. Assistant Surgeon H. S. Schell, U. S. A., reported that "when first seen the tumor was about the size of a duck's egg; pulsation strong and diffused; bruit loud, but thrill not very well defined. The patient kept his leg in a semi-flexed position and complained of constant pain proceeding from the tumor and ankle of the same side. Below the seat of the aneurism the limb was somewhat œdematous, dusky, and slightly pitting on pressure. He stated that he first observed the tumor some months previously, after a severe exertion in lifting heavy stones, that it gradually though slowly increased in size, and that latterly the pain in the limb had increased in intensity. According to his statement the only treatment to which he had been subjected before his admission to Cuyler Hospital consisted of the application of an ointment and of a liquid, which from his description was the tincture of iodine. Physical examination showed the heart to be perfectly healthy and there appeared to be no disposition to disease of the arteries in any other part of the body. Bearing in mind Mr. Syme's case in which coagulation and a spontaneous cure was effected by the simple application of a bandage to the limb, this plan was tried and the patient was strictly confined to his bed. No success followed this method, and forced flexions were next employed, the leg being bent upon the thigh and firmly fixed by numerous turns of a figure of eight bandage. This mode of treatment likewise proving unavailing, pressure by means of an instrument resembling Signorini's tourniquet was resorted to, but was found equally as ineffective as the means previously employed. Meanwhile the aneurism was steadily enlarging and the risk of venous obstruction became more imminent daily. It was accordingly resolved to tie the femoral artery at the lower angle of Scarpa's space, which was done in the usual manner on June 16th by Acting Assistant Surgeon J. Ashhurst, jr. Anæsthesia was induced by the use of ether, and the vessel was reached by an incision about three inches in length. The hæmorrhage during the operation scarcely exceeded a fluid drachm; pulsation ceased instantly upon the tightening of the ligature. The edges of the wound were then brought together by hare-lip pins and several points of the interrupted suture (lead wire being the material employed), after which a light dressing of dry sheet lint was applied and the entire limb below the wound was enveloped in carded cotton. The temperature of the limb was at first slightly above that of the other, but it soon became normal and remained so. When the state of anæsthesia passed off the patient complained of a burning pain in the heel and ankle. The tumor (which in a few days became hard, showing that a clot had been formed) gradually diminished in size, no recurrent pulsation taking place at any time. The wound healed almost throughout by adhesion. The application of cotton to the limb was discontinued on the fifth day; the ligature came away on the seventeenth day, and the progress of the patient afterwards to recovery was uninterrupted." The patient was subsequently transferred to Mower Hospital, whence he was discharged July 5, 1865, and pensioned. The Philadelphia Examining Board reported, December 7, 1870: "We find the aneurism entirely cured by a ligation of the right femoral artery at Scarpa's space; limb somewhat atrophied and numb; use and power of limb impeded." Several years later the same board certified that the pensioner "complains of numbness down the whole surface of the thigh and leg. There is, however, no evidence of want of

blood-supply in the leg; nor is there any atrophy of the limb. There is no pulsation in the artery below the seat of the ligation." The pensioner was paid December 4, 1879.

CASE 1013.—*Ligation of femoral artery.*—Private Jerry Hart, Co. B, 2d Kentucky, was admitted into hospital No. 9, Nashville, with an injury received in a quarrel at Shiloh, Tennessee. Femoral artery ligated. Discharged January 30, 1863.

CASE 1014.—*Ligation of superior profunda for incised wound.*—Private J. Shaw, Co. D, 4th Minnesota, aged 23 years, was admitted into Crittenden Hospital, Louisville, June 26, 1865, with an incised wound of left arm, inflicted with a knife. The superior profunda was ligated in the wound. He was mustered out July 19, 1865.

CASE 1015.—*Ligation of an artery of the foot.*—Surgeon T. H. Squire, 89th New York, reports: "Private T. P. Barrows, Co. G, 35th Massachusetts, aged 18 years, accidentally wounded by an axe, which slipped from the handle while he was using it, making a transverse cut across the dorsum of the left foot, injuring the metatarsal bones, dividing the tendons and one artery, which required a ligature. The wound has been painful, the foot is badly swelled, the wound is ugly, and, for aught I know, the boy will eventually lose his limb or life from it; now being poulticed. Died November 1, 1862."

Details of the remaining eight cases of ligation belonging to this group have already been given in the preceding chapters.[1]

OPERATIONS ON THE EYE OR ITS APPENDAGES.—Seventy-six operations for diseases or injuries of the eye were reported. They include operations on the conjunctiva, for pterygium, symblepharon, anchyloblepharon, gonorrhœal ophthalmia; on the cornea, for staphyloma and leucoma; operations on the iris and the ciliary body; operations for cataract, for strabismus, for lacrymal fistula, and, on the eyelids, for blepharitis, entropion, ectropion, etc. In seven instances the eyeball was extirpated. Brief abstracts of all the cases are given in the appended table:

TABLE CXIII.

Condensed Summary of Seventy-six Operations on the Eye or its Appendages.

No.	NAME, MILITARY DESCRIPTION, AND AGE.	INJURY OR DISEASE.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	Adams, J., Pt., B, 1st Louisiana, age 35.	1863, inflammation right iris, encephaloid tumor size of horse-chestnut.	June 8, 1863, removal of eyeball and contents of socket by knife.	Recovery in three months. Disch'd Jan. 2, 1864. Died in 1866.
2	Anderson, G. H., Pt., D, 15th Vet. Reserve Corps, age 22.	August, 1864, staphyloma involving entire cornea of right eye, result of variolous postules.	Rapidly increasing in size. Nov. 20, excision of staphyloma. Surg. J. S. Hildreth, U. S. V.	Discharged July 22, 1865; pens'd.
3	Barry, C., Pt., H, 58th Illinois, age 23.	Attachment of fold of conjunctiva to cornea, right eye; nebulous and imperfect condition left cornea, result of ophthalmia, March, 1863.	Oct. 13, 1864, flap dissected. Staphyloma involved whole cornea. Dec. 31, excision staphyloma right eye. Feb. 18, iridectomy. Surg. J. S. Hildreth, U. S. V.	Discharged April 13, 1865; pens'd. Total loss of sight of right eye; disease of left eye, resulting in almost total loss of sight.
4	Beach, J. W., citizen, age 47...	Lenticular cataract on both eyes, producing total blindness.	Oct. 19, 1864, incis'n thro' left cornea, forming semi-lunar flap; capsule of lens opened and lens extracted. A. A. Surg. F. Strube.	Eyes closed with plaster and bandage. Oct. 25, able to read with a bicornous lens. Recovery November 2, 1864.
5	Bendon, T., Serg't, D, 170th New York, age 26.	May, 1864, injury left side of head; staphyloma of left cornea.	Jan. 10, '65, removal of whole cornea; a portion of humor evacuated.	Discharged May 17, 1865; received artificial eye.
6	Blakeman, A., Pt., A, 10th Wisconsin, age 29.	November, 1863, staphyloma of left cornea.	Aug. 10, 1864, operation for staphyloma. Surg. A. Hammer, U. S. V.	Disch'd Oct. 13, 1864; loss of sight left eye, threatened loss right eye.
7	Boas, H., Pt., B, 8th Veteran Reserve Corps, age 20.	Central leucoma of left eye, result of gonorrhœal ophthalmia; vision null.	June 3, 1865, artificial pupil at upper and int. margin of cornea. Surg. J. S. Hildreth, U. S. V.	Recovery of vision of large objects. Discharged July 2, 1865.
8	Brandy, F. M., Corp'l, C, 42d Indiana, age 31.	Pterygium of right eye.....	Dec. 24, 1864. Desmarres's process. Surg. J. S. Hildreth, U. S. V.	Adherent in a few days. Disch'd August 7, 1865.
9	Brown, B. L., Pt., H, 84th Illinois, age 25.	Large pterygium of both eyes.....	March 4, 1865, Desmarres's method. Surg. J. S. Hildreth, U. S. V.	Flap united, pterygium disappeared. Disch'd April 13, 1865; pensioned.
10	Butler, H., Seaman, Gunboat Mound City, age 23.	Penetrating wound of left eyeball; large protrusion of humor.	Sept. 15, 1862, extirpation of ball of eye. Surg. E. C. Franklin, U. S. V.	Duty Dec. 7, 1862; pens'd. "Sympathetic affection of right eye."
11	Callaghan, J., Pt., C, 45th Illinois, age 21.	Severe strabismus, sing. convergence, result of cereb. affect. in childhood.	Dec. 19, 1863, strabotomy. Surg. M. K. Taylor, U. S. V.	Accord of optics nearly normal. Discharged November 19, 1864.
12	Chandler, T., Pt., E, 7th Illinois Cavalry, age 33.	Leucoma of both eyes from purulent ophthalmia.	March 11, 1865, iridectomy by process of déchirement; both eyes. Surg. J. S. Hildreth, U. S. V.	Can see large objects. Discharged June 17, 1865; totally blind; pensioned.
13	Cornell, R. A., Pt., H, 103d Illinois, age 25.	1863, entropion left eye, result of granular ophthalmia; lashes in perpetual contact with the globe.	May 6, 1865, elliptical section of external integument of upper lid; new position maintained by three sutures. Surg. J. S. Hildreth, U. S. V.	Complete remedy, eyelashes all preserved and in their proper position; eyes weakened. Disch'd June 6, 1865; pensioned.
14	Crippen, J. H., Pt., E, 161st New York, age 26.	Cornea right eye ulcerated; slightly panniform and somewhat anæsthetic; neuralgic pains.	April 17, 1865, division of ciliary muscle. Surg. J. S. Hildreth, U. S. V.	Pain relieved, ulceration speedily modifying. Discharged June 19, 1865.
15	De Arcey, J., Pt., I, 1st Michigan Engineers, age 30.	Cornea of both eyes ulcerated; panniform and anæsthetic; repeated paracentesis on both eyes without relieving pain.	May 19, division of ciliary muscles of both eyes between external and inferior recti-muscles. Surg. J. S. Hildreth, U. S. V.	Disch'd Sept. 1, 1865; pain relieved, condition of eyes improved; right eye permanently destroyed; pensioned.

[1] For a ligation of the thoracica longa for an incised wound see *First Surgical Volume*, page 556, case of D. Hughes, 13th N. Y. Artillery. The instance of ligation of the branches of the mesenteric artery for a punctured wound will be found on page 62, CASE 206, of the *Second Surgical Volume*. Details of a case of ligation of the radial and also one of the ulnar artery, for incised wounds, are given on page 436 of the same volume; and three cases of ligation of the tibial artery are cited on page 7, CASES 5, 6, 7 of this volume. For ligation of iliac see CASE 978, p. 336, *Second Surgical Vol.*

No.	Name, Military Description, and Age.	Injury or Disease.	Operation and Operator.	Result and Remarks.
16	Doran, J. E., Pt., E, 3d Illinois Artillery, age 17.	Purulent ophthalmia with moderate chemosis of both eyes.	Aug. 29, 1864, division of ciliary muscle, right eye. Surg. J. S. Hildreth, U. S. V.	Cornea improved for a few days and then sloughed away; cornea of other eye also destroyed; blind. Discharged Aug 28, 1865.
17	Dunlap, G. S., Pt., B, 1st Missouri Cavalry, age 21.	Central leucoma of both eyes, caused by ophthalmia; right eye quite useless.	Dec. 31, 1864, operation for artificial pupil. Feb. 25, 1865, iridectomy of both eyes. Operator: Surg. J. S. Hildreth, U. S. V.	Disch'd April 13, 1865; has good vision.
18	Edward, J., contraband, age 25.	Protrusion and destruction of eyeball by sharp edge of hoe.	Feb. 2, 1864, excis. eye ball, edges of palpebral wound brought together by sutures. A. A. Surg. C. Pelaez.	Recovery March 6, 1864.
19	Elliott, J. M., Pt., H, 30th Kentucky, age 29.	Pannus covering cornea of right eye; total obscurity of vision.	Aug. 25, syndectomy. Pannus connecting necessitated re-operation. Sept. 9, disease reproducing itself. Hancock's operation performed Oct. 7. Surg. J. S. Hildreth, U. S. V.	Left hospital Oct. 16, 1865; pens'd. Totally blind; complete opacity and staphyloma of both cornea.
20	Ellsworth, J., Pt., A, 1st Michigan Artillery, age 24.	Gonorrhœal ophthalmia with large chemosis of both eyes.	Jan. 21, 1865, division of ciliary muscles of both eyes. Surg. J. S. Hildreth, U. S. V.	Discharged July 28, 1865; vision of right eye good, left eye lost from central leucoma.
21	Essing, R., Pt., B, 58th New York, age 40.	Entropion; both low. lids well marked.	Feb. 4, 1865, excision of triangular flap on both eyes. Surg. J. S. Hildreth, U. S. V.	Discharged May 17, 1865; defective vision; lids entirely recovered, natural condition.
22	Finn, A., Pt., A, 8th Veteran Reserve Corps, age 23.	Purulent ophthalmia with chemosis of both eyes.	Oct. 19, division of ciliary muscle. Surg. J. S. Hildreth, U. S. V.	Cornea sloughed away. Discharged Jan. 23, 1865; total loss of sight left eye; pensioned.
23	Flint, J. D., Pt., K, 13th Wisconsin, age 20.	Entropion caused by superabundance of integument.	April 18, 1865, removal of integument beneath lower lid right eye. A. A. Surg. M. L. Herr.	Discharged Nov. 28, 1865; claims pension for moon-blindness and loss of sight of right eye.
24	Frank, P., Pt., E, 58th Illinois, age 33.	Trichiasis right upper lid, caused by blepharitis and granular ophthalmia.	Sept. 9,'65, transposit'n "by a new process adopted for the first time, so far as known, in this case." Surg. J. S. Hildreth, U.S.V. Trichiasis left up. lid; same operation, same operator.	Disch'd Nov. 11, 1865; pensioned. Deformity and induration of both upper lids.
25	French, D. S., Pt., A, 70th New York, age 39.	Double entropion, caused by catarrhal inflammation of eyes.	Oct. 4, 1863, Janson's operation, Desmarres's modification. Surg. J. S. Hildreth, U. S. V.	Disch'd March 14, 1864; pensioned. Structural changes left eye, causing almost total loss of vision.
26	Furrow, W. P., Pt., E, 51st Illinois, age 29.	Cornea panniform and superficially ulcerated.	April 13, 1865, division of ciliary muscle left eye. Surg. J. S. Hildreth, U. S. V.	Disch'd June 19, 1865; eye greatly improved; pens'd. Loss of sight of left eye.
27	Garrett, D. J., Serg't, C, 9th Iowa, age 24.	Staphyloma	May 1, operated on by A. A. Surg. — Blickhalm.	Discharged Feb. 28, 1866; pens'd. "Total blindness left eye."
28	Getz, B., Pt., L, 4th Cavalry, age 24.	Staphyloma left eye, result of gonorrhœal ophthalmia; leucoma of right, result of purulent ophthalmia.	July 25, 1864, exc. of staphyloma, left eye. Jan. 7, '65, iridectomy of right eye, Desmarres's method of déchirement. Surg. J. S. Hildreth, U. S. V.	Discharged Aug. 10, 1865; pens'd. Total loss of left eye, imperfect vision of right eye.
29	Grieshaber, U., late Pt., K, 30th Missouri, age 37.	Artificial pupil of right eye; complete blindness.	July 12, 1864, operation for artificial pupil. Surg. A. Hammer, U. S. V.	Sight partially restored.
30	Haight, F. G., Corp'l, K, 15th Vet. Res. Corps, age 26.	Aug., 1864, purulent ophthalmia with chemosis of both eyes.	Oct. 2, 1864, division of ciliary muscle of right eye. Surg. J. S. Hildreth, U. S. V.	Cornea destroyed by ulceration. Disch'd June 4, '65; sight of right eye lost, left eye impaired.
31	Hamilton, W. W., Pt., A, 95th Illinois, age 21. (Discharged soldier.)	August, 1865, central hernia iris, left eye, from sloughing of cornea, result of purulent ophthalmia.	Sept. 16, 1865, iridectomy by déchirement. Oct. 11, Hancock's operation. Surg. J. S. Hildreth, U. S. V.	Nov. 8, 1865, extent of opacity of cornea disappearing; pens'd. Total loss of left eye.
32	Hayne, P., Serg't, C, 60th New York, age 33.	Defective vision right eye from central albugo, result of ulceration following fever.	Feb. 11, 1864, excision of portion of iris. Surg. J. S. Hildreth, U. S. V.	March 15, 1864, vision improving,
33	Hicks, W., Pt., I, 107th Illinois, age 30.	Large pterygium left eye.....	Jan. 14, 1865, Desmarres's operation. Surg. J. S. Hildreth, U. S. V.	Pterygium entirely displaced. Discharged May 22, 1865.
34	Hixon, H. A., Corp'l, H, 18th Massachusetts, age 23.	Strabismus internus (double); blepharitis, granular lids.	Sept. 16, 1863, Graefe's operation on rectus internus dexter. Dec. 1, '63, same operation on sinister. Surg. J. S. Hildreth, U. S. V.	Strabismus not completely corrected. Transferred March 9, 1864.
35	Hoffstetter, J., Pt., 48th Co. Vet. Reserve Corps, age 34.	Glaucoma of both eyes.....	Iridectomy both eyes. Surg. J. E. McDonald, U. S. V.	July 27, 1865; doing well.
36	Howard, M. H., Serg't, C, 1st Missouri Cavalry.	Small vascular tumor, upper eyelid.	May, 1863, tumor exc., its bed plugged with lint saturated with liq. ferri persulp. Surg. H. Culbertson, U. S. V.	Duty June 7, 1863.
37	Hughes, J. C., Pt., C, 1st Missouri Engineers, age 23.	Irido-choroiditis right eye; permanent contraction of pupil.	March 11, 1865, division of ciliary muscle. Surg. J. S. Hildreth, U. S. V.	Discharged June 19, 1865; claim for pension rejected.
38	Johnson, H. J. N., Pt., K, 14th Illinois Cavalry, age 19.	Partial staphyloma of right cornea from ulceration following erysipelas of face.	Oct. 15, 1864, excision of staphyloma, leucoma followed. March 4, 1865, iridectomy by process of déchirement. Surg. J. S. Hildreth, U. S. V.	Disch'd May 25, 1865; sight very imperfect, owing to atrophy of optic nerve; pensioned. Blind in right eye, left impaired.
39	Kennedy, J. M., Pt., K, 119th Illinois, age 23.	January, 1864, panniform cornea, surface covered with exudations.	April 13, 1865, divis. of ciliary muscle. Surg. J. S. Hildreth, U. S. V.	Disch'd June 27, 1865; panniform condition to a great extent disappeared; pens'd. Defective vision.
40	*Kenner, J.*, civilian prisoner, age 19.	Disorganization of right eye.....	Feb. 5, 1864, extirpation of right eye. Surg. J. H. Curry, U. S. V.	Escaped Feb. 24, 1864. Movement of muscles of eyeball preserved.
41	Knapp, C., Pt., K, 65th Illinois, age 56.	Moderate sized pterygium returned after previous operation.	Feb. 4, '65, Desmarres's meth. on left eye. Surg. J. S. Hildreth, U. S. V.	Pterygium entirely displaced. Disch'd Mar. 15, '65, cornea nebulous; pensioned. Impairment of sight.
42	Lamont, J., Pt., K, 8th Veteran Reserve Corps, age 49.	Cornea of left eye; ulceration; pain, which was not relieved by repeated paracentesis, etc.	April 26, 1865, divis. of ciliary muscle. May 13, operation repeated. Surg. J. S. Hildreth, U. S. V.	Cornea clean and in good condition; an artificial pupil will give him an excellent vision.
43	Long, Z. V., Pt., D, 9th Illinois Cavalry, age 22.	Ant. chamber both eyes nearly obliterated; irides attached to capsules, result of ophthalmia.	May 6, 1865, attempted excision of irides; division of ciliary ring of each eye; excision impracticable. Surg. J. S. Hildreth, U. S. V.	Discharged June 2, '65; total blindness both eyes; pensioned.
44	Mernin, J., Pt., F, 7th Minnesota, age 43.	Spurious cataract and occlusion of pupil right eye; total blindness.	Nov. 10, 1864, operation for artificial pupil by Surg. A. Hammer, U. S. V.	Disch'd June 2, 1865; complete and permanent loss of vision from ophthalmia and iritis; pensioned.
45	*Merritt, J. A. J.*, Corp'l, I, 6th Florida.	Complete staphyloma of cornea, result of confluent small-pox.	May 11, 1864, removal of eye.....	Recovery, with good stump for artificial eye.
46	Morris, O., Pt., F, 5th Maine, age 26.	November 4, 1863, splinter perforated cornea and wounded lens, left eye; splinter extracted.	Nov. 21, fragments of crystalline extracted, protruding parts of iris excised. Surg. J. S. Hildreth, U. S. V.	Transferred March 15, 1864; form of eye well preserved but vision lost.

No.	Name, Military Description, and Age.	Injury or Disease.	Operation and Operator.	Result and Remarks.
47	Myers, F. J., Pt., K, 11th N. Y. Cavalry, age 22.	Gonorrhœal ophthalmia of both eyes, ulceration, chemosis.	July 25, Hancock's operation; divis. of ciliary muscle. Surg. J. S. Hildreth, U. S. V.	Discharged Feb. 6, 1864. Pen. Ex. 1881, sight greatly impaired, etc.
48	Neville, C. W., Pt., E, 21st Missouri, age 17.	Staphyloma	Extirpation left eye.	Contracted small-pox; remain'g eye ulcerated, sloughed away. Disch'd Jan. 26, '64; pens'd; totally blind.
49	Nichols, A., Pt., L, 3d Michigan Cavalry, age 30.	March, 1864, ectropion of right eye.	July 12, operation by Surg. A. Hammer, U. S. V.	Duty Sept. 12, 1864; claims pension for disease of eyes resulting from measles.
50	O'Brien, D. J., Pt., C, 28th Massachusetts.	Congenital convergent strabismus of right eye.	June 8, 1863, operation by A. A. Surg. J. W. Cushing.	Result good; Veteran Res. Corps. Discharged December 13, 1864.
51	Oliphant, W. J., Pt., B, 132d New York, age 16.	Double divergent strabismus	Division of both externi recti. A. A. Surg. J. H. Hinton.	No change by operation; Veteran Reserve Corps January 31, 1864.
52	Oppelcust, G., Pt., K, 112th Illinois, age 35.	Staphyloma both cornea, and iris of right eye, from ophthalmia.	Sept. 10, '65, exc. of staphyloma, right eye, Desmarres's process. Surg. J. S. Hildreth, U. S. V.	Disch'd Oct. 16, 1865; pens'd. Operation of no benefit; can distinguish nothing. Died Sept. 11, '76; ch. diar.
53	Patterson, S. B., Pt., G, 8th Vet. Reserve Corps, age 34.	Chronic choroiditis of both eyes.	April 26, 1865, division of ciliary muscle, right eye. June 17, same operation on left eye. Surg. J. S. Hildreth, U. S. V.	Discharged July 3, 1865; defective vision; pensioned.
54	Pemberton, J., Pt., A, 5th Kentucky Cavalry, age 29.	Irido-choroiditis of right eye.	March 8, 1865, division of ciliary muscle, right eye. Surg. J. S. Hildreth, U. S. V.	Discharged June 17, 1865; affected with granular ophthalmia; pens'd; blind in left eye.
55	Plowman, A. J., Pt., A, 6th Maryland, age 27.	Pterygium, double at internal angle of either eye.	Dec. 11, 1863, displacement right eye by Desmarres's process. Feb. 11, 1864, same operat'n on left eye, using one stitch only to maintain position. Surg. J. S. Hildreth, U. S. V.	March 15, 1864, recovery; about ⅔ disappeared from right eye; left eye much more satisfactory owing to absence of second stich.
56	Scheming, A., Pt., G, 8th Vet. Reserve Corps, age 20.	Purulent ophthalmia with chemosis of both eyes.	Aug. 29, 1864, division of ciliary muscle, left eye; abscess; cornea finally sloughed away. Jan. 7, '65, staphyloma excised. Aug. 23, '65, iridectomy of right eye. Surg. J. S. Hildreth, U. S. V.	Discharged Aug. 26, 1866, and pensioned; no vision in left eye; right eye affords enough sight to enable him to go about alone.
57	Shafer, W., Pt., F, 123d Illinois, age 39.	Purulent ophthalmia, large chemosis of both eyes.	Sept. 2, division of ciliary muscle of right eye. Surg. J. S. Hildreth, U. S. V.	Discharged March 6, 1865; pens'd. Right eye totally blind, left eye can only discern light.
58	Smith, A., Pt., F, 8th Veteran Reserve Corps, age 25.	Nebulous condition of cornea of both eyes.	March 8, 1865, iridectomy of both cornea. Surg. J. S. Hildreth, U.S.V.	Disch'd May 24, '65. Sight improv'g, bids fair to become good enough to enable him to read fine print.
59	Street, G. S., Pt., M, 1st Conn. Artillery, age 34.	Excessive myopia of both eyes	June 15, Hancock's operation, right eye. Surg. J. S. Hildreth, U. S. V.	Myopia disappeared. Disch'd Dec. 13, 1863; pensioned. Amblyopia; right eye useless, sight feeble.
60	Sullivan, J., Pt., G, 2d Mass. Cavalry, age 21.	Staphyloma of cornea and iris, result of ulceration.	Feb. 2, 1864, excision of tumor with staphyloma. Surg. J. S. Hildreth, U. S. V.	Disch'd August 12, 1864. Loss of vision of left eye; sight of right eye impaired; pensioned.
61	Tibbitts, W., Pt., H, 147th N. York, age 25.	Staphyloma of cornea of left eye; catarrhal ophthalmia.	June 1, cornea removed by Surg. J. E. McDonald, U. S. V.	Discharged July 19, 1865; pens'd. Loss of sight of left eye.
62	Toomey, J., Pt., G, 18th Missouri, age 21.	Internal strabismus	May 6, 1865, Graefe's operation, separating digitations of tendons from sclerotic. Two-thirds of error corrected. Surg. J. S. Hildreth, U.S.V.	Operation on other eye will correct deformity. Discharged July 24, 1865.
63	Ulrich, H., Pt., K, 63d Illinois, age 25.	Purulent ophthalmia; large chemosis of both eyes.	Sept. 25, 1864, division of ciliary muscles of both eyes. Feb. 11, '65, excision staphyloma, left eye. Surg. J. S. Hildreth, U. S. V.	Discharged April 27, 1865. Loss of sight left eye, cornea of right eye nebulous; pensioned.
64	Unknown	Chronic inflammation of lachrymal sac, with mucous discharge.	May, 1863, sac opened and tent introduced to obliterate sac and set up new action in lining membrane. Surg. H. Culbertson, U. S. V.	Doing well.
65	Unknown	Chronic inflammation of lachrymal sac attended with mucous discharge.	May —, same operation as in case 64. Surg. J. H. Culbertson.	Doing well.
66	Van Curen, C., Pt., E, 17th Wisconsin, age 46.	Staphyloma cornea; sight obliterated.	June 27, division of cornea with cataract knife, removal of lower section with scissors. Surg. H. C. Culbertson, U. S. V.	Active conjunctivitis and corneitis resulted. Duty Nov. 28, 1864; pensioned. Loss of left eye and chronic ophthalmia right.
67	Van Tassel, E., Pt., A, 120th New York, age 19.	Fistula of lachrymal's left eye; abscess at internal canthus.	Feb. 5, 1864, introduction of style by the usual method. A. A. Surg. J. M. McGrath.	March 6, active inflam. set in; style removed, tinct. chlor. iron injected. Discharged July 31, 1865.
68	Vosburg, J., Pt., K, 3d Minnesota, age 43.	April 6, 1864, purulent ophthalmia; large chemosis of both eyes.	Oct. 7, division ciliary muscle, right eye. Surg. J. S. Hildreth, U. S. V.	Cornea sloughed away. Discharged June 13, '65; sight of right eye lost, central nebulosity of left; pens'd.
69	Welch, J., Pt., B, 17th Michigan, age 43.	Large ulceration of cornea following chronic ophthalmia; sloughing.	Dec. 31, '64, divis. ciliary muscle, left eye. Surg. J. S. Hildreth, U. S. V.	Discharged June 28, 1865; pens'd. Sight of left eye lost.
70	Welsh, P., Pt., D, 28th Kentucky, age 35.	Entropion left eye, upper lid	Dec. 30, 1863, excision of oval piece of integument sutures. A. A. Surg. G. P. Hackenburg.	Duty, and discharged Feb. 8, 1865; pensioned for wounds.
71	Whipple, H. L., Pt., E, 77th New York, age 30.	Cataractous lens dislocated into ant. chamber of left eye; blow, September, 1862.	Dec. 29, 1862, lens extracted by superior section of coroca. Surg. D. P. Smith, U. S. V.	Disch'd March 23, 1863. Very tolerable vision; pension claim rejected. *Spec.* 1195.
72	Williamson, J., Pt., D, 174th New York, age 20.	Symblepharon left lower lid with cornea.	Nov. 2, '63, symblepharon dissect. up, conjunctiva of globe drawn together by sutures A.A.Surg. J.H. Hinton.	Duty January 6, 1865.
73	Wycoff, D. E., Serg't, F, 108th New York, age 20.	Anchyloblepharon both eyes from inflammation of lids.	Jan. 25, 1864, separation of lids from globe of right eye with probe-pointed scissors. Feb. 24, same operation on left eye. Surg. J. S. Hildreth, U.S.V.	Recovery, with ability to use eyes and read some. Disch'd Aug. 12, 1864; pensioned. Died April 9, 1866; phthisis pulmonalis.
74	Young, A. W., Serg't, L, 12th Tennessee Cavalry, age 29.	Large central leucoma both eyes, result of purulent ophthalmia; only a small part of each cornea remained transparent.	July 27, 1865, iridectomy both eyes by process of déchirement. Aug. 25, operation on left eye to enlarge pupil. Surg. J. S. Hildreth, U. S.V.	Vision of both eyes improving. Discharged October 20, 1865; pens'd. Nearly blind.
75	Curtis, J., Pt., E, 12th Indiana, age 42.	Sarcoma, right eye entirely destroyed, inflamed, ulcerated, and protruding from orbit.	May 15, 1865, whole diseased eye removed with bistoury. A. A. Surg. E. Seyffarth.	No pain after operation. June 30, eye healed. Died July 5, 1865; debility.
76	Wolf, J. H., Musician, E, 12th Penn. Reserves, age 26.	Pterygium, double	Dec. 11, 1863, displacement of pterygium, right eye. Desmarres's method. Surg. J. S. Hildreth, U. S. V.	Doing well; injured in a street affray and died December 27, 1863.

OPERATIONS ON THE MOUTH AND ITS APPENDAGES.—Three plastic operations for disease have been detailed in the *First Surgical Volume.*[1] One operation for hare-lip will be added:

CASE 1016.—Private Morell Seely, Co. F, 103d Ohio, aged 21 years, was admitted into Cumberland Hospital, Nashville, March 7, 1864, with gunshot wound of left leg, middle third, with injury to tibia. Patient also had congenital hare-lip. On March 15, 1864, Surgeon C. McDermont, U. S. V., operated for hare-lip, without anæsthesia. Two interrupted sutures, one uniting mucous membrane on inner border of lip, used with dressings of adhesive plaster. Union by first intention within five days; patient fed on liquid food. The wound of the leg did well. The patient recovered and was furloughed April 13, 1864.

OPERATIONS ON THE AIR PASSAGES.—To the six cases of laryngotomy for disease, recorded on page 417 of the *First Surgical Volume*, should be added a fatal operation performed for sore throat following typhoid fever, making seven cases of this operation with only one recovery:

CASE 1017.—Private Samuel Mitchell, Co. C, 12th Infantry, was admitted into hospital No. 1, Frederick, September 19, 1862. Acting Assistant Surgeon W. W. Keen, jr., reported: "Had had typhoid fever followed by sore throat. On October 5th, 3 P. M., the respiration became somewhat embarrassed and grew rapidly worse, till at 4 P. M. Dr. G. L. Potter, the officer of the day, was hurriedly summoned. The neck was observed to be swollen, especially on the right side; there was great dyspnœa, both in inspiration and expiration, coldness of the extremities, and insensibility. Laryngotomy, on examination of the epiglottis, was immediately resolved upon, but the patient revived scarcely at all, although the respiration through the artificial opening was free, and in about fifteen minutes ceased to breathe. *Post-mortem* twenty-four hours after death: The tonsils are deeply eroded, the epiglottis erect and firm, not from œdema but from effusion of lymph about the vocal cords. There is a marked plastic effusion, especially on the right side. The lungs are congested and somewhat filled with œdema; other organs healthy, save Peyer's patches, which are ulcerated to some extent."

OPERATIONS ON THE CHEST AND ABDOMEN.—For the cases of thoracentesis, herniotomy, and paracentesis, the reader is referred to pp. 573–598 of the *First*, and pp. 187–191 of the *Second Surgical Volume.*

OPERATIONS ON THE GENITO-URINARY ORGANS.—With the exception of ten instances of removal of testes, the operations on these parts have been fully discussed in the *Second Surgical Volume.*[2] Two of the ten cases proved fatal:

CASES 1018–1027.—*Removals of the testes.*—Private J. B—, Co. F, 77th New York, age 23; bruise of right testicle against pommel of saddle, September 1, 1864. Testicle and spermatic cord greatly enlarged; three fistulous openings through scrotum discharging pus. December 10th, right testicle removed by Acting Assistant Surgeon H. Pearce. Returned to duty March 19, 1865.—Private *J. S. D*—, conscript, C. S. A., age 33. October 28, 1863, incision at superior portion of scrotum, testicle forced through the aperture and exscinded by himself. November 2d, serious hæmorrhage, which recurred on November 6th, when artery was ligated. Furloughed November 23, 1863.—Private E. G—, Co. H, 30th Illinois, age 24. January 8, 1864, excision of left testicle by Assistant Surgeon W. Feland, 30th Illinois, on account of scirrhus. Gangrene, secondary hæmorrhage from spermatic artery. June 30th, wound nearly healed and doing well. Mustered out September 8, 1864.—Lieutenant G. W. H—, 173d Ohio, age 28; sarcocele of right testicle of nine months' duration; tumor a little larger than an ordinary goose egg. February 6, 1865, testicle removed by Acting Assistant Surgeon J. A. Hall. Mustered out May 15, 1865.—Private D. P. H—, Co. E, 30th Colored Troops, age 20; chronic orchitis; right testicle much enlarged and painful. Testicle removed and spermatic artery tied by Acting Assistant Surgeon O. Shittler. Discharged July 31, 1865.—Private J. M. J—, Co. D, 146th New York, age 24; injury to right testicle by fall from horse. Excision of right testicle. Discharged September 25, 1865.—Captain G. McP—, 8th Tennessee Cavalry, age 36; cystic sarcocele; right testicle enlarged to the size of a goose egg. July 7, 1864, right testicle removed by Surgeon J. E. Herbst, U. S. V. Returned to duty August 10, 1864.—W. S—, colored civilian, age 50; left testicle enlarged to the size of a small cocoanut; dragging pain when walking. November, 1864, removal of left testicle by Assistant Surgeon S. J. Bumstead, 29th Illinois. The organ when removed weighed two and a quarter pounds. It was contributed to the Army Medical Museum by the operator, and is numbered 3654 of the *Surgical Section*. The patient recovered.—Private J. C—, Co. B, 3d East Tennessee Vols.; cystic enlargement of left testis. March 29, 1864, extirpation of left testicle by Assistant Surgeon B. E. Fryer, U. S. A. Erysipelas attacked the parts, extending to the abdomen. Died May 31, 1864, of peritonitis.—Captain E. D. L—, 43d Wisconsin, age 32; sarcocele of right testicle, the result of injury. March 16, 1865, removal of right testicle by Surgeon J. E. Herbst, U. S. V. Furloughed April 9, 1865. Died June 2, 1865, cause not stated.

[1] Cases of E. E. Sadler, Co. C, 9th Iowa Cavalry, p. 369; H. Kennedy, citizen, p. 370; and Pt. C. Burgan, Co. B, Purnell Legion, p. 375.

[2] Cases of lithotomy, page 282; operations for *fistula ani*, page 321; operations for removal of piles, page 322; operations for phymosis, page 343; external perineal urethrotomy, page 400; operations for hydrocele, page 420. Two cases of extirpation of the testes on account of contused wounds have been cited: P. W. Lucas, 1st Virginia Battalion, page 414, and Recruit H. D. Taner, page 418.

CHAPTER XII.

WOUNDS AND COMPLICATIONS.

The subject of injuries affecting the several regions of the body having been thoroughly discussed throughout the preceding portions of this history, the present chapter will be devoted to a general consideration of wounds and complications, in the course of which the endeavor will be made to use, to the best advantage, the large amount of material accumulated during the late war, illustrative of facts of general interest and of statistical value relating to wounds; of the nature, peculiarities, and effects of missiles and projectiles used in warfare; of the conditions affecting the course and result of wounds, with especial reference to the graver complications of secondary hæmorrhage, erysipelas, pyæmia, gangrene, and tetanus.

During the late war there were treated two hundred and forty-six thousand seven hundred and twelve (246,712) cases of wounds by weapons of war. Of these, two hundred and forty-five thousand seven hundred and ninety (245,790) were shot wounds, and nine hundred and twenty-two (922), or 0.37 per cent., were sabre and bayonet wounds. The average percentage of sabre and bayonet wounds in the European Wars during the last twenty years was 2.4, as shown in the following table:

TABLE CXIV.

Frequency of Sabre and Bayonet and Shot Wounds on Occasions named and from Authorities quoted.

OCCASIONS.	INJURIES.			Percentage of Sabre and Bayonet Wounds.
	Total.	Sabre and Bayonet.	Shot.	
English in the Crimean War, 1854–57 (MATTHEW[1])	10,129	158	9,971	1.5
French in the Crimean War, 1854–57 (CHENU[2])	26,811	818	25,993	3.0
French in the Italian War, 1859 (CHENU[3])	15,966	565	15,401	3.5
Austrians at Verona, 1859 (RICHTER[4])	18,521	543	17,978	2.9
Austrians at Montebello, 1859 (RICHTER[5])	281	54	227	19.2
Germans in Schleswig-Holstein War, 1864 (LOEFFLER[6])	3,232	61	3,171	1.8
French in Mexico, 1864 (BINOT[7])	85	19	66	22.3
Six Weeks' War in Germany, 1866, Bavarians (RICHTER[8])	1,697	56	1,641	3.3
Six Weeks' War, 1866, Italians (CORTESE[9])	2,903	92	2,811	3.1
Six Weeks' War in Germany, 1866, Prussians and Austrians (RICHTER[10])	8,527	333	8,194	3.9
Franco-Prussian War, 1870–71, Germans (FISCHER[11])	54,268	786	53,482	1.4
Aggregates	142,420	3,485	138,935	2.4

In comparison with the large number of shot wounds, the number of sabre and bayonet wounds seems insignificant, offering a striking commentary upon the advance of

[1] MATTHEW (T. P.), *Medical and Surgical History of the British Army which served in Turkey and the Crimea, etc.*, London, 1858, Vol. II, pp. 257, 259. [2] CHENU (J.-C.), *Rapport au Conseil de Sant' des Armées, etc., pendant la Campagne d'Orient en* 1854–1855–1856, Paris, 1865, p. 627. [3] CHENU (J.-C.), *Statistique Méd. Chir. de la Campagne d'Italie en* 1859 *et* 1860, Paris, 1869, T. II; the figures here given were obtained from a compilation of the

modern military science, and showing that with the general adoption of long-range repeating fire-arms the sabre and bayonet are rapidly falling into disuse, and that the time is coming, if it has not already arrived, when these old and honored weapons will become obsolete;[1] and when such wounds from these sources will be regarded rather as incidents of battle than as the results of regular tactical manœuvres.

SABRE AND BAYONET WOUNDS.—Of the nine hundred and twenty-two (922) cases of these injuries reported in detail throughout the history, and grouped together in the following table, a large proportion had their origin in private quarrels or broils, or were inflicted by sentinels in the discharge of their duty:

TABLE CXV.

Summary of Nine Hundred and Twenty-two Sabre and Bayonet Wounds recorded during the American Civil War, 1861–65.

SEAT OF INJURY.	TOTAL NUMBER OF CASES.	SABRE.					BAYONET.				
		Cases.	Recoveries.	Fatal.	Undetermined Results.	Mortality.	Cases.	Recoveries.	Fatal.	Undetermined Results.	Mortality.
Sabre and Bayonet Wounds of Scalp	300	282	276	6	.....	2.1	18	16	2	.....	11.1

The fatality of these wounds as indicated in the table is small, perhaps exceedingly so when it is considered that these injuries derive their importance from their tendency to excite inflammatory action in deep-seated tissues and cavities, with the danger of forma-

tabular statements on pp. 424 to 836 of the second volume of Dr. CHENU'S work; the summary on p. 849 of his work includes the injuries of a miscellaneous character, which have been eliminated in this calculation. [10] RICHTER, *loc. cit.*, p. 905. [11] FISCHER (G.), *Statistik der in dem Kriege* 1870–71, *vorgekommenen Verwundungen und Tödtungen, etc.*, Berlin, 1876, p. 7. The total number of sabre and bayonet and shot wounds cited by FISCHER is 61,959; but this number includes 7,691 killed on the battlefield, which have been dropped in this tabulation, as the killed are not included in any of the authorities quoted.

[1] The following is an extract from a letter on file in this office from General ROBERT WILLIAMS, Assistant Adjutant General, in reply to inquiries made by the late Surgeon G. A. OTIS, U. S. A.:

"ADJUTANT GENERAL'S OFFICE, WASHINGTON, *March* 24, 1868.

"DEAR DOCTOR: Yours of the 18th instant, containing certain queries, has been received; in reply to your questions I would say . . . hand to hand skirmishes between cavalry during the late rebellion were not at all infrequent; but the pistol and carbine were more commonly relied upon. Sabre wounds were slight and generally harmless, as the sabre was in few instances sharpened, and the men were almost totally uninstructed in its use. Hand to hand combats between cavalry mounted and infantry were, I believe, of rare occurrence; in almost every case the cavalry was dismounted and fought as infantry. . . . Owing to the present long-range and repeating weapons, with which both cavalry and infantry are now armed, it is my belief that the lance may be regarded as obsolete and that the sabre will soon become so. Yours truly, ROBERT WILLIAMS, *Ass't Adjutant General.*"

tion and confinement of pus; from the chances of injury to blood-vessels, nerves, and viscera, and the possibility of pyæmia, gangrene, and tetanus.

As might be anticipated, wounds by the sabre involve chiefly such parts of the body as are especially exposed to blows in the ordinary use of this weapon; thus injuries of the head and upper extremities are more largely represented, while wounds from the bayonet show a decided preponderance in the lower extremities.[1]

Wounds from sabre blows[2] were not of a grave character, except in cases involving the cranial cavity, where the mortality attained its highest percentage. Seven cases recorded in previous chapters of the history show fractures of one or both bones of the forearm by sabre blows; in one case primary, and in another secondary amputation became necessary.[3] One fatal case of tetanus is reported as following an incised sabre fracture of the cranium; also one case of pyæmia from a similar cause. Epilepsy, insanity, loss of vision and hearing, and impairment of mental faculties seem to have been among the remoter effects of injuries of the cranium from this cause.

The fatality of bayonet wounds exceeds that of sabre wounds by 2.7 per cent., and is chiefly due to injuries of viscera and large blood-vessels. The heart, lungs, diaphragm, liver, stomach, jejunum, and spleen are noted as having been punctured; and of the blood-vessels, the common iliac, femoral, internal pudic, and brachial were involved.

The fatal cases of bayonet wounds of the lower extremities, five in number, resulted from gangrene in three cases, and from primary hæmorrhage and pyæmia in one instance each. The median and sciatic nerves were lacerated in two cases, and the penis punctured in one. No case of tetanus is reported as following a bayonet wound.

SHOT WOUNDS.—The consideration of generalities on shot wounds, their nature, frequency, fatality, and principal complications will be preceded by a tabular summary of all shot wounds of which records are found in this Office. In the introductory memorandum of the *Second Surgical Volume* and in the various sections throughout the work the total number of wounds of the portions of the body under consideration, so far as known at the time, were indicated. Since then additional reports and records of hospitals, especially field hospitals, frequently subjected to the varying fortunes of a successful or unsuccessful campaign, records which in some instances were supposed to have been lost or destroyed, have been received at this Office, as the work on the surgical history progressed, increasing somewhat the total number of injuries. There undoubtedly remain, even at the present time, quite a number of casualties of which there are no histories on file, especially of the early part of the war in 1861, when each regiment and sometimes each detachment of troops, before the establishment of base and general hospitals, continued to find shelter for its more seriously injured patients in tents or buildings temporarily occupied which offered no facilities for keeping records, and when volunteer officers and also enlisted men were allowed to proceed from the battle-fields to their homes to be treated by their family physicians. A few special reports of some of the most interesting of these cases have been received at this Office; but undoubtedly quite a large proportion failed to be recorded at all. Furthermore, after general engagements many circumstances interfered with the efforts of medical

[1] Of 522 sabre wounds, 368 were wounds of the head and 97 of the upper extremities, making a total of 465, or 89 per cent. of the whole number. Of 400 bayonet wounds, 184, or 46 per cent., were in the lower extremities.

[2] Examples have been cited in the *First Surgical Volume*, on pp. 1 to 30, of sabre wounds of the head; on p. 322, of the face; on p. 399, of the neck; in the *Second Surgical Volume*, on pp. 3, 4, of the abdominal parietes; on p. 32, of simple perforations of the abdominal cavity without visceral injury; on pp. 61, 62, of the small intestines; on p. 76, of the large intestines; on p. 129, of the liver; on p. 429, of the back; on pp. 435, 436, of the upper extremities; on p. 473, of the clavicle and scapula; on pp. 828, 829, of the elbow joint; and in the *Third Surgical Volume*, on p. 7, of sabre flesh wounds of the lower extremities.

[3] CASES: 1845, 1846, on page 919, *Second Surgical Volume*, of Privates William Billows and Corwin Davis.

officers to obtain accurate details of the number of wounded, and no record could be made of the wounded among those reported as captured and missing. The shot wounds now recorded number two hundred and forty-five thousand seven hundred and ninety (245,790). They have been grouped in three tables, the first containing shot wounds of the head, face, and neck, the second those of the trunk, and the third those of the extremities:

TABLE CXVI.

Tabular Statement of the Shot Wounds of the Head, Face, and Neck recorded during the American Civil War.

NATURE AND SEAT OF INJURY.		RESULTS. Totals.	Recoveries.	Deaths.	Undeterm'd Results.	Percentage of Fatality.

	Wounds injuring Larynx and Œsophagus	1	1	.....	.....	.....
	Wounds injuring Pharynx and Œsophagus	1	1	.....	.....	.....
	Wounds injuring Pharynx and Larynx	2	.....	2	.....	100.0
	Total Shot Injuries of the Neck	4,895	3,496	618	781	15.0

Aside from flesh wounds of the scalp, and slighter forms of contusion and fracture, shot wounds of the head were of a very fatal character, the ratio of mortality following closely upon the degree of injury inflicted upon the brain and its appendages. Fractures of the inner table of the cranial bones were of difficult diagnosis, and could in general be substantiated only after *post-mortem* inspection. Perforating gave slightly more favorable results than penetrating fractures; this may have been due to the fact that less vital portions were involved, or that these wounds were more satisfactorily treated, being freed from the complications attending the lodgement of foreign bodies. The results of shot injuries of the face confirm the opinion that these wounds commonly do well, notwithstanding the amount of destruction apparent at the time of injury. The records have furnished sufficient

[1] See *First Surgical Volume*, p. 308, TABLE VII. [2] See *First Surgical Volume*, p. 382, TABLE XIV. [3] See *First Surgical Volume*, p. 414, TABLE XVII.

material, already alluded to in a previous chapter, to show a remarkable degree of success in the treatment of such cases. The high mortality of shot wounds of the neck is almost necessarily to be expected from lesions of parts of great vital importance, placed in close relation with the great nervous and vascular trunks found in this region.

TABLE CXVII.

Tabular Statement of the Shot Wounds of the Spine, Chest, Abdomen, Pelvis, and Back recorded during the American Civil War.

NATURE AND SEAT OF INJURY.		Totals.	Results.			Percentage of Fatality.

SHOT WOUNDS OF THE BACK	Reported as Shot Wounds of the Back	3,486	3,024	172	290	5.3
	Specified as over the Posterior Thoracic Region	990	886	51	53	5.4
	Specified as over the Posterior Abdominal Region	698	620	51	27	7.6
	Specified as wounds of Hips, Buttocks, Nates, etc	7,507	6,353	526	628	7.6
	Total Shot Injuries of the Back	12,681	10,883	800	998	6.9

The great fatality of undoubted shot penetrations of the abdomen alluded to on page 204 of the *Second Surgical Volume* is apparent in the preceding table; of three thousand four hundred and eighty-nine (3,489) determined instances of such lesions, three thousand and thirty-five (3,035) had fatal terminations, a mortality rate of 86.9 per cent., exceeding that of the shot fractures of the cranium with penetration of the brain, which, as indicated in TABLE CXVI, was 82.7 per cent.; even the large fatality of shot fractures of the hip, 84.7, in the succeeding table, is in some measure due to complications with injuries of the viscera of the abdominal cavity.

TABLE CXVIII.

Tabular Statement of the Shot Wounds of the Upper and Lower Extremities recorded during the American Civil War.

NATURE AND SEAT OF INJURY.		Cases.	Results.			Percentage of Fatality.
			Recoveries.	Deaths.	Undeterm'd Results.	
SHOT WOUNDS OF THE UPPER EXTREMITIES.	Flesh Wounds of the Upper Extremities[1] 54,729	54,801	53,095	1,634	.....	2.9
	Periarticular Wounds of Shoulder Joint[2] 72		66	6	.....	8.3

	Fractures of the Bones of the Ankle Joint[23]	1,711	1,239	457	15	26.9
	Contusions of the Bones of the Foot[24]	27	26	1	.....	3.7
	Fractures of the Bones of the Foot[25]	5,832	4,942	450	440	8.3
	Total Shot Wounds of Lower Extremities	86,413	73,665	11,813	935	13.8

With two exceptions the generally accepted rule in fractures of the extremities, that the ratio of fatality diminishes with increased distance of the injury from the trunk, is

[1] *Note* 1, page 435, *Second Surgical Volume.* [2] Page 502, *Second Surgical Volume.* [3] TABLE XVI, page 474, *Second Surgical Volume.* [4] On page 503, *Second Surgical Volume*, 505 shot fractures of the shoulder joint treated conservatively are accounted for. To these should be added 640 cases of excisions after fractures of the shoulder joint (not 670, as erroneously stated on page 519, as 245, not 215, were for fractures involving the humerus near the shoulder joint) and 203 instances of amputation following fractures of the shoulder joint. The total number of amputations at the shoulder was 852; but of this number only 203 were for fractures of the bones of the joint. The remaining 649 cases were: 621 for fractures of the arm (TABLE LV, p. 666), 17 for fractures of the elbow (TABLE CV, p. 829), 6 for fractures of the forearm (TABLE CXXIV, p. 922), 3 for fractures of the wrist (TABLE CXLI, p. 996), and 2 for fractures of the hand (TABLE CXLIV, p. 1019). [5] Page 601, *Second Surgical Volume.* [6] TABLE LV, p. 666, *Second Surgical Volume.* [7] TABLE CV, page 829, *Second Surgical Volume.* [8] TABLE CXIX, pp. 898-9, *Second Surgical Volume.* [9] TABLE CXXIV, page 922, *Second Surgical Volume.* [10] TABLE CXLI, page 996, *Second Surgical Volume.* [11] Pages 1012-13, *Second Surgical Volume.* [12] TABLE CXLIV, page 1019, *Second Surgical Volume.* [13] Pages 8-60, *ante.* [14] Pages 24-32, *ante.* [15] TABLE IX, page 65, *ante.* [16] TABLE XIX, page 170, *ante.* [17] TABLE XX, page 175, *ante.* [18] Pages 363-367, *ante.* [19] TABLE LII, page 367, *ante.* [20] Pages 427-432, *ante.* [21] TABLE LXI, page 432, *ante.* [22] Pages 577-578, *ante.* [23] TABLE LXXXVII, page 578, *ante.* [24] Pages 617-619, *ante.* [25] TABLE XCV, page 619, *ante.*

verified in this table. In the upper extremities the fractures of the wrist had a greater fatality than those of the forearm (12.9 and 9.4 per cent. respectively), and in the lower extremities the results of the injuries of the knee joint were slightly less favorable than those of the femur, the fatality rate being in the former 53.8, in the latter 53.1 per cent., although the difference 0.7 per cent. is very trifling. That the wounds of the joints are of a more serious nature than those of the long bones immediately above them has been shown in numerous tabular statements throughout the preceding volumes, yet the percentages of fatality do not seem to have been proportionally increased. But the joint wounds were far more frequently followed by excision and amputation, and it would seem therefore that the increased ratio of operation had tended to reduce the percentage of fatality.

Longmore[1] cites from Albinus, Liharzik, Marshall, and from measurements of the Pythian Apollo and Farnesian Hercules, the relative amounts of superficial area presented by the principal divisions of the human body, and gives as the mean of these measurements the following percentage of the whole target area of the body: For the head, face, and neck, 8.51 per cent.; for the trunk, 28.91; for the upper extremities, 21.14; for the lower extremities, 41.41. If battles were fought and decided on level and unobstructed ground we might find that the percentages of the injuries inflicted on the various sections of the human body would correspond with the proportional percentage of the area; but it is evident that the nature of the field of operations, whether fortified places or the open plain or rolling wooded districts, must necessarily change the relative regional frequency of injuries. Of the wounds that came under treatment in the American civil war, as shown in the following table, 10.77 per cent. were injuries of the head, face, and neck, 18.37 of the trunk, 35.71 of the upper extremities, and 35.15 of the lower extremities.

TABLE CXIX.

Table indicating Percentage of Fatality and Relative Frequency of Shot Wounds recorded during the War of the Rebellion.

SEAT OF INJURY.	Total Cases.	RESULTS.			Percentage of Fatality.	Relative Frequency.	
		Recoveries.	Deaths.	Undeterm'd Results.			
Shot Injuries of the Head	12,089	6,573	2,676	2,840	28.9	10.77	14.91
Shot Injuries of the Face	9,416	7,406	462	1,548	5.8		3.87
Shot Injuries of the Neck	4,895	3,496	618	781	15.0		1.99
Shot Injuries of the Spine	642	279	349	14	55.5	18.37	0.26
Shot Injuries of the Chest	20,264	13,921	5,373	970	27.8		8.24
Shot Injuries of the Abdomen	8,438	3,455	3,293	1,690	48.7		3.43
Shot Injuries of the Pelvis	3,159	2,194	930	35	29.7		1.28
Shot Flesh Wounds of the Back	12,681	10,883	800	998	6.9		5.16
Shot Injuries of the Upper Extremities	87,793	80,090	5,608	2,095	6.5	35.71	
Shot Injuries of the Lower Extremities	86,413	73,665	11,813	935	13.8	35.15	
Aggregates	245,790	201,962	31,922	11,906	13.6	00.00	

According to this tabular statement the injuries of the extremities form 70.86 per cent. of the total number of wounded, and the proportion of the wounds of these parts would therefore appear disproportionately large. But it must be borne in mind that the figures here given only constitute a portion of the injuries received, as the large number of killed are not included in these calculations. The records in this Office show the seat of

[1] LONGMORE (T.). *Gunshot Injuries*, London, 1877, page 595.

injury in only one thousand one hundred and seventy-three cases of soldiers killed on the battle-field. Of these, four hundred and eighty-seven (487) were of the head and neck, six hundred and three (603) of the trunk, thirty (30) of the upper extremities, and fifty-three (53) of the lower extremities. In the Introductory to the *First Surgical Volume*, at page XXVI, it has been stated that the total number of killed, according to the Adjutant General's Report, was not less than forty-four thousand two hundred and thirty-eight (44,238). Applying the proportions of the one thousand one hundred and seventy-three (1,173) cases, viz: four hundred and eighty-seven (487) of the head, six hundred and three (603) of the trunk, thirty (30) of the upper extremities, fifty-three (53) of the lower extremities, to this total of forty-four thousand two hundred and thirty-eight killed, we would have eighteen thousand three hundred and sixty-seven (18,367) killed from wounds of the head, twenty-two thousand seven hundred and forty-one (22,741) from injuries of the trunk, one thousand one hundred and thirty-one (1,131) from wounds of the upper extremities, one thousand nine hundred and ninety-nine (1,999) from casualties in the lower extremities. Adding to these the cases of wounded according to the above table, viz: twenty-six thousand four hundred (26,400) of the head, forty-five thousand one hundred and eighty-four (45,184) of the trunk, eighty-seven thousand seven hundred and ninety-three (87,793) of the upper extremities, eighty-six thousand four hundred and thirteen (86,413) of the lower extremities, we have a total of injuries according to regions of body, including killed and wounded, of forty-four thousand seven hundred and sixty-seven (44,767) head, sixty-seven thousand nine hundred and twenty-five (67,925) trunk, eighty-eight thousand nine hundred and twenty-four (88,924) upper extremities, eighty-eight thousand four hundred and twelve (88,412) lower extremities; or, according to percentages, of 15.44 per cent. injuries of the head, 23.42 per cent. injuries of the trunk, 30.66 per cent. injuries of the upper extremities, 30.48 per cent. injuries of the lower extremities, making a total of 61.14 per cent. of injuries of the extremities.

Whether we take into consideration the percentage of the injuries of the upper extremities derived from the total wounded and killed, 30.66 per cent., or that obtained from the number of soldiers treated for wounds only, 35.71, the regional proportion of these injuries is very large. The same is to be said of the relative frequency of the wounds of the head, face, and neck, amounting to 10.77 per cent. of the wounded and 15.44 per cent. of the wounded and killed. But the protection afforded to the lower extremities and the trunk in the many siege operations, by parapets, and in field operations, especially during the severe and extended campaign beginning with the battles of the Wilderness, Spottsylvania, Cold Harbor, and ending with the siege of Petersburg, by trenches, ditches, behind trees, etc., screened those parts to a large extent from injury, while the head and upper extremities were continually exposed to the practised eye of a vigilant foe.

The influence exerted by the nature of the military operations on the regional percentage of injuries is well illustrated in the next table, in which it has been attempted to give the proportions of the injuries of the head, face, and neck, the trunk, and the extremities, from the most reliable accounts of European and other campaigns. The percentages of the injuries of the head varies from 20.2 per cent. among the French in the Crimean campaign in 1854–57, to 6.4 per cent. in the Revolution in Paris in 1830; the percentage of the trunk from 31.2 in the New Zealand Campaign in 1863–65, to 9.3 in the Mutiny in India in 1859; the percentages of the upper extremities from 39.3 per cent. in the Russo-Turkish War, 1876–77, to 18.8 in the campaign in the Kabylie in 1854–57; and the

percentages of the lower extremities from 48.2 in the same campaign, to 27.1 in the New Zealand War in 1863–65, and it will be noted that the fluctuations are the largest in campaigns confined to a limited territory. But of the entire number of two hundred and sixteen thousand three hundred and forty-eight (216,348) cases here referred to, thirty-one thousand one hundred and eighty-four (31,184), or 14.4 per cent., were injuries of the head, face, and neck; forty-five thousand five hundred and eighty-three (45,583), or 21.1 per cent., injuries of the trunk; sixty-six thousand four hundred and seventy-five (66,475), or 30.7 per cent., injuries of the upper, and seventy-three thousand one hundred and six (73,106), or 33.8 per cent., injuries of the lower extremities, nearly approaching the percentages derived from the injuries of the American civil war.

TABLE CXX.

Tabular Statement of the Relative Frequency of Shot Wounds of the Different Regions of the Body.

OCCASIONS AND AUTHORITIES.	CASES.	HEAD, FACE, AND NECK.		TRUNK.		UPPER EXTREMITIES.		LOWER EXTREMITIES.	
		Cases.	Percentage.	Cases.	Percentage.	Cases.	Percentage.	Cases.	Percentage.
Revolution in Paris, 1830 (MÉNIÈRE,[1] JOBERT (DE LAMBALLE[2])	627	40	6.4	117	18.7	193	30.8	277	44.1
Revolution in Paris, 1848 (BAUDENS, HUGUIER, JOBERT (DE LAMBALLE[3])	413	46	11.1	77	18.7	116	28.1	174	42.1

Russo-Turkish War, 1876–77 (TILING,[25] KADE[26])	371	47	12.7	41	11.1	146	39.3	137	36.9
Totals	216,348	31,184	14.4	45,583	21.1	66,475	30.7	73,106	33.8
War of the Rebellion in United States of America, 1861–65	245,739	26,400	10.7	45,184	18.4	87,793	35.7	86,413	35.1
Aggregates	462,087	57,584	12.5	90,767	19.6	154,268	33.3	159,519	34.5

The excessively large percentage of wounds of the hands and fingers, frequently noticed by writers on military surgery, was also observed in the American civil war. Of thirty-

[1] MÉNIÈRE (P.) (*L'Hotel-Dieu de Paris en Juillet et Aout*, 1830, Paris, 1830, pp. 273 to 339) records 272 cases; 33 of head and neck, 80 of trunk, 51 of upper and 108 of lower extremities. [2] JOBERT (A.-J. DE LAMBALLE) (*Plaies d'Armes à Feu*, Paris, 1833) records, according to the tabular statement of L. SERRIER (*Traité de la nature, des complications et du traitement, des plaies d'armes à feu*, Paris, 1844, p. 30), 7 cases of head and neck, 37 of trunk, 142 of upper and 169 of lower extremities; total 355. [3] *Des plaies d'armes à feu. Communications faites a l'Académie Nationale de Médecine*, Paris, 1849: BAUDENS (pp. 224 *et seq.*), head and neck 15, trunk 26, upper extremities 40, lower extremities 51; total, 132. HUGUIER (p. 131), head and neck 24, trunk 31, upper extremities 36, lower extremities 41; total 132. JOBERT (A.-J. DE LAMBALLE) (p. 150), head and neck 7, trunk 20, upper extremities 40, lower extremities 82; total 149. [4] SIMON (G.) (*Ueber Schusswunden*, Giessen, 1851, p. 3), wounds of head and neck 15, of trunk 24, of upper extremities 37, of lower extremities 80; total 156. [5] DJÖRUP (M.) (*Om den relative Hyppighed af de forskjellige Skudsaar efter deres Sæde, og om deres Dödelighedsforhold*, in *Hospitals-Meddelelser*, Kjöbenhavn. 1852, Bind V, pp. 360–363), head and neck 934, trunk 982, upper extremities 1,767, lower extremities 2,516; total 6,199. [6] MATTHEW (T. P.) (*Medical and Surgical Hist. of the British Army, etc., in the years* 1854–55–56, London, 1858. Vol. II. pp. 257, etc.), and MCLEOD (G. H. B.) (*Notes on the Surgery of the War in the Crimea*, London, 1858. p. 414). [7] CHENU (J.-C.) (*Rapport, etc., pendant la Campagne d'Orient en* 1854–55–56. Paris, 1865. p. 657). LONGMORE (*Gunshot Injuries*. London, 1877. p. 607) erroneously cites the number of shot injuries of the lower extremities among the French in the Crimean War as 11,413, and of the upper extremities as 8,803; these numbers include shot

three thousand and sixty-four (33,064) instances of fracture and contusion of the upper extremities, including the articular portions of clavicle and scapula, eleven thousand three hundred and sixty-nine (11,369), or above one-third, were fractures of the bones of the hands and fingers. It has already been stated in *Note* 4, on page 435 of the *Second Surgical Volume*, that 27.8 per cent., or over one-fourth of the fifty-four thousand seven hundred and twenty-nine (51,729) shot flesh wounds of the upper extremities, were flesh wounds of the hand. It is possible that this large percentage is due to the increased exposure of the hand from almost constant movements over a considerable area, thus increasing the chances of intercepting missiles in their flight.

DEFINITION OF SHOT INJURIES.—All injuries caused directly or indirectly by missiles and projectiles impelled by the force of gunpowder or other explosive compounds have been included in the term "shot" injuries. They differ from the accidents common to ordinary life not so much in their essential character as in the peculiarity of the conditions and circumstances attending them, and on this account invite especial attention to the producing causes, to the dangers and complications liable to arise in their course, and to their management and treatment under conditions generally less favorable than are found in the practice of civil surgery.

A gunshot wound is essentially a contused wound, yet the character of the missile and the circumstances relating to the individual at the time of injury may impress upon it the additional features belonging to incised, lacerated, and penetrating wounds. In degree, it may range from trivial simplicity to all the terrible gravity of injury seldom seen but on the battle-field, yet in all its phases, simple or complicated, the application of the sound principles of general surgery forms the basis for treatment and marks the advance in the surgical science of the present day.

The great superiority of the rifled arm and cylindro-conoidal projectile, as compared with the smooth-bore arm and round ball, had been fully established by the experience of foreign nations in the great wars of Europe between the years 1848 and 1860. An interesting field of inquiry had thus been opened to the military surgeon regarding the modification of the nature of wounds resulting from the use of the improved firearms, and quite an extensive bibliography[1] on this subject had already been presented to the European pro-

as well as miscellaneous injuries. [8] BERTHERAND (A.) (*Campagnes de Kabylie*, Paris, 1862, p. 314). [9] WILLIAMSON (G.) (*Military Surgery*, London, 1863, pp. XXIV–XXVI). [10] DEMME (H.) (*Militär-Chirurgische Studien*, Würzburg, 1861, pp. 19, 20). [11] CHENU (J.-C.) (*Statistique Med.-Chir. de la Campagne d'Italie en* 1859 *et* 1860, Paris, 1869, T. II). The figures here given were obtained from a compilation of the tabular statements on pp. 424 to 836 of the second volume of Dr. CHENU'S work; the summary on p. 849 of his work includes the injuries of a miscellaneous character, which have been eliminated in this calculation. [12] MOUAT (*The New Zealand War of* 1863-64-65, in *Stat. San. and Med. Reports, for the year* 1865, London, 1867, Vol. VII, p. 477). [13] BINTOT (*Observations de blessures de guerre, etc.*, in *Recueil de Mémoires de Médecine de Chirurgie et de Pharmacie Militaires*, Paris, 1866, T. XVI. p. 42). [14] LOEFFLER (F.) (*General-Bericht über den Gesundheitsdienst im Feldzuge gegen Dänemark* 1864, Berlin, 1867, Erster Theil, p. 54). [15] MAAS (H.) (*Kriegschirurgische Beiträge aus dem Jahre* 1866, Breslau, 1870, p. 72), head and neck 12, trunk 41, upper extremities 50, lower extremities 109; total 212. [16] BIEFEL (R.) (*Im Reserve-Lazareth. Kriegschirurgische Aphorismen von* 1866, in LANGENBECK'S *Archiv für Klin. Chir.*, Berlin, 1869, B. XI. p. 371), head and neck 38, trunk 77, upper extremities 82, lower extremities 185; total 382. [17] STROMEYER (L.) (*Erfahrungen über Schusswunden im Jahre* 1866, Hannover, 1867, pp. 10, 11), head and neck 139, trunk 250, upper extremities 392, lower extremities 610; total 1,391. This volume contains articles by BAUDENS, ROUX, MALGAIGNE, AMUSSAT, BLANDIN, PIORRY, VELPEAU, HUGUIER, JOBERT (DE LAMBALLE), BÉGIN, ROCHOUX, and DEVERGIE. SIMON, *Ueber Schusswunden verbunden mit einem Berichte über die im grossherz. Militair-Lazareth zu Darmstadt behandelten Verwundeten vom Sommer* 1849,

fession. American surgeons had had but little opportunity to familiarize themselves with the active practice of military surgery, and were obliged to draw upon the authorities abroad for their early information, upon which was largely based the practice of the later surgery of the war.

FIREARMS AND THEIR PROJECTILES.—The reports of medical officers on the early engagements of the rebellion allude to the great diversity of missiles,[1] showing that every available weapon had been seized upon to arm the troops hastily thrown into the field; this was especially true of the Confederate troops. The northern forces were, perhaps, from the beginning, better, or at least more uniformly armed. Previous to the war a rifled musket adapted to the use of the minié projectile had been issued to the troops of the regular army, and distributed among the arsenals in the several sections of the country. Many of these fell into the hands of the Confederate government on the commencement of hostilities, and were appropriated to the use of their troops. Large numbers of arms of modern manufacture were purchased from abroad, principally of the Austrian, Belgian, and Enfield pattern, but inventive ingenuity, roused by the exigencies of war, soon superseded these by arms of domestic manufacture of great power and precision, among which breech-loading and magazine guns occupied prominent positions.[2]

[1] *Appended Documents*, Part I, Vol. I, p. 7; Assistant Surgeon C. C. Gray, U. S. A., in report of services at the first battle of Bull Run, Va., July 18, 1861, says: "The greater number of our wounded were injured by round musket balls; the wounds inflicted on the Confederates were of a graver character, a large proportion of them being caused by conoidal rifle balls and canister shot." At p. 10, Surgeon C. F. H. Campbell, U. S. A., in record of services at Falling Waters, Va., July 2, 1861, says: "Wounds were all from gunshot and principally of the lower extremities, produced by round musket balls, buckshot, and in one or two instances by sphero-conoidal balls." At p. 15, Assistant Surgeon Philip C. Davis, U. S. A., in report relative to the battle of Wilson's Creek, Mo., August 9, 1861, says: "The fire to which our men was exposed was principally from musketry at short range. The Confederates used the minié rifle, while the Missouri State Guards and the irregular troops were armed with smooth-bore muskets, western rifles, and double-barreled shot-guns—the last being very effective at short range." At p. 12, Surgeon A. B. Crosby, U. S. V., in report of the engagement at Ball's Bluff, Oct. 21, 1861, says: "Their [Confederate] cartridges generally contained a round ball and three buckshot." At p. 12, Surgeon J. A. Lidell, U. S. V., in a report of the same engagement, says: "The enemy had no artillery, and most of the wounds of our men were inflicted by round musket balls." At p. 22, Surgeon H. P. Stearns, U. S. V., in a report of the battle of Belmont, Mo., Nov. 7, 1861, says: "The enemy used both the smooth-bore muskets with round ball, shot-guns with ball and buck, and also rifles with conoidal ball." At p. 31, Surgeon J. H. Brinton, U. S. V., in an account of the campaign of the Army of the Tennessee from February to June, 1861, including the battle of Shiloh, says: "The nature of the wounds caused by the fire to which the troops were exposed at the battle of Shiloh was of the most varied kind; at times they were exposed to that of artillery both light and heavy, from which almost every species of projectile was thrown—solid shot, round and conical, grape and canister, spherical case and shell; at other times the fire was from musketry. The small arms used by the enemy were the improved rifle throwing conical balls, the western rifle, and the old-fashioned smooth bore musket; the cartridges for the latter were generally composed of ball and buckshot."

[2] The collection of missiles in the Army Medical Museum at Washington indicates the progress made in the United States during the years of the war in the improvement of firearms. Though by no means complete the series of unused missiles and projectiles on exhibition affords an interesting and

For the purpose of this history, projectiles common to warfare may be divided into those used with small arms, as rifles, muskets, pistols, etc.; those discharged from heavy ordnance, as cannon, both rifled and smooth-bore, mortars, torpedoes, etc.; those which acted indirectly in the causation of injury, as splinters, stones, and fragments, detached or set in motion by projectiles in their flight, and missiles of an unusual or eccentric character. By far the larger number of shot injuries were inflicted by missiles from small arms, as indicated in the following table:

TABLE CXXI.

Table indicating the Seat of the Injury and Nature of the Projectile in the Cases of Shot Wounds reported during the War.

SEAT OF INJURY.	Solid Shot.	Fragments of Shell.	Grape, Canister, etc.	Conoidal Ball.	Round or Musket Ball.	Pistol or Buck-shot.	Explosive Musket Balls.	Nature of Missile not ascertained.	Total Cases.
Shot Flesh Wounds of Scalp	3	867	15	2,612	521	119	2	3,600	7,739
Shot Injuries of Cranium	9	567	27	1,437	506	66	3	1,735	4,350
Shot Flesh Wounds of Face	5	572	19	2,632	296	160	31	1,199	4,914

The nature of the missile was ascertained in one hundred and forty-one thousand nine hundred and sixty one (141,961) cases, of which one hundred and twenty-seven thousand nine hundred and twenty-nine (127,929), or 90.1 per cent., were caused by missiles from small arms. The projectiles or missiles used with small arms resolved themselves into spherical balls, usually discharged from smooth-bore muskets, and those of an elongated form, adapted to rifled arms; the latter were either conical, cylindro-conoidal, or ovoid, varying in size, weight, and volume. The materials composing the missiles were usually lead

instructive study as to their varying forms, size, weight, and volume; this in connection with a series of over 500 projectiles extracted from wounds, together with the numerous preparations of fractures and wounded viscera in which the missiles producing the injuries have been preserved, affords opportunity for a comparison of the effects of the several missiles as well as for the study of the modification in gunshot wounds resulting from modern improvements in ordnance.

or lead hardened by an alloy of tin or antimony. The superiority of the elongated missile thrown from the rifled barrel over the spherical ball rests upon the fact that the elongated bullets usually have an expansive base, either plain or hollowed, which by the explosion of the charge is intended to fill the grooves of the rifle and give the projectile, as it is driven forward, rotation on its long axis, thus increasing its range and precision.

The cuts appended (FIG. 373) are designed to illustrate the general appearance of the more common and typical varieties of small-arm missiles used during the war by both contending parties:[1]

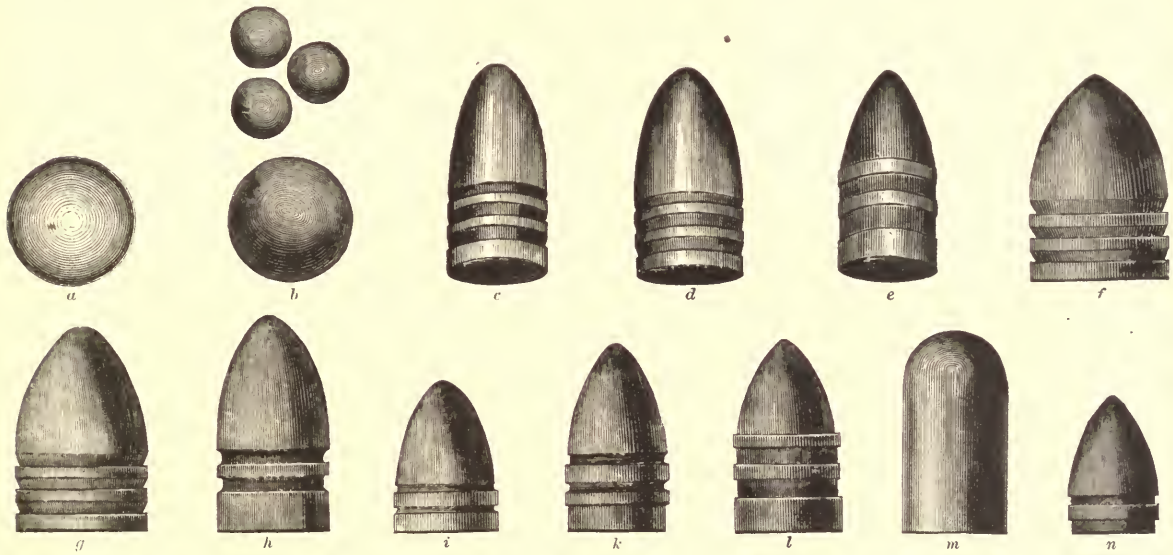

FIG. 373.—*a*. U. S. round musket-ball, calibre .69, weight 387 grains; *b*. Buck and ball, calibre .69, weight of ball 387 grains; *c*. Springfield rifled musket-ball, calibre .58, weight 500 grains; *d*. Enfield rifled musket-ball, weight 450 grains; *e*. Austrian rifle-ball, weight 460 grains; *f*. Elongated bullet, calibre .71, weight 675 grains; *g*. Elongated bullet, calibre .69, weight 760 grains; *h*. Elongated bullet, calibre .577, weight 517 grains; *i*. BURNSIDE rifle bullet, calibre .54, weight 400 grains; *k*. SPENCER rifle bullet, calibre .56, weight 434 grains; *l*. SHARP'S carbine ball, calibre .52, weight 450 grains; *m*. GREEN'S rifle ball, calibre .53, weight 575 grains; *n*. COLT'S army pistol bullet, weight 207 grains.

The large projectiles used with ordnance may also be classified under the headings spherical and elongated, the former being generally used with smooth-bore, the latter with rifled guns. Round shot are solid spheres of cast-iron varying in size and weight. A grape-shot (FIG. 374) is composed of a number of cast-iron balls (in the U. S. service generally nine) arranged in layers of three each and kept in position by a series of tables or plates which are held together by a vertical rod secured by nuts on each end; these missiles vary in calibre to fit guns of various sizes; at the discharge the several parts become separated and each part acts as a distinct projectile. They have a considerable range.

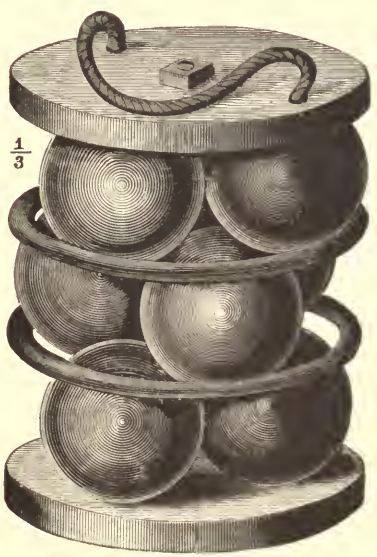

FIG. 374.—Grape-shot. *Spec.* 4596.

A canister shot is a projectile made by enclosing a large number of iron or leaden balls of less size than grape in a cylinder of tin, which is torn asunder at the discharge of the gun; the contents are scattered, assuming in their onward course something of the area of a cone; when used against masses of troops and at short range the canister shot is very destructive. Shrapnel shots are spherical or elongated.

[1] The number of varieties of missiles and projectiles on exhibition in the Army Medical Museum exceeds one hundred, embracing specimens of nearly all the latest inventions. Some of these were tested in actual warfare, while others, although constructed upon theoretical principles, were laid aside after a few trials; a detailed description of all these would be impracticable.

according to the character of the gun in which they are used, and when adapted to smooth bores they are designated spherical case shots. They are shells of considerable thickness, filled with musket balls consolidated into mass by a composition of sulphur and resin (Figs. 375, 376, 377), and are exploded by a charge of powder fitted into their interior, which is ignited, as may be desired, by a time or percussion fuze. They have a long effective range and are calculated to inflict serious injury by the great number of fragments set loose at their explosion.

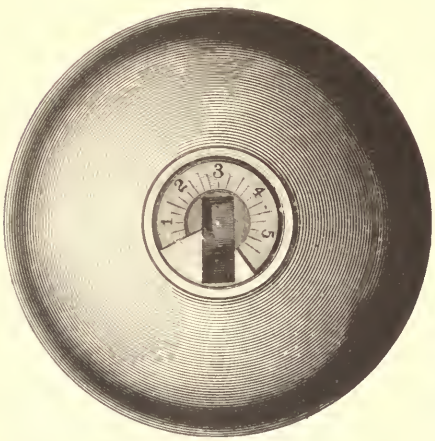

Fig. 375.—A 12-pounder spherical case-shot, outer and upper view. *Spec.* 4594. Half size.

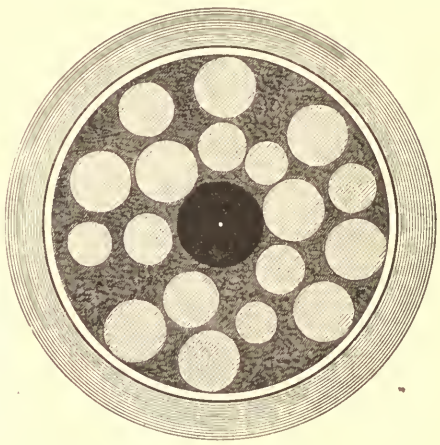

Fig. 376.—The same sawn in half, showing the bullets and composition. *Spec.* 4594. Half size.

The projectiles used in rifled guns exclusively combine with the properties and character of the projectiles just described those which pertain particularly to guns constructed on the rifled principle; they differ greatly in size and weight; their velocity varies with the calibre from 1,100 to 1,550 feet per second, and their range has exceeded five miles. The 10-pounder percussion Parrot case-shot illustrated in Fig. 378 is a missile of this nature. By the explosion the shell is rent into many fragments, varying in weight from a few grains to many pounds; these fragments are driven in all directions with great force and inflict injuries of the gravest character. The Museum collection is particularly rich in specimens of fragments of exploded shells of all sizes and descriptions, showing the great diversity of shape and form which these fragments may take.

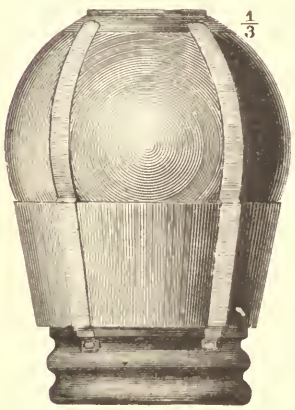

Fig. 377.—A spherical case-shot strapped for howitzer or gun. *Spec.* 4582.

Rifled projectiles are also cast solid, and are used for breaching or battering purposes.

Bolts, so called, are solid metal projectiles of elongated form, with surfaces so cut as to fit corresponding surfaces in the barrel of the gun; they are made to fit with great exactness, so that a greater proportional effect is attained with a smaller charge of explosive compound. The Whitworth gun and projectile may be taken as the type of this class. Its projectile has been thrown nearly six miles. It is probable that the extreme care necessary to preserve the surfaces of the gun and missile clean and smooth will render it practically less effective than many of the ordinary patterns of rifled ordnance which possess almost equal power, range, and precision.

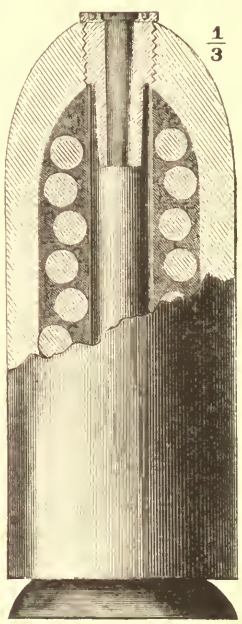

Fig. 378.—A 10-pounder percussion Parrot case-shot. *Spec.* 4587.

With this general knowledge of the more common forms of ordnance projectiles it will be unnecessary to enter more fully into a detailed account of the improvements made from time to time with the object of perfecting these agents of destruction.

Shells thrown from mortars differ little if any from ordinary spherical shells except in size and in the manner of projection. Their use is generally restricted to sieges. Under the same circumstances hot solid shot were used during the war, but with the intention of destroying property rather than human life.

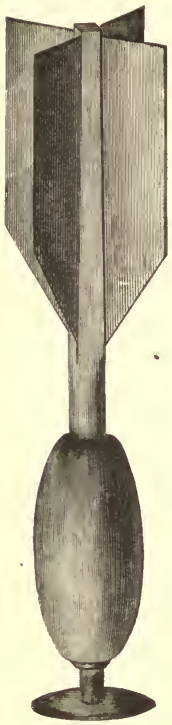

FIG. 379.—Ketchum's 1-pound hand grenade. *Spec.* 4593.

Hand grenades (FIG. 379) are small iron shells filled with powder and discharged by percussion; they were used in sieges and assaults at close quarter, and their effects are similar to ordinary shells; as their name indicates, they are carried and thrown from the hand.

Torpedoes, or more properly *fougasses*, were largely used as a means of defence during the late war; they were, as a rule, simply large shells arranged with levers connected with a percussion fuze and sunk below the surface of the ground in the supposed path of an assailing party. A pressure of the foot upon the concealed lever was sufficient to explode the shell, resulting in effects similar to the bursting of a like projectile under ordinary circumstances. Torpedoes of more complicated construction and of far greater power were employed in the defence of rivers and harbors and proved important and effective agents of destruction. In an article on torpedo wounds, Dr. S. W. Gross[1] describes a formidable engine of this character, containing about sixty pounds of gunpowder and capable of being exploded by a pressure of four pounds only. Dr. Gross adds that "its effects can readily be imagined."

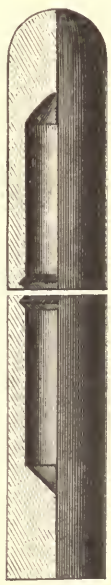

FIG. 380.—McCallum's bridge torpedo. *Spec.* 2569.

Surgeon J. B. Brown, U. S. A.,[2] Medical Director of the Fourth Army Corps, in an extract from a narrative of his service at Williamsburg, Virginia, reports that the enemy "had planted torpedoes in the works and along the road leading to Williamsburg, designing that they should explode by the pressure of the foot of those passing over them. A casualty occurred in General Casey's division from the explosion of one of these torpedoes and one man was killed and five wounded. The wagon track and the side paths for a mile were studded with these buried shells; but they were guarded, as soon as discovered, by men detailed to remain near them to point them out to passing troops. I passed near several of them and observed the ingenuity with which they were concealed." Surgeon D. W. Hand, U. S. V.,[3] in an extract from a report relative to operations in North Carolina, relates that on "June 4, 1864, two large torpedoes were accidentally exploded at Bachelor's Creek, an outpost of New Berne, instantly killing thirty-six soldiers and eight negroes and seriously wounding twenty-nine men attached to the 132d New York Volunteers."

A bridge torpedo, devised by McCallum, designed to be placed in an auger hole in the beam of a bridge, is represented in FIGURE 380. The two sections are joined by a percussion cap connected with a lever placed under one of the planks of the bridge; slight pressure is sufficient to explode the torpedo.

In a third division of missiles and projectiles are included such as cause wounds and injuries indirectly: splinters, stones, fragments, or foreign bodies set in motion or driven by the force of projectiles in their course, and which frequently by their action or lodgement

[1] GROSS (S. W.), *On Torpedo Wounds*, in *American Journal Medical Science*, 1866, Volume LI, page 370.
[2] APPENDIX to Part I, Vol. I, *Medical and Surgical History of the War of the Rebellion*, page 67.
[3] APPENDIX to Part I, Vol. I *Medical and Surgical History of the War of the Rebellion*, page 239.

complicate direct shot wounds, and which are themselves sources of danger and of uncertainty in diagnosis. The most common examples of this class are fragments of stone and splinters of wood torn from the earth or from trees, and from structures forming defensive works, scraps of iron or metal from ordnance, firearms, or from articles of equipment; or indeed from any object with which projectiles come in contact.

In the class of unusual or eccentric projectiles the missile illustrated in FIGURE 381 may be placed; it is a conoidal leaden shell two inches in length, one and a half in calibre, weighing nine and three-quarter ounces. The missile was cut out of a horse killed while the rider was reconnoitering with General Kearney on the day of the second battle of Bull Run. No report was heard from the direction in which it came. It was subsequently learned that such missiles were fired from globe-sighted rifle-guns of some thickness. FIGURE 382 represents what is known as a ricochet shell, picked up on the battle-field of the Wilderness in 1865 by Captain James M. Moore, U. S. A., and presented to the Army Medical Museum; it is of peculiar form, weighing nine and one-half pounds; it has a shallow narrow excavation at the head, apparently designed for a charge and percussion cap, which charge seems to have proved insufficient to burst the missile. They are said to have been commonly used by the Confederates at the battle of Fredericksburg, at the battle of the Wilderness, and on other occasions.

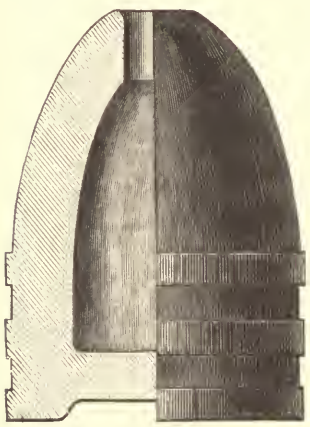

FIG. 381.—Leaden shell 2 ins. in length, 1½ inch calibre, weighing 9¾ ounces. *Spec.* 3294. [Natural size.]

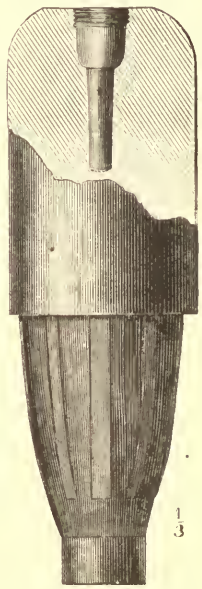

FIG. 382.—Elongated percussion shell. *Spec.* 4765. ⅓

It is stated that railroad iron cut into suitable lengths, spikes, and scrap-iron were used by the Confederates in lieu of regular projectiles. No specimens of such missiles are in the Museum collection to substantiate this statement.

Shaler's sectional bullet, represented in FIGURE 383, is drawn of natural size and weighs 608 grains; it is designed to part in its flight, forming three separate missiles; whether it was ever used on the field is not known.

The ordinary "buck and ball," FIGURE 373, *b*, p. 697, a compound missile, was very extensively used during the early part of the war; it consists simply of the ordinary round ball, calibre .69, and three buckshot enclosed in the same cartridge. Cartridges made up entirely of buckshot were common and at close range made very effective missiles. Slugs and fowling-piece ammunition are also noted as having been occasionally used.

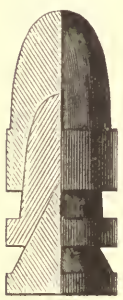

FIG. 383.—Shaler's sectional ball. *Spec.* 4621. No. 36.

A peculiar missile, said to have been thrown into the prison camp at Johnson's Island with a message attached, is shown in FIGURE 384. It is a conoidal bullet with a spade-shaped appendage twice its length, designed to render the course of the projectile more accurate. It is believed to be a pattern rejected by the Ordnance Department about the year 1860; its history is not positively known.

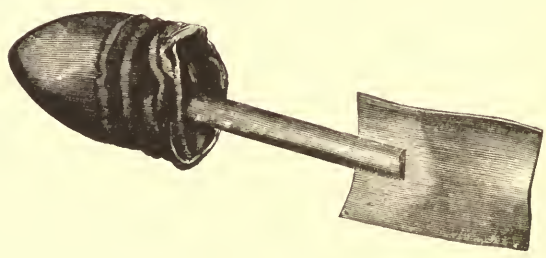

FIG. 384.—Bullet with guiding (?) attachment; actual size. *Spec.* 4610.

"Greek fire" for incendiary purposes was employed, probably by both sides in a few instances. It was used at the siege of Charleston, in 1863;[1] but its employment led to such representations respecting its barbarity that the use of it was but little resorted to, if at all, during the remainder of the war.

A small quantity of composition, a portion of the contents of a fire-ball used by the Confederates and captured at Morris Island, was contributed to the Army Medical Museum by Acting Assistant Surgeon H. K. Neff. It is specimen 572 of the *Surgical Section*, and is described as "a mixture of nitre, sulphur, and antimony, and when used is made into a paste with sand and rosin. The missile was wrapped on the outside with three layers of heavy canvas, tarred and pitched without, with a network of twine over it. The bottom was cast-iron covered only with pitch. Within the ball was a tin cup to which the canvas and twine were fastened, and which contained the composition, and near the base was embedded a 6-pounder shell. Three pins in the top are withdrawn before loading in the gun to allow ignition previous to its exit from the muzzle. The composition burns slowly with intense heat. The missile was designed to be thrown from a mortar." Except in the instances quoted it is doubtful if the use of this agent was at all common.

EXPLOSIVE BALLS.—The subject of the employment of explosive missiles in warfare between civilized nations has been largely discussed from an ethical point of view, particularly since the civil war in the United States. While their use is acknowledged to savor of barbaric warfare, there is still a manifest reluctance to place them entirely beyond the pale of legitimate employment.

By an agreement between the principal nations of Europe, signed by their representatives at an international military conference held at Saint Petersburg in October, 1868, it was resolved to abstain from the use of explosive projectiles under the weight of four hundred grammes. In commenting on this agreement, Dr. Longmore[2] remarks that "notwithstanding the International agreement just referred to, there is great misgiving on the part of many as to the abandonment of explosive bullets in time of war. The government of the United States has not joined the convention, and the treaty is only obligatory upon the contracting parties when at war between themselves; it also ceases to be obligatory in case of a power which has not joined the convention allying itself to either one or other of the belligerents. The English government of the day was greatly blamed by the press and by many military men for joining the treaty."[3]

One hundred and thirty cases of wounds attributed to explosive missiles were recorded on the returns (TABLE CXXII, page 696, *ante*). The records of the Ordnance Office, U. S. Army, show that thirty-three thousand three hundred and fifty (33,350) Gardner's "explosive bullets" or "musket shells" were issued to the troops in the early part of the war; that

[1] LONGMORE (T.), *Treatise on Gunshot Wounds, their history and treatment*, London, 1877, page 51. [2] *Ibid*, page 48.

[3] For the information of those who have never seen the treaty alluded to above the text is here reproduced from the work just quoted: "Considering that the progress of civilization ought to have the effect of lessening as much as possible the calamities of war: That the only legitimate object that states ought to propose to themselves during war is to weaken the military strength of their enemies: That for this purpose it is sufficient to put *hors-de-combat* the greatest number of men possible: That this end would be overpassed by the employment of arms which would uselessly aggravate the wounds of men placed *hors-de-combat* or that would render their death inevitable: That the employment of such arms would be consequently contrary to the laws of humanity: The undersigned having received the orders of their governments in this respect are authorized to declare as follows: § 1. The contracting powers mutually bind themselves to renounce, in case of war among themselves, the employment by their land or sea forces of all projectiles charged with explosive or inflammable matters of a less weight than 400 grammes. § 2. They will invite all the states which have not sent delegates to the military international commission at St. Petersburg to accede to the present engagement. § 3. This engagement is only obligatory upon the contracting or acceding parties in case of war between two or more of themselves: it is not binding in regard to parties who have not joined the convention. § 4. It will equally cease to be obligatory from the moment when in a war between powers which have joined the convention, another power, not a party to the convention, shall join one of the belligerents. § 5. The contracting and acceding parties will come to a further understanding among themselves every time that a precise proposition shall be made on the subject as regards future improvements that science may make in the arms of troops, so that the principles which they have laid down for reconciling the necessities of war with the laws of humanity may be maintained."

of these over ten thousand (10,000) were abandoned on the field for want of transportation. It is probable that the latter fell into the hands of the Confederates, accounting in a measure for the wounded before alluded to; but many reports of wounds attributed to explosive balls were made in which it is doubtful if the missile was really of this nature, as under certain circumstances the ordinary ball is capable of great distortion and of inflicting severe injury.

The extent of the damage from explosive missiles is greater than that ordinarily caused by the simple projectile; bony structures are more extensively shattered and the area of destruction in soft parts is larger; hæmorrhage, both primary and secondary, is more common; extensive sloughing follows, and the course of repair is slow and tedious.

The Gardner "explosive bullet" or "musket shell" (FIG. 385), referred to as having been issued to the United States troops, is a cylindro-conoidal projectile of lead, made in two sizes; the larger of calibre .58, weighing 451 grains, the smaller of calibre .54, weighing 363 grains. Within the interior is placed an accurately fitting acorn-shaped chamber filled with fulminate, and communicating with a one and one-quarter time-fuze, which is exposed to the charge at the rear of the missile; the fuze is ignited by the discharge of the piece. The bursting charge is sufficient to rend the bullet and transform it into a jagged dangerous missile. Should it have penetrated the body before exploding its effects are still more destructive. It is claimed that other forms of projectiles of this nature were used provided with a percussion cap which would explode upon contact with even soft tissues. No specimens of this kind are *found* in the collection of the Army Medical Museum.[1] The appearance of an exploded musket shell extracted from the thigh of a private of the 120th New York Volunteers is shown in FIGURE 386. The wound resulting was a flesh wound of the muscles of the thigh, and the bullet was removed by enlarging the opening of entrance.[2]

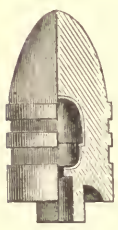

FIG. 385.—Gardner's explosive ball. *Spec.* 4621.

FIG. 386.—Explosive ball extracted from thigh. *Spec.* 4561.

Six well authenticated cases of injuries from explosive balls have already been cited;[3] accounts of sixteen cases of alleged injuries from similar cause are here appended:

CASES 1028–1043.—Private Joseph Baker, Co. B, 29th New York, wounded at Bull Run, August 29, 1862. Acting Assistant Surgeon W. L. Hammond reported the patient's admission into Baptist Church Hospital, Alexandria, September 1, 1862.

[1] There are, however, on exhibition several specimens of centre-fire metallic cartridges for a breech-loading rifle .35 calibre, loaded with explosive bullets, contributed by Major-General M. C. MEIGS, Quartermaster General U. S. A., and Surgeon H. R. TILTON, U. S. A., and found in the camp of Chief Joseph's band of Nez Perces, in 1877, after their surrender to General Miles. The projectile is represented in FIG. 387. A copper shell nearly three-tenths of an inch in length, loaded with fulminate, is enclosed in a boring at the head of the bullet; the end of the shell projects sufficiently to act as a percussion cap by which the missile is exploded. The following extracts from a letter from Surgeon H. R. TILTON, U. S. A., give some interesting facts in connection with this and another form of explosive missile: "Fort Riley, Kansas, April 3, 1881. Surgeon D. L. HUNTINGTON, U. S. A., Washington, D. C. DEAR DOCTOR: In reply to your note of enquiry about explosive balls used by the Nez Perces, I will give you such information as I have. During the siege, which lasted five days, I was disposed to doubt that the Nez Perces had any explosive balls, although several men insisted that they had been struck by them, as they distinctly heard the explosion. One man of the 9th Cavalry was shot through the thigh in front of the femur; the skin was discolored, and the hole was large enough to admit the thumb; there was only a bridge of skin. After the surrender and discovery of explosive balls in the village, I was convinced that a number of the wounds had been caused by explosive balls. . . . I was curious to know how the Indians had obtained these explosive balls, and heard upon enquiry that in passing through Idaho they had made a raid upon a 'ranch' of an Englishman who had hunted in all parts of the world, and who was well supplied with rifles and ammunition, including explosive balls, and the Nez Perces had captured his outfit although he escaped. . . . I have an impression that explosive balls, like other balls, cause a larger wound at the point of exit than at the point of entrance, although explosive balls and 'Express' rifle balls greatly lacerate the tissue before their exit. My attention having been drawn to the subject, I found that a citizen employé with the 7th Cavalry had explosive balls for use in hunting. The Winchester rifle ball was cast with a cavity of proper size to receive a .22 calibre cartridge in its apex; the .22 calibre cartridge required a portion of its ball to be removed in order to fit into the .44 calibre ball. I saw the effect of these on antelope, and the laceration was beyond the point of entrance. Very respectfully, H. R. TILTON, Surgeon U. S. A."

FIG. 387.—Explosive bullet *Spec.* 914.

[2] The case has already been referred to, as a case of flesh wound of the lower extremities, in *Note* 1 of page 24, *ante*.

with a wound of the right thigh, inflicted by an explosive ball, which entered the internal femoral region, centre of the middle third, fracturing and comminuting the femur; ball extracted on the battle-field, under the fascia lata, between the rectus and the vastus externus, almost in the line of its direction. Treated in Smith's anterior splint; union of bones with considerable curvature externally; limb shortened 2½ inches and foot inverted. Discharged February 29, 1863.—Lieutenant C. M. Ball, Co. G, 141st Pennsylvania, aged 35, wounded at Chancellorsville, May 3, 1863, by what he thought was an explosive ball, which entered the left leg in the upper portion of its lower third, inner and posterior aspect, and produced two wounds in its exit, one on the posterior and the other on the anterior aspect of the leg; fragments of bone discharged. This officer was discharged from service December 9, 1863, and pensioned, and paid in September, 1866, since which time he has not been heard from.—Private M. Conner, Co. D, 102d Pennsylvania, aged 30, wounded at Cold Harbor, June 3, 1864, by an explosive ball, which injured the right malleolus; extraction of missile; admitted into Third Division Hospital, Alexandria. Discharged from service Jan. 7, 1865.—Private W. Bohmer, Co. D, 26th Wisconsin, wounded at Resaca, June 22, 1864, by an explosive ball, causing transverse fracture of alveolar process of superior maxilla, removing teeth of left side to molar and on right to bicuspids; fistulous opening into nose. Treated at Harvey Hospital, Madison, and returned to duty November 19, 1864.—Sergeant D. S. Durell, Co. E, 3d New Jersey, was admitted into Turner's Lane Hospital, Philadelphia, August 28, 1863, with a wound of the right leg, caused by an explosive conical ball, at Chancellorsville, May 3, 1863. The ball struck the upper third of the right tibia anteriorly, making but one orifice. Portions of the missile were said to have been extracted in camp at Washington and at West Philadelphia hospital. Discharged from service January 23, 1864. Reported by Acting Assistant Surgeon George Hutton.—Sergeant J. L. Fenton, 9th Massachusetts Battery, aged 28, was admitted into Jarvis Hospital, Baltimore, July 10, 1863, with a wound of the right leg, inflicted by an explosive ball at Gettysburg. Acting Assistant Surgeon B. B. Miles reported that when admitted the patient had typhoid symptoms, and on the night of July 27th had a slight hæmorrhage. He died on July 28, 1863, with supposed pyæmia. An autopsy revealed the knee joint and thigh infiltrated with pus, and a compound comminuted fracture of the tibia. The specimen of the upper third of the right tibia, showing superficial necrosis around the injury on its posterior aspect, was contributed to the Army Medical Museum by Assistant Surgeon D. C. Peters, U. S. A., and is numbered 1613 of the *Surgical Section*.—Sergeant O. V. Gingrass, Co. A, 29th Missouri, wounded at Ringgold, Georgia, November 24, 1863. At the general field hospital at Chattanooga the wound was recorded as a gunshot fracture of left malar bone and superior nasal bone by a conoidal ball. He was subsequently treated at hospitals in Nashville and Louisville, and on June 25, 1864, was admitted into the hospital at Jefferson Barracks, Missouri. Surgeon J. F. Randolph, U. S. A., reported that an explosive ball entered two inches forward and one and a half inches above angle of inferior maxilla, emerging at nose, exploding as it passed out, tearing away body of superior maxilla and entire nose and destroying left eye. The patient was transferred to St. Louis and discharged July 14, 1865.—Private Charles G. Hall, Co. G, 5th Maine, aged 36, was wounded at the Wilderness, May 10, 1864. On May 14th he entered Carver Hospital, Washington. Surgeon O. A. Judson, U. S. V., reported: "Gunshot wound of left side of pelvic region, flesh. Explosive ball entered body near anterior inferior spinous process of ilium and lodged in the same side near the sacrum. May 10th, extraction of ball on field; simple dressings. Doing well June 26, 1864, when he was returned to regiment to be mustered out."—Acting Assistant Surgeon D. C. Owen reported that Private James Kenney, Co. I, 100th Illinois, aged 18, was admitted into the hospital at Quincy, Illinois, December 26, 1863, with a gunshot wound of the right shoulder by explosive ball, received at Missionary Ridge, November 25, 1863. Ball entered half way between the shoulder joint and neck and penetrated the flesh two and a half inches; extracted from place of entrance; wound healed. Returned to duty February 16, 1864.—Private T. P. McElroy, Co. F, 81st Pennsylvania, aged 46, wounded at Spottsylvania, May 12, 1864. Treated in Washington and Annapolis hospitals, and admitted, on August 18, 1864, into hospital at York, Pennsylvania. The following record of the case appears upon an unsigned case-book: "An explosive ball struck the lower jaw on the left side of the chin, bursting and comminuting the bone. The ball was removed by Dr. Vanderkieft, surgeon-in-charge of the Naval Academy Hospital, on May 21, 1864. Several fragments of bone were removed at the same time and several had come away before. The wound is now healed externally but discharges slightly into the mouth." McElroy deserted from hospital October 14, 1864.—Private P. F. Moore, Co. B, 83d New York, aged 40, wounded at Tolopotomy Creek, Virginia, May 30, 1864. On June 4, 1864, he was admitted into Mt. Pleasant Hospital, Washington, where the injury was diagnosed as "arm poisoned by explosive ball." He was afterwards treated in hospital at Bristol and Philadelphia, but no subsequent allusion is made to the character of the missile.—Medical Cadet E. D. Mitchell reports: "Bugler Jack Robinson, 1st U. S. Cavalry, was killed at Brandy Station, August 1, 1863, and by order of General Buford his body was sent to Washington for interment. Autopsy August 2d, one hour after admission into Douglas Hospital. The ball entered over inner third of right clavicle, fracturing it, wounding the apex of the right lung, and passed out obliquely, striking the seventh cervical vertebra, and was cut out underneath the skin near the inferior angle of the scapula. The lung was too much decomposed to make a preparation of. The ball had evidently exploded after it struck him. There was a great amount of hæmorrhage, but the body was too much disorganized to allow of finding its seat. The specimens are the clavicle and ball." The specimens were received at the Army Medical Museum, and the clavicle is numbered 1644 of the *Surgical Section*, but the missile is not attached and a careful search failed to discover any trace of it.—Private John Ryan, Co. E, 114th Illinois, aged 21, wounded at Guntown, Mississippi, June 10, 1864, and admitted into Adams Hospital, Memphis, June 13th. Surgeon J. G. Keenon, U. S. V., reported: "A lacerated wound, from explosive shot, of calf of right leg. June 17th, extraction of ball through extension of opening; calf of leg appeared as if peppered by buckshot. Ball had exploded after entering limb. June 30th, gangrene attacked the wound and was checked with bromine. On August 25th the patient was transferred to Quincy, Illinois, and discharged June 22, 1865."—Private W. H. Stanley, Co. C, 1st Maine, aged 21, was admitted into Chestnut Hill Hospital, Philadelphia, June 7, 1864, with a gunshot wound of left foot, received at Spottsylvania May 19, 1864, said to have been inflicted by an explosive ball. Simple dressings were applied, and the patient was returned to duty July 11, 1864.—Acting Assistant Surgeon Louis Fassitt reports: "R. C. Wright, 1st U. S. Chasseurs, was wounded on the skirmish line at Malvern Hill, July 1, 1862, by an explosive ball, which entered about the middle of the right clavicle, fracturing the bone, passed through the cavity of the thorax, and was extracted four days after below the spine of the right scapula. Large amount of hæmorrhage from the lungs. Sensation at the time of receiving the

wound was like that of a 'blow from a man's fist.' Admitted into hospital at Chester, Pennsylvania, July 29th. Several pieces of brass were extracted by me from the anterior wound near the clavicle, and others from the posterior wound near the scapula. (He had no scales on his shoulders or any metal about his person.) These form a portion of an explosive cap attached to a conical ball, which I have no doubt ignited at the moment it struck the clavicle, and these fragments were driven through the lung." Wright was discharged from service November 30, 1862.—Private A. Farey, Co. C, 183d Pennsylvania, aged 35, wounded at Cold Harbor, June 3, 1864. Acting Assistant Surgeon J. A. McArthur reported from South Street Hospital, Philadelphia: "Wounded by an explosive ball, which entered the right side of the thorax one and a half inches from the acromion. On June 12th a large abscess which had formed over the biceps muscle was opened and the ball extracted." Erysipelas attacked the wound and the patient died July 22, 1864. At the autopsy the ball was found to have passed through the glenoid cavity of the scapula, partially fracturing the head of the humerus, and passing around the bone lodged beneath the fascia covering the biceps muscle. The upper half of the right humerus was forwarded to the Army Medical Museum by Dr. McArthur, and constitutes specimen 3669 of the *Surgical Section*. There is a double longitudinal partial fracture of five inches on the inner side of the shaft. The head is carious, and necrosed bone borders the lines of separation in the shaft.

EFFECTS OF LARGE PROJECTILES.—The effects of these projectiles depend on their weight, size, and momentum. At high velocities they virtually encounter no resistance from a single human body and their force is but slowly expended on masses of soldiery. Their form is of little importance, as similar results follow the use of spherical and elongated solid shot and shell; their impact is followed by instant death or by wounds of great severity.

When the injury is not immediately fatal, as is not rarely the case when a limb is carried away by a projectile of considerable size striking directly, the surface of the stump will be found to be somewhat "cleanly cut," the skin and muscular tissues contused and dark with but little retraction; the bone fractured with not much splintering or comminution above the seat of injury; the arteries retracted and the hæmorrhage slight. If the projectile strikes obliquely or with somewhat diminished force, the resulting wound resembles a deeply grooved furrow corresponding to the size of the projectile and influenced by its direction; the skin, fasciæ, and deeper soft parts are extensively lacerated or removed entire, the surface is covered with blood clots and shreds of connective, muscular, and aponeurotic tissue; if penetrating cavities, disorganization and destruction of the parts will follow, resulting in death either immediately or in a very short time. Should a large projectile come in contact with a limb under these circumstances, it may carry it away entire or leave it partially attached by fragments of skin and muscular tissue; in its midst will be found fragments of shattered bone, the whole forming a mass devoid of form and life. An illustration of a laceration of the leg from a cannon ball is given in PLATE LXXVI, opposite page 478, *ante*. The lithograph is copied from a sketch made on the field.

A solid projectile whose velocity is so greatly diminished as to seem harmless is still capable of doing great damage through its acquired momentum; it may not possess the force necessary to carry away any part of the body, but a contusion or wound resulting from its impact is generally serious and not infrequently fatal. It may be that no outward evidences of injury are manifest beyond some discoloration, but subsequent symptoms indicate the existence of grave internal lesions, rupture of viscera, concussion of the brain or spinal cord, and sometimes fracture of bones with extensive comminution and disorganization of the surrounding soft parts. The following case of fracture of the humerus in three places, leaving the skin intact, taken from a report of his personal service at the battle of Bull Run, is related by Assistant Surgeon B. E. Fryer, U. S. A.:

CASE 1044.—"A Sergeant of Rickett's Battery walked from the field to the hospital after having been struck by a round shot, *en ricochet*, on the arm, fracturing the humerus in three places and producing great contusion without breaking the skin. The case is interesting from two facts—the great injury to the bone without laceration of the surrounding soft parts, and from the fact that disorganization of the tissues did not take place in this, as it nearly always does in all parallel cases. The result of the treatment of this man was doubtful, and the question of amputation was raised by the other medical officers of the hospital, but I strenuously opposed it, and had the satisfaction of seeing this useful soldier recover and return to duty with no other deformity than a slight shortening, and with a perfect use of the arm. The treatment in this case was to lay the arm on a pillow; cold water until all swelling had subsided, after which I ordered a plaster of Paris splint."

In the next case the femur was fractured at the neck and the soft parts were severely bruised, but the skin was not broken:

CASE 1045.—Surgeon James T. Stewart, 64th Illinois, aged 40 years, was wounded at Decatur, Georgia, July 19, 1864. The following history of his case was kindly furnished by this officer: "While acting in the capacity of Surgeon-in-Chief of the 4th division, Sixteenth Army Corps, near Decatur, I was struck by a spent shell on the right hip. The shell came from the side, struck me fairly on the hip and fell down, not exploding. It crushed the soft parts dreadfully and broke the thigh bone in the neck. The skin was not broken, but everything underneath it was bruised into a jelly. I was laid on my left side as I could not lie on my back, the wounded leg resting on the sound one with a pad between them. In this position I lay for two or three months, with no extension or counter extension or apparatus whatever, as I could not bear any. I remained on the field for three days and was sent in an ambulance to the field hospital a distance of about four miles. I lay there three or four days, and had to be moved about four miles further to the right. This time four men carried me on my cot, and while on the way the end of the cot came off suddenly and threw me off in the road. I survived the shock, but it was all I could do; I lay in this field hospital perhaps about ten days, when I was put in an ambulance and carried back to Marietta, some twenty-two miles. Here I lay, I think, about a month. At the end of this time, there being no union of the bone whatever, I prevailed on them to start me for St. Louis for the purpose of getting under the care of Professor Pope. I went as far as Nashville, but could ride no further, hence I was put in the hospital there. After a week they put me on a train for Louisville. In consequence of exhaustion I was obliged to stay in Louisville, in hospital, probably ten days, when I was put on a steamboat for Cairo, but the boat was stopped at Evansville in consequence of a raid the Rebels had made on the river below; but after a week or so went on, and finally arrived safely at Cairo, was transferred to another boat, and eventually reached St. Louis. Professor Pope examined the leg, and told me the bone was uniting and that he would not advise any change in the treatment. On this advice I came to Peoria. As to the result, the leg is shortened one inch. There is quite a hollow where the trochanter major should be. The leg is weak and most of the time sore and tender in the hip. It does not often give me pain. I can walk with a cane pretty well, but without a cane it gives out in a few squares. For six or seven years after the injury it improved, since then it has rather grown worse and gives me more trouble now than it did ten years ago." Dr. Stewart was mustered out December 22, 1864, and pensioned. Examiner G. L. Lucas, of Peoria, reported September 4, 1877: "That no improvement had taken place since last examination."

Slighter contusions very generally destroyed the vitality of the skin and soft tissues and resulted in extensive sloughing and slow repair. The occurrence of simple fracture and dislocation was noted, but these complications were infrequent.

Probably the largest class of injuries attributable to heavy projectiles is that resulting from fragments of exploded shells. The nature and character of these wounds are largely influenced by the weight, form, and velocity of the fragments. Pieces of great weight moving with high velocities inflict injuries similar to and not less severe than those caused by the large projectiles already mentioned. As their velocity diminishes, which is rapidly the case, owing to the great resistance offered by the air to the passage of irregularly shaped bodies as well as to gravitation and modification of the original impetus, the factor of weight alone assumes importance, as even with slow motion the momentum of such masses is almost irresistible. Form may determine the severity of a wound—especially when the fragment is of a small size, the sharply outlined edges becoming sources of danger to blood-vessels, nerves, and viscera.

Wounds from large shell fragments are attended with great laceration and destruction. When the force has been insufficient to carry away a portion of the trunk or an extremity, the resulting wound is deeply contused with ragged and irregular edges; there may be a loss of more or less substance; bony structure exposed to the force of the blow is shattered and comminuted; not infrequently the missile will be found lodged in the wound. In other cases a large fragment will pierce the skin without destroying the vitality and sink deep into the cavities or soft parts; the skin retracting will present so small an opening as to obscure the diagnosis until subsequent symptoms disclose the true nature of the injury. As in cases of solid shot, contusions of little or no outward significance beyond slight bruising, but attended with extreme internal disorganization, are met with. Shell fragments striking obliquely, as often happens when the missile explodes on the ground, generally produce superficial wounds only, though covering an extensive area. A curious case of

lodgement of a 12-pound unexploded shell in the gluteal muscles appears upon the records of the field hospital of the Eighteenth Army Corps:[1]

CASE 1046.—Private B. D. Thayer, Co. D, 25th Massachusetts, aged 21 years, was wounded at Petersburg, June 30, 1864, and was taken to a field hospital of the Eighteenth Corps, where it was reported that Surgeon H. N. Small, 10th New Hampshire, removed a 12-pound round shell from the left gluteal region, the patient surviving the operation some forty-eight hours. The missile, which was retained by the operator, was entirely concealed behind the gluteal muscles.

Wounds by grape-shot partake of the general nature of injuries from cannon balls. The velocity of these projectiles is, however, generally lower, and their weight less, so that their destructive power is somewhat limited. Case and canister shot, as well as small fragments of shell, produce effects not materially differing from those of small-arm missiles.

The effects resulting from the explosion of torpedoes, though somewhat dependent upon their size, nature, and proximity, are extremely terrible. Not only is the violent action of fragments and splinters hurled at their initial velocity to be considered, but also the consequences of exposure to the flame and gas of the exploding charge. Should life be not immediately extinguished, fearful mangling and mutilation results, and limbs may be entirely torn away or shattered almost beyond recognition, while the presence of burns and the effects of the inhalation of gases serve to complicate and obscure the condition.

Although it has been previously stated in this history (see *Second Surgical Volume*, page 28) and elsewhere that "reports of alleged traumatic effects from the wind of balls * * * do not seem to merit serious consideration," it would appear by the number of reports of cases of this character during the late war, that there is still a lingering belief that injuries from this source are not of infrequent occurrence. After a careful consideration of these reports the evidence unmistakably points to effects produced by actual contact of the missile causing severe concussion, or to the accident known as the "brush of a ball," in which the missile passes so near as to actually touch the clothing or skin without tearing the one or the other, and producing apparent paralysis, swelling, inflammation, and sloughing.

The several theories of vacuum,[2] of foreign bodies carried along with the ball,[3] and of electricity,[4] which have from time to time been suggested to support the idea of injuries

[1] Descriptions in detail of injuries caused by solid projectiles or large fragments of shell, together with illustrations, have been given in the preceding parts of the history. On page 91 of the *First Surgical Volume* it was pointed out that, "without any attendant injury to the skull or concussion of the brain, the scalp may be wounded by the largest projectiles from artillery," and that "cleanly-cut furrows were made . . . by fragments of shell in rapid flight." A case of contusion of the occipital by a 6-pound iron cannon ball is cited on page 99, and instances of crash or smash produced by cannon balls or explosion of large shells are given on pp. 212–214. On pp. 476–477, remarks on and cases of injuries to the contents of the chest by large spent shot and fragments of shell will be found; see also case of H. B——, on p. 487, and on p. 486 the case of C. P. Betts, injured by grape-shot. In the *Second Surgical Volume* visceral injuries without external wounds are referred to on pp. 15–28. The cases of Howard, p. 16; Charles G——, p. 18; Loveland and Dulephn, p. 20; five cases on p. 21; cases of Bishop, Bence, Brown, Rand, and Bowditch, on p. 23; of Williams, on p. 24; and the cases on pp. 25, 26, were all from solid shot or shell fragments. Case 649, p. 223, of fracture of the os innominatum by a shell fragment, is illustrated by a plate. *Specimen* 4457, a fragment of shell extracted from the ischiatic region, is illustrated by a wood-cut and referred to at p. 240. An illustration of a shell fragment extracted from the sacrum is given on p. 250, CASE 732. A portion of hand grenade, extracted from bladder by lithotomy, is illustrated in PLATE VII.

[2] FORBES (P.) (*Observations on the Cause of Death from what is called the Wind of a Ball*, in *The Edinburgh Medical and Surgical Journal*, 1812, Vol. VIII, p. 310) is of the opinion "that there is a mechanical cause for the effects produced by a ball passing close to the human body which will sufficiently account for them. This is the vacuum produced by the rapid motion of the ball through the air, which though of itself partial, yet when we combine with it the condensation of air taking place immediately before the ball, may, I suppose, have fully the same effect as if the vacuum behind it were complete. When a ball then passes close to the stomach, there is, in the first place, a great addition to the pressure on that viscus from the condensation of the air; as soon as the ball is passed, this pressure, with a great part of that of the atmosphere, is taken off; the consequence of which is a sudden expansion of all the fluids in the stomach and the blood in its blood-vessels, and the rupture of both. The rupture of the stomach is the cause of death, and the extravasation of the blood, of the black appearance, externally, . . . on the same grounds an easy answer is afforded to the question proposed by Dr. SPENCE, why the passage of ball has not always the same effect in battle? This arises from want of the necessary velocity to produce the condensation and vacuum which has been considered as the cause of the effects produced, as great velocities we know from the experiments made with cannon balls are rapidly destroyed by the resistance of the air."

[3] SPENCE (J.) (*Observations on those Accidents commonly ascribed to the Wind of a Ball*, in *London Medical and Physical Journal*, 1812, Vol. XXVIII, p. 142) states that "there are many substances, comparatively light of themselves, on board ship, such as canvas, rope-yarns, part of the bedding, etc., which, when carried along with the velocity of a ball, or even driven but a short way with that force, are apt to do considerable injury by hitting the body, and, by occupying a large or small bulk, may or may not produce external marks of injury."

[4] ELLIS (D.) (*Observations on the Nature and Cause of certain Accidents which sometimes occur in battle and have been usually ascribed to the wind of a Ball*, in *Edinburgh Medical and Surgical Journal*, 1812, Vol. VIII, p. 1) says that it is sufficiently proven that the peculiar facts ascribed to the wind of a ball "are likewise occasioned by the varied operation of atmospheric electricity, for, in both cases persons are suddenly struck down with loss of sense and motion, vision is impaired or irreparably injured, the body is discolored, the nerves paralyzed, the bones broken, and even life destroyed without any visible external injury or breach of parts, or any appearance of the body from whence the injury proceeded."

from the "windage of balls," have all been disproved, and it is now conceded by modern surgeons that without the actual contact of the projectile injuries cannot occur; on the other hand it is admitted that slight contact from the "grazing" or "brushing" of a projectile, or the rolling motion of a cannon ball over the surface of the body, may, by the weight and momentum, aided by the elasticity of the skin, effect most serious results, while little or no external evidence of such contact is left.[1] Instances of injuries attributable to the explosion of shells near at hand, without wound or contusion, are numerous, and generally well authenticated. They are,[2] for the most part, cases of partial or complete paralysis, deafness, blindness, loss of voice, rupture of superficial blood-vessels, and mental prostration.[3]

CASE 1047.—Private William C. Goodell, Co. A, 6th Vermont, aged 37 years, was admitted into Satterlee Hospital, Philadelphia, August 12, 1862, suffering from shock resulting from the explosion of a shell at White Oak Swamp, Virginia, June 30, 1862. The missile exploded a few feet behind the patient, the fragments tearing off his knapsack and the clothing from the upper part of his body, but producing no visible wound. The shock was very severe, producing a sensation of "sinking into the earth," followed immediately by total loss of power and consciousness, which, however, lasted but for a short time. Upon their return he found himself unable either to hear or speak. Immediately after the reception of the injury he was sent to Harrison's Landing, and thence to Satterlee Hospital, where he came under the care of Acting Assistant Surgeon Francis West, who reports: "On examination no external lesion of the head or spine was discoverable, and he had no paralysis anywhere of ordinary motion or sensation. He could move his tongue perfectly in every way, but *he could not speak*, and he was totally insensible to all sound; he was, in a word, simply *deaf and dumb*. He complained of some uneasiness in his head, which was hot and his face flushed. His pulse was active but not very full. Respiration very little if at all disturbed; no vomiting, bowels regular. The case was regarded as one of probable congestion of the brain at or about the point from which the proper nerves of speech and hearing arise, or, if more general in its character, manifesting itself by particular pressure at the deep origin of these nerves; in other words, that the part of the fourth ventricle giving rise to the glosso-pharyngeal and auditory nerves was compressed, and thus the functions of speech and hearing destroyed. The treatment employed was depletory and revulsive. Blood was taken by cups applied to the nucha and behind the ears, and active purgation was kept up by calomel and other cathartics. Cold applications were made to the head with derivatives to the feet, and a low diet was enjoined. This plan of treatment was pursued for several days, and until all evidence of local or general excitement had disappeared. The only manifestation of disease which then remained was the deaf-dumbness, which did not in any degree diminish. A blister was now applied to the nucha and a discharge kept up for several days. No change was observable in the deaf-dumbness, but the patient was otherwise doing well. Still viewing his disease as dependent upon local hyperæmia, or perhaps non-inflammation of the brain at the point already indicated, which after some weeks of primary treatment had refused to yield, it was determined to try the alterative effect of small doses of calomel. This was given in quantities of an eighth of a grain every three or four hours and continued for several days. No better success was the result. After a short time the calomel was repeated and pushed to a slight ptyalism, but still without any favorable effect. The strength of the patient in a short time began to decline, but without any change in his intelligence or spirits, which all along had been remarkably good. Communication with him was kept up by means of a slate. Quinine in moderate quantities was given, and his general health seemed to improve, but still the deaf-dumbness remained. On mentioning his case to some of my colleagues it was suggested that, as the patient might possibly be feigning an inability to hear or speak, it would be well to render him unconscious by etherization and then test his powers in these respects. The operation only confirmed the reality of the symptoms. Electricity was also tried, but without any good effect. On December 10th, just four months after admission, it was noticed that the left leg had not full power of motion, and that the face was somewhat drawn to the right side. On the 12th of the same month he was seized with a convulsion which lasted for

[1] In *Note* 2, on page 28 of the *Second Surgical Volume*, a supposed case of the "capability of compressed air or wind from a missile to bruise or inflict visible injury" is referred to. The case is reported by Surgeon B. Rhett in the *Am. Jour. Med. Sci.*, N. S., 1873, Vol. LXV, p. 92: "After a skirmish upon John's Island, in which the besieging gunboats took part, a private entered the Marine Hospital of Charleston, of which I was then surgeon, to be treated for discoloration of the skin, a purple, yellow, and green bruise, extending from the mamma to ilium of right side and from the umbilicus to the dorsum. The discoloration precisely resembled such as I have seen in scorbutic patients among the Andersonville prisoners, an ecchymosis. But the man was in perfect health, no signs of scurvy. I give his account of the cause of the injury: He was standing with his rifle held by the barrel at arm's length and the butt resting on the ground, when a large shot or shell passed between himself and his rifle without touching either or moving him from his position. Immediately after he observed the discoloration, and was sent to the hospital for fear of internal injury. The case rests upon my evidence of the injury and upon the soldier's account of the cause."

[2] *Three Cases of Injuries of the Nervous Centres from Explosion of Shells, without Wound or Contusion*, are given by G. BURR, in *New York Med. Jour.*, 1865, Vol. I, p. 428, and *Five Cases of Injury to the Nervous System by the Explosion of Shell*, by B. RHETT, in *Am. Jour. Med. Sci.*, 1873, Vol. LXV, p. 90. Dr. Rhett's fifth case, with his comments thereon, are as follows: "CASE V. The private injured in the gun chamber with Lieut. Poor was brought into the hospital a frightful object, bleeding at mouth, nose, and ears, his eyes protruding from their sockets. The sutures of the cranium parted, one parietal bone overlapping the other, and the sutures with the occipital and frontal bones loosened. The head dislocated from the neck, the latitude of motion showing either a parting of the ligaments or that the base of the occiput was broken up. The thoracic and cervical regions were bloated, blown up with an escape of air into the cellular tissue; emphysema; yet there was no external wound or injury. The place and time did not admit of a *post-mortem* examination. Now the question arises whence this extensive disorganization? I offer the following suggestion, not professing to affirm its correctness: I think the man was driven by the force of the explosion head foremost into the earthwall of the gun chamber; that the cervical vertebræ were driven through the fractured occiput, and the sutures were forced asunder from within by pressure upon the cranial contents."

[3] One hundred and thirty cases appear upon the field casualty lists of compression of the brain stated to have been caused by the explosion of shells. Twenty-three were discharged. Of this number deafness is alleged in one case, irritability in one, meningitis in one, paralysis of limbs in one, paralysis of optic nerve in one, insanity in two, and spinal affection and nervous prostration in one case each. Seventy-one patients returned to duty. Among these cases the early symptoms were temporary deafness in five cases, momentary loss of sight and hearing in one, loss of speech in one, and cephalalgia in one. One patient deserted, and in thirty-five cases the results could not be ascertained.

nearly half an hour, and was followed by stupor, accompanied at short intervals by startlings of an indistinct gutteral sound. On the next day these symptoms had entirely disappeared and his intelligence was found to be perfectly rational, as it had always been during the whole course of his disease, although he retained no recollection of what had occurred during the previous twenty-four hours. He could only protrude his tongue with great difficulty, and it was drawn, in a marked degree, to the right side. The occurrence of this latter train of symptoms was sufficient to satisfy me of the correctness of my early views of the pathology of his affection. The indications were clear that the original hyperæmia and inflammatory conditions had resulted in softening of the cerebral tissue at about the origins of the proper nerves of audition and speech in the floor of the fourth ventricle. From the period of the subsidence of the graver symptoms just enumerated his condition has been variant from day to day. Sometimes he seems to be better, and then suddenly his symptoms become aggravated, with complaint of severe pain in his head. During the last month he has recovered sufficiently to be able to occupy himself in some trifling mechanical work, but still he remains *perfectly deaf and dumb*. The only other manifestation of paralysis is a slight loss of power, with stiffness in his right leg. His intelligence, spirits, and general health are quite good." Goodell was discharged for disability, February 4, 1863, and pensioned. Examiner O. G. Dyer, of Brandon, Vermont, reported, January 31, 1876: "The pensioner has complete loss of speech and hearing, the result of an injury sustained upon the upper middle third of the spinal column. At this point there is an angular curvature of the spine, and to the right, on a line with the spine of the scapula, between it and the vertebral column, a large circumscribed tumefied swelling, tender and painful on pressure, but without heat or redness. The tenderness and pain also extends to and involves the angle of curvature. Pensioner also has partial loss of sensation of both hands and feet. He has also hectical symptoms and is now totally incapacitated from all labor, requiring the aid of an attendant to supply his daily wants. On September 4, 1877, Dr. Dyer reported that the patient "is quite lame and gets about with difficulty."

The proportion of cases of deafness among officers of the artillery arm, as well as among the cannoniers, has been, since the war, a frequent subject of remark,[1] and on page 385 of the *First Surgical Volume* allusion is made to the frequency of rupture of the membrane of the tympanum from "propinquity to artillery fire."

An illustration of the serious injuries sometimes inflicted by the discharge of heavy artillery on soldiers in the near vicinity is given in the following case:

CASE 1048.—Corporal John S. Terhune, Co. K, 32d Illinois, was admitted into the hospital at Evansville, Indiana, in August, 1862. Assistant Surgeon W. D. Turner, 1st Illinois Artillery, reported: "Case of aneurism of abdominal aorta. Traces his injury to the 1st of March, 1862. While on the gunboat Lexington he was leaning over the side of the boat immediately above an 84-pound gun, when it was discharged. Another man was standing behind him and leaning most of his weight on him. The shock from the discharge caused them both to fall, or threw them back about seven or eight feet. It felt like an electric shock. On the same night he commenced discharging arterial blood from the bowels, which continued about four weeks. He was treated by Dr. Christy, 32d Illinois; took pills of opium. The discharges ceased in the beginning of April, when he first perceived a fluttering above the umbilicus, which has been increasing in extent and severity. It extends at present from four inches above the umbilicus to the bifurcation of the aorta below. He was dizzy part of the night when hurt, but was on picket duty part of the same night at Savannah, Tennessee. Present appearances: Anxious, uneasy; is a tall man, six feet three-fourths inch high; is losing flesh. Has, as he says, a sinking in his stomach. Appetite is very poor. Has orthopnœa, dyspnœa, tinnitis aurium, and throbbing in right side of head and neck and in right hypochondrium. Has considerable tenderness over spine at lower dorsal vertebra and to the right side a space of about the size of the palm of the hand. Bowels at times are costive, at present lax. The last blood he passed was very black. Has sensations of numbness when he lies on his back. Feet do not swell. Sleeps at night but two or three hours. Has bad dreams at night of falling off precipices and into water. In the supine position the abdominal aorta is felt to the left and partly over the spine, and is much increased in size. The pulsations at and immediately below the umbilicus for one-half inch are much stronger than at the apex of the heart. The same extends to about one and one-half inch above in the mesial line. One-half an inch above the umbilicus is the most powerful pulsation. Pulse 80, and very weak, feeble, and compressible. Extremities cold and numb. Circulation very defective; least noise causes violent excitement and palpitation. Has paralysis agitans almost constantly; sometimes cannot hold a pen from trembling in his hand. There is general numbness in right side; in stepping on any elevation always puts the left foot forward, as the right is deficient in power. Treatment: Purgatives, rest, anodynes." This man was discharged October 2, 1862, for "aneurism of the abdominal aorta; by compressing the aorta above, the tumor becomes soft and also is reduced in size." He was pensioned. Examiner J. W. Lee, of Majority Point, Illinois, August 9, 1871, certified to diaphragmatic hernia with considerable tenderness on pressure, with slight rupture of the abdominal artery, causing an enlargement of the capillary blood-vessels of the right leg. He is very much emaciated, presenting the appearance of one whose nervous system was gradually giving way, rendering him unfit for manual labor." Dr. W. H. Edson, of Willow Hill, Jasper County, Illinois, states that Terhune died June 24, 1877, from inflammation of the lungs superinduced by his internal injuries. No autopsy.

EFFECTS OF MISSILES AND PROJECTILES FROM SMALL ARMS.—By reference to TABLE CXXI, p. 696, it will be seen that of the aggregate of shot wounds reported during the war, by far the greater number was due to projectiles from small arms. In considering the effects of large projectiles, size, weight, and velocity constituted the principal factors; in the case of missiles and projectiles from small arms, form, both original and that acquired by

[1] LONGMORE, in his treatise upon *Gunshot Injuries, etc.*, London, 1877, p. 118 *et seq.*, graphically describes the effects produced by a terrific explosion of the French and English magazines of gunpowder and munitions of war during the Crimean campaign in 1855.

accidental causes, assumes importance, as well as the relation of the individual injured to the impinging projectile, the direction of the ball, position, structure, and power of resistance of the parts, and course of missile through the tissues. With reference to the projectile itself, form and velocity are of principal importance; size, weight, and volume modify the character and extent of the wound, while the remaining factors have an especial subjective relation. The great disparity in the number of wounds by round balls as compared with those by conoidal balls, indicated in TABLE CXXI, on page 696, shows that the greater effectiveness of the latter was early recognized by the combatants in the late war.

Aside from the influence which the improvements in modern small arms may have had in increasing the general effectiveness of projectiles, the adaptation of the conoidal missile to the rifled gun has unquestionably wrought a change in the surgical relations of wounds, the opinion being generally expressed by surgeons that wounds caused by the elongated missile are more severe and dangerous than those resulting from the spherical ball.

The cylindro-conoidal projectile attains a great range with effective power; it opposes less frontage to the resistance of the air and its velocity suffers less retardation than that of the spherical ball. Rotation upon its long axis tends to give it a steadier flight and a more direct course. Its pointed apex, aided by its rotation, gives it the mechanical advantages of the wedge and screw, enabling it to pierce more easily the structures of opposing bodies while it suffers a proportionately less diminution of force; adding the factor velocity, we have a missile endowed with tremendous force, maintaining for a long time and over great distances a steady flight, not easily deflected, piercing and rending opposing obstacles, and preserving, even at immense range, a momentum sufficient to render it deadly in its effects.

It is probable that the effects produced by round bullets at very close quarters are equally if not more destructive than those produced by elongated missiles; the initial velocity in the two cases does not vary greatly, and, in short distances, the advantage of form as a destructive element is on the side of the round ball; but as the peculiar power of the rifled bullet mainly lies in its destructive effects at long range, the change of military tactics, based on this fact, has compelled the general use of weapons of greater power and has thus lessened the opportunities for comparison on any extended scale.

The size and weight of small-arm missiles vary within such narrow limits as to make practically but little difference in the effects produced by them, though, in the question of the extraction of a ball from between bones or in joints, dimension may be of importance, as well as in the consideration of the gravity of penetrating wounds of the chest, as pointed out on page 615 of the *First Surgical Volume*.

Missiles from carbines, pistols, and from fowling pieces, when used as weapons of war, produce injuries very analogous to those of the ordinary small arms; but, being of smaller size and impelled with less force, their wounding power is generally less:

CASE 1049.—"Sergeant Stephen M. Harper, Co. D, 4th Ohio Cavalry, aged 25 years, while acting as a picket guard, nine miles from Nashville, February 28, 1862, was wounded by seven different bullets, fired simultaneously from a rebel ambush. The missiles were buckshot of the largest size. One shot passed through the biceps muscle of the right arm, entering the skin three lines outside of the cephalic vein, passing upward and inward, and emerging just anteriorly to the nerves and to the brachial artery. Another entered the right deltoid muscle, passing backward, and emerging at a point over the scapula two-thirds of the distance between the acromion process and the inferior angle of the bone. Another grazed the skin two inches above the insertion of the left *flexor biceps cubiti*. Another entered the flesh over the seventh intercostal space, on a line perpendicular from the left nipple, and, passing backward and outward three inches and three-fourths, emerged through the skin over the ninth intercostal space. Another entered over the ninth rib at a point on a line drawn from the right nipple to the right anterior superior spinous process of the ilium. This ball glanced around the body under the integuments, and was arrested by contact with the right lateral surface of the spinous process of the second lumbar vertebra, from which place it was afterwards removed through an incision made for the purpose. Another entered the right thigh two inches below Poupart's ligament, at the

outer margin of the quadriceps extensor muscle, and emerged over the posterior superior spinous process of the ilium upon the same side. The seventh grazed the skin over the body of the hyoid bone. The quantity of blood lost was inconsiderable. Only water dressings were applied to the wounds. There was very little ecchymosis and swelling. Suppuration was slight. The wounds were all healed by the 1st of April; but an attack of diarrhœa, which supervened while in the hospital, so depressed the general health of the patient that he was unable to resume active service after recovery from his wounds." Surgeon E. Swift, U. S. A., reported the case. The patient died in hospital No. 8, Nashville, on April 6, 1862.

At close range the "buck and ball," used extensively in the late war, was considered very effective, for, besides the effect of the round ball, the buckshot had sufficient force to place a man, temporarily at least, *hors du combat.*

The accidental forms and distortions which leaden projectiles are liable to assume by contact with opposing obstacles both within and without the body form a curious and interesting feature in the study of missiles and their effects. The illustrations given in PLATE LXXVIII, opp., are taken from the collection of missiles in the Army Medical Museum.[1]

If the distortions of bullets were of all imaginable forms, their courses were frequently no less erratic, as shown in the following example:

CASE 1050.—Private John R. Smith, Co. G, 22d Illinois, was wounded at Belmont, November 7, 1861. Surgeon J. H. Brinton, U. S. V., who saw this soldier at the time of being wounded on the field, describes the erratic course of the missile as follows: "A small conical ball entered *behind* the left shoulder and passed underneath the skin across *lower part of left side of neck*, across median line, and then upward immediately beneath the base of jaw of *right* side, emerging just below the angle of the maxilla. The man was shot in front of a fence, and the ball lodged in the fence and was removed and returned by his comrade. It was probably a small rifle projectile, or possibly, although unlikely from the time and circumstances, a revolver projectile. The track was superficial, for days discolored olive and yellow, as if painted by a camel's-hair pencil; there was little extravasation and almost no pain; no injury to either clavicle or maxilla. On the 26th of November, nineteen days after the injury, the patient was discharged from the hospital well. I could not obtain the ball. I watched this case almost from the moment of wounding." Smith was promoted sergeant and lieutenant, and mustered out July 7, 1864, at the expiration of his term of service, and pensioned. Examiner T. S. Hening, of Springfield, reported, July 8, 1864: "Smith received a gunshot missile beneath the jaw on the right side; it crossed the median line to the left side and then down the neck and outward to the acromial extremity of the vertebral portion of the spine of scapula. Considerable injury was done to the tissues of the left shoulder, the motion and power of which, together with those of the elbow joint, are much impaired. The left arm is somewhat wasted and its circulation defective." Examiner J. Bowman, of Flora, Illinois, certified, March 31, 1880: "Physical signs of disability are loss of hearing in left ear, paralysis of left arm and hand, extreme tenderness of left scapula and clavicle—in fact the whole left shoulder is disabled. Applicant states that the whole left shoulder and left arm have no power of feeling except a constant tingling and numbness of the muscles of left shoulder and arm, and that he is not able to perform any kind of manual labor." This pensioner was paid to March 6, 1881, and since reported "dropped from Roll because of death."

[1] Of the 20 missiles in PLATE LXXVIII, 15 are conoidal and 5 round balls. Brief abstracts of the conditions under which the missiles were found will be given; fuller details of the cases will be found in the *Catalogue of the Surgical Section of the U. S. Army Medical Museum*, Washington, 1866: *Spec.* 4557 (*Cat.*, p. 607), a conoidal ball split and flattened by the inferior maxilla; nearly one-third of the body is smoothly and obliquely split off from the apex and turned back, forming a plane surface with ragged edges.—*Spec.* 209 (*Cat.*, p. 614), a conoidal ball with the base split on the tibia into three equal parts, two of which are curled outwardly upon themselves. The second groove is almost obliterated.—*Spec.* 4279 (*Cat.*, p. 614), a conoidal ball split on the tibia from the apex to the second rim, with the two halves turned backward. The bullet lodged astride of the middle third of the tibia, and was discovered by the Nélaton probe after an unavailing search by ordinary means.—*Spec.* 4403 (*Cat.*, p. 612), the greater part of a conoidal ball which entered the meatus auditorius externus of the left ear to the depth of an inch and lodged in the mastoid process, whence it was extracted nearly three months after the injury.—*Spec.* 4483 (*Cat.*, p. 605), a conoidal ball much distorted and curved against a vertebra; the apex is obliquely flattened; a piece of bone is held in the base.—*Spec.* 4411 (*Cat.*, p. 611), a conoidal ball flattened by contact with the femur. The apex is undisturbed in shape; impact evidently occurred when the ball was revolving on its short axis, and probably at a low velocity.—*Spec.* 4400 (*Cat.*, p. 604), a conoidal ball, slightly rounded at the apex, with a deep longitudinal groove its entire length, from contact with a clavicle.—*Spec.* 2645 (*Cat.*, p. 610), a conoidal ball extracted from the sole of the foot, laterally and smoothly flattened somewhat like a fan. The smooth surface has a multitude of shallow parallel grooves.—*Spec.* 693 (*Cat.*, p. 606), a conoidal ball flattened from the apex backward, with body curved over the base to a diameter of nearly an inch and one-fourth; ball entered the front of the knee below the patella and passed upward and inward through the inner condyle of the femur.—*Spec.* 1236 (*Cat.*, p. 609), a conoidal ball removed from the knee joint, apparently split longitudinally and expanded and flattened laterally; the missile probably struck in the act of longitudinal rotation.—*Spec.* 4558 (*Cat.*, p. 606), a conoidal ball detected by NÉLATON'S probe and extracted, 20 months after injury, from the sternum. The missile is flattened upon itself from the apex to the second ring, with jagged borders.—*Spec.* 4151 (*Cat.*, p. 593), an elongated rifle ball, very little disfigured, with an ordinary military coat button inverted, together with the cloth to which it was sewn; the missile had passed through the liver and lodged beneath the diaphragm.—*Spec.* 2241 (*Cat.*, p. 615), a conoidal ball with the apex somewhat driven into the body, and the whole laterally compressed with a flattened fragment projecting from one side. The missile was found lodged against the femur behind the trochanter major.—*Spec.* 3028 (*Cat.*, p. 595), a conoidal ball, beaten into nearly a triangular pyramid with very sharp edges, extracted from the lower third of the thigh. It probably ricochetted from a stone before wounding.—*Spec.* 4423 (*Cat.*, p. 612), a conoidal ball smoothly flattened over a surface of one by one and a half inches by contact with femur, without producing fracture. The flattening is lateral, as if by being rolled out after splitting.—*Spec.* 2813 (*Cat.*, p. 600), a spherical bullet flattened and halfway split, with ragged edges, removed from near the fifth lumbar vertebra.—*Spec.* 4564 (*Cat.*, p. 600), a spherical ball, somewhat flattened and smoothly split near the centre, with the smaller portion bent down at right angles; extracted from above the condyle of the humerus.—*Spec.* 4533 (*Cat.*, p. 591), a flattened round ball, which passed subcutaneously from one thigh to the other.—*Spec.* 4435 (*Cat.*, p. 600), a round ball, grooved in one side to the depth of a quarter of an inch, with a fragment bent outwardly, removed from the superior maxilla. It had penetrated the brain through the opposite temple.—*Spec.* 4565 (*Cat.*, p. 600), a spherical ball, irregularly flattened on one side, in which is embedded a fragment of an iron nail as though from the heel of the shoe; missile was extracted from against the bone near the centre of the plantar surface of the foot.

Entrance and Exit Wounds.—Small projectiles impinging upon the human body and penetrating the skin inflict what is known as the wound of entrance; if preserving sufficient force to perforate, the opening last made is called the wound of exit.

These wounds of entrance and exit, which have for years been the subject of lengthy discussions, are believed to possess certain diagnostic values, as indicating in a general way the form and variety of missile, its velocity, its probable course through the tissues, and, to some extent, the nature and character of the wound. Under the force of ever varying conditions they are very diverse in appearance and extent, and their significance is largely dependant upon the experience and acuteness of the observer.

In general, a bullet preserving its integrity, impinging at ordinary range and at a right angle upon a portion of the body well covered with soft tissues and not unnaturally put upon the stretch, leaves, as it passes through the skin, an opening more or less regularly rounded in form, often perhaps a little less in diameter than the missile, with the edges inverted and livid in hue, due to the contusion and to the discoloration from the burned powder carried upon the missile. In the case of a spherical ball there is generally some loss of substance, a portion of the integument being carried away before its obtuse surface. A cylindro-conoidal bullet will probably cause a more irregularly outlined opening, either stellate or slit-like, with serrated edges.

The wound of exit may closely resemble that of entrance, but is usually larger and more irregular, with everted edges, bearing fewer evidences of contusion, but often showing a greater loss of substance.

From this simple uncomplicated form of wound we find an almost infinite variation, dependent upon the peculiar circumstances which impress their characteristics upon each case.

If the missile has carried before it a foreign body, or has become distorted before impact, or has suffered a diminution of velocity and force, the wound of entrance will be modified accordingly. The resistance offered by the tissues to the passage of a missile through any part of the body and the reciprocal effect of the tissues upon the missile will largely influence the character of both entrance and exit wounds. Obliquity of the course of a projectile to the plane of the surface of the body will result in merely a superficial grazing of the skin or penetration and perforation, in which case the appearance of the wounds of entrance and exit will depend on the angle of impact. Fragments of shell produce irregularly shaped wounds, with contusion and considerable loss of substance; should their force be sufficient to perforate a part, the wound of exit is lacerated and ragged, with portions of muscular and connective tissue thrust out of the opening. The differential diagnosis between these and bullet wounds is usually not difficult.

A single wound of entrance may have two or more wounds of exit; as, for example, when a missile is divided upon a bone. A projectile may be split into fragments before striking the body, in which case the fragments may each enter and leave separately, or one or more fragments may lodge. Multiple wounds of entrance and exit are common, resulting from a missile perforating two or more parts of the body successively, as two arms, two legs, the body and one or more extremities, or parts of the same extremity when flexed. Cases are recorded in which the projectile has entered and made its exit by the same opening.

Plate XXXIX, opposite p. 712, and PLATE XL, opposite p. 714, give typical representations of wounds of entrance and of exit made by spherical and conoidal balls and small fragments of shells under varying circumstances. The drawings were made from

recent wounds, at field hospitals, during the war, by the late Hospital Steward E. Stauch, U. S. A., and present faithful delineations of the early appearances of these wounds.[1]

EFFECTS OF PROJECTILES ON MUSCULAR TISSUE AND TENDONS.—The differences of structure and density of the muscular tissues of the body encountered by a missile in its passage are found to influence the directness of its course, unless its velocity, *i. e.*, force, is sufficiently great to overcome the resistance offered, as in the case of conoidal missiles at high velocities, the course of which is generally direct.

Round balls presenting an obtuse frontage part more easily with their force, and are readily deflected by fasciæ and aponeurotic expansion, pursuing curious and devious courses until they either find exit or make lodgement:

CASE 1051.—Corporal S. S. Walker, Co. F, 51st Illinois, aged 26 years, was wounded at Chickamauga, September 19, 1863. He was treated in hospitals in Nashville and Louisville, and on December 2d was admitted into the hospital at Quincy, Illinois. Acting Assistant Surgeon F. K. Bailey reported: "A round leaden bullet entered one inch to the right of the third dorsal vertebra and gives no indication of having passed out, but seems to have passed round the body and lodged in the pectoralis muscle; wound healed." He was returned to duty March 9, 1864, and discharged from service June 16, 1865, and pensioned. Pension Examiner T. S. Hening, of Springfield, Illinois, reported, August 22, 1865: "Applicant received a ball on the right side of the second dorsal vertebra, which entered the back, lodged, and is concealed in the tissues, probably on the inner side of the front portion of the right third rib, where there is tenderness, though the ball did not, I think, pass through the lung; complains of pain in chest and difficult breathing on exertion and in damp weather; also weakness of the right arm and muscles between the shoulders. Has also a buckshot lodged over the right parotid gland, and one on the outside of the left shoulder which only produces slight soreness." The pension examining board at Springfield report, under date of February 18, 1880: "Ball remains unextracted." His pension was paid June 4, 1881.

The effects of missiles of different character upon muscular structures are not dissimilar; the track of a small conoidal ball passing swiftly through a muscle is generally more cleanly cut than that made by a large or round ball; but in all shot wounds there is usually found an irregular channel with contused and lacerated walls, more or less devitalized by contact with the missile, the area of injury gradually shading off by concentric layers until lost in healthy tissue; there is always more or less loss of substance dependent somewhat upon muscular tension or relaxation, also upon the direction of the missile through the muscle, whether transversely or obliquely to its long axis. Fasciæ and aponeurotic tissues are torn and lacerated or simply perforated, according to their condition of tension at the time; their openings seldom correspond with the openings in muscular tissue, owing to the ever constant change in the relations of parts due to movement and muscular action. Hence it is frequently difficult to follow the course of the missile with accuracy; when, for the pur-

[1] The drawings in PLATE XXXIX represent: FIGS. 1 and 3, the entrance and exit wounds of the left foot and the right thigh in the same subject by a conoidal bullet. The soldier at the time of the injury was in a sitting posture on the ground, with the left leg well flexed. The left drawing of FIG. 3 shows the wound of entrance just behind the joint of the great toe; the right drawing the wound of exit diagonally below; the upper sketch of FIG. 1 shows the entrance wound of the right thigh, in which the ball lodged; the missile after inflicting the wound of the foot had probably lost part of its force and had possibly suffered some change in rotation, not striking the thigh directly with its apex. The lower drawing of FIG. 1 shows the entrance wound inflicted by a conoidal ball that flattened on the right clavicle and lodged beneath the scapula. FIG. 2 represents the wounds of entrance and exit in a shot fracture of the ankle joint by a conoidal ball; entrance wound to the left, exit to the right. FIG. 4, a penetrating wound of the abdomen by a conoidal ball; the upper drawing shows the wound of entrance, the lower the wound of exit. FIG. 5, simple flesh wound of thigh by spherical ball; upper drawing represents the wound of entrance, lower, that of exit. FIG. 6, a simple flesh wound of lower third of arm by a conoidal ball; wound of entrance to the left, exit to the right. FIG. 7, flesh wound of arm by a small fragment of shell; wound of entrance to the left, exit to the right. FIG. 8, shot wound of neck by a conoidal ball; wound of entrance to the left, exit to the right, by a missile travelling with high velocity. FIG. 9, shot wound of thigh by a minié ball, large calibre; entrance wound to the left, exit to the right. FIG. 10, flesh wound of hand by fragment of shell. FIG. 11, flesh wound of shoulder by a fragment of shell. FIG. 12, slight flesh wound of leg by fragment of shell. FIG. 13, gunshot wound through body from right to left, between ninth and tenth ribs, by a conoidal ball; the figure represents the wound of entrance. FIG. 14, shot wound of left thigh, fracturing trochanter, from a spherical musket ball. The wounds on PLATE XL represent: FIG. 1, shot wound of left hand, fracturing bone, by a conoidal ball; wound of entrance to left, of exit to right—both very characteristic. FIG. 2, shot wound of foot, fracturing bone, by a conoidal ball; wound of entrance to left, of exit to right. FIG. 3, flesh wound of right arm, making exit from forearm, by conoidal ball; left drawing represents wound of entrance, right, wound of exit—somewhat oblique. FIG. 4, flesh wound of shoulder by a conoidal ball; upper figure shows wound of entrance, lower of exit. FIG. 5, shot wound of leg, involving bone, by conoidal ball; here the right figure represents the wound of entrance and the left the exit wound. FIG. 6, shot wound of foot by conoidal ball; left figure wound of entrance, right, of exit. FIG. 7, shot wound of left shoulder, fatal, by conoidal ball; entrance to left, exit to right. FIG. 8, shot fracture of ilium by conoidal ball; entrance wound to left, exit to right. FIG. 9, flesh wound of leg by conoidal ball; entrance wound above, exit below. FIG. 10, shot wound of arm, involving bones, by a conoidal ball; entrance to left, exit to right. FIG. 11, shot wound of left leg, fatal, by a conoidal ball; entrance to left, exit to right. FIG. 12, shot flesh wound of foot by conoidal ball; entrance wound to left, exit to right—a typical representation of the effects of a conoidal ball at high velocity.

PLATE XXXIX EARLY APPEARANCES OF ENTRANCE AND EXIT SHOT WOUNDS

UNIVERSITY
CALIFORNIA

pose of diagnosis, it becomes necessary to do so, the relation of the individual to the impinging projectile becomes of great importance.

Contusions of muscular tissue are found as the result of the impact of "spent balls," or where the force of the missile has been retarded upon some obstacle, as on a part of the equipment, or on objects upon the person, as books, money, buttons, etc. The contusion may present all degrees of severity from simple ecchymosis to the loss of vitality of the part struck; this may be limited to the skin, in which case an eschar of rounded form and of about the size of the missile is thrown off, or it may affect deeper structures, as the contents of the great cavities.[1] Contusions result more frequently from round than from conoidal balls.

Wounds by distorted bullets, by fragments of shell, by foreign bodies, or by elongated bullets revolving on their lesser axis, are more destructive in their nature than the usual wounds from intact balls; the irregularity of a bullet track, due to the causes mentioned, constitutes one great source of danger in flesh wounds. The cavities and irregular pouches formed along the track give lodgement to foreign matters driven in with the missile, as shreds of clothing, etc., causing irritation, inflammation, and abscess, with the retention and burrowing of purulent accumulations, and exposing the patient to the danger of septicæmia, or, at least, prolonging convalescence and retarding cicatrization.

Many cases attended with extensive destruction of skin, muscular tissue, tendons, and ligaments resulted fatally or in very serious disability from contraction and rigidity of parts, and from the formation of extensive cicatrices impairing motion and becoming the seat of pain and inconvenience.

Gangrene, tetanus, and pyæmia were not infrequent complications, and in a number of lesions of the muscular structure of the extremities life was only preserved by recourse to amputation. Instances of this nature have been cited among the flesh wounds of the extremities.

A few instances of repair of shot wounds of muscles by first intention have been noticed, but they were very rare and presuppose a cleanly cut wound, a sound constitution, and a temperate habit of life.

EFFECT OF MISSILES AND PROJECTILES ON BONY STRUCTURE.—The effects of missiles and projectiles upon the bony structure of the human body have been so thoroughly illustrated in their practical relations that little more than a brief general consideration of the subject is here necessary.

Gunshot injuries of bones may be classified as contusions, simple fractures, partial fractures, penetrations, perforations, and complete fractures, with varying degrees of comminution and destruction of substance. Nearly every form of gunshot missile and projectile used in warfare is liable to cause these various injuries. The properties inherent to the missile, as velocity, size, form, and weight, and the conditions pertaining to the individual at the time, as posture, part wounded, etc., will determine the nature, extent, and severity of the injury. Slight forms of injury *may* result from the impact of a solid shot, a fragment of shell, or from a leaden bullet; injuries of the gravest character may equally be inflicted by these missiles. Between the extremes are found wounds of all degrees and grades, but they are all simply the manifestation of mechanical force acting in accordance with established laws.

[1] A soldier found an iron breast-plate, probably thrown aside by some Confederate, on the field at Kingston, N. C., and put it on. He was struck by a minié ball on the breast-plate over the region of the third rib and severely contused. He expectorated a full pint of blood and suffered from dyspnœa; the next day he was able to walk about. Since the reception of the wound a round excavation about the size of a Belgian minié bullet has sloughed out at the point where he was hit, laying bare the rib. The same breast-plate was worn by another soldier at Whitehall, with less fortunate result. A minié ball struck it near its lower border and passed through it, carrying fragments of it into his abdomen, causing death.

Discussion upon the comparative effects of round and conoidal missiles has been virtually put at rest by the general adoption of arms of precision and some form of elongated conoidal bullet. Writers on modern military surgery agree in conceding to the conoidal missile greater force and more destructive power.[1]

There is no doubt that at very close range the damage inflicted by the round ball is hardly less than that resulting from the conoidal bullet, but beyond this point, and to extreme ranges, the conoidal missile is by far the more efficient engine of destruction:

CASE 1052.—Private G. R. Packard, Co. F, 3d Maine, aged 21 years, was wounded at Fair Oaks, May 31, 1862. Acting Assistant Surgeon S. Teats contributed the following history: "The patient, a farmer by occupation, of temperate habits, having no strumous or other hereditary disease, was wounded by a round ball and buckshot, both coming from the same musket at close range, the ball fracturing the left humerus and the buckshot wounding the left shoulder. The arm was amputated about the middle, a few hours after the injury, on the field. On admission to DeCamp Hospital, June 8, 1862, the whole stump was swollen and painful; the end was nearly cicatrized. Anteriorly, just below the left clavicle and at its external third, there was a small opening from which thin bloody pus was discharging; posteriorly, on the same side, at about the lower angle of the scapula, there was a circular cicatrix the size of a buckshot. About the cicatrix there was a fluctuating tumor, with heat and pain of the part. No aneurismal thrill or bruit. He was much debilitated and anæmic. On passing an exploring needle into this tumor no pus could be detected. July 1st, arterial hæmorrhage to the amount of one pint from the anterior wound, which ceased spontaneously, after which pus was again discharged. July 20th, hæmorrhage again about the same amount as before, again followed by discharge of pus. July 28th, hæmorrhage again amounting to one and a half pints, but this time it did not cease spontaneously as in the two previous cases. On consultation it was decided to ligate the axillary artery. This was done by enlarging the wound and passing the ligature around it near its origin, without, however, seeing the artery, the pulsation of the vessel being the guide. The hæmorrhage ceased as soon as the ligature was tightened. With each occurrence of hæmorrhage the tumor posteriorly diminished in size somewhat. Some two or three days after the operation an organized clot was discharged from the wound about the size of a hickory nut. Two days after this another clot of like size and appearance was discharged. Subsequent to this laudable pus was discharged until August 5th, when the patient died from another recurrence of hæmorrhage. The ligature could not be found; it was supposed that during sleep he had pulled it away. Autopsy sixteen hours after death: On tracing up the axillary artery it was found that about two inches of it had almost entirely disappeared. Commencing just below the first rib a cavity, containing several ounces of moré or less organized clot, existed around this deficiency of the artery, which cavity extended downward into the axilla and backward under the scapula. No pus was found in the shoulder joint. The head of the humerus was very soft, and on cutting through the softened articular cartilage a pasty substance was found beneath it, taking the place of much of the spongy extremity of the bone. This pasty substance was the broken down spongy structure. Other organs normal. In the specimen it will be seen that about one-third of the border of the cartilage of incrustation is detached from the bone. This is due to manipulation and maceration." The specimens were forwarded by Dr. Teats, together with a wet preparation, in two portions, of parts of the aorta, innominata, left common carotid, subclavian and axillary arteries. (See *Cat. Surg. Sect.*, 1866, p. 459, *Spec.* 4339.)

Contusions of bone more commonly result from the impact of missiles under low velocity, as a spent ball or fragment of shell, or when the force of the missile has been nearly expended in overcoming the resistance of overlying tissues, or when the line of direction has been oblique to the bone, causing a glancing or grazing blow. Round balls, parting rapidly with their force after their initial velocity is diminished, will generally contuse rather than fracture; the same is true of shell fragments, unless their weight is sufficient to cause fracture by crushing. Contusions of bone *may* be followed by no very serious results; such cases undoubtedly occurred during the late war, and recovery followed without bad symptoms. Instances of this nature have been reported on pp. 817 and 920 of the *Second Surgical Volume.*

In many cases the contusion was at first unrecognized, until tardy and faulty cicatrization and discharge of bone proved the existence of caries and necrosis:

CASE 1053.—Private C. C. Mulford, Co. K, 6th New York Artillery, aged 42 years, was wounded in the right thigh, at Spottsylvania, May 19, 1864, and entered Fairfax Seminary Hospital six days afterwards. Assistant Surgeon H. Allen, U. S. A.,

[1] MATTHEW (T. P.) (*Medical and Surgical History of the British Army which served in Turkey and the Crimea in the years* 1854-1856, London, 1858, Vol. II, p. 263) found that "the conical bullets used so extensively in this campaign inflict a much more severe and dangerous wound than the old round ball." ERICHSEN (J. E.) (*The Science and Art of Surgery*, Philadelphia, 1878, Vol. I, p. 236) declares: "On the bones especially, the modern conico-cylindrical bullet produces the most destructive effects; not only comminuting the part struck, but often splitting up the shaft of the bone by its wedge-like action, in fissures many inches long leading into contiguous parts." MACLEOD (G. H. B.) (*Notes on the Surgery of the War in the Crimea*, London, 1858, p. 98) asserts that: "The greater precision in aim, the immensely increased range, the peculiar shape, great force, and unwonted motion imparted by the new rifles to their conical balls, have introduced into the prognosis of gunshot wounds an element of the utmost importance." ASHHURST (J., jr.) (*The Principles and Practice of Surgery*, Philadelphia, 1871, p. 158) finds that: "Bullet wounds have increased greatly in severity since the introduction of rifled muskets and of conoidal balls. The old round musket ball, fired from a smooth-bore, produced a comparatively slight wound."

Stauch del

PLATE XL. EARLY APPEARANCES OF ENTRANCE AND EXIT SHOT WOUNDS

UNIVERSITY
CALIFORNIA

described the injury as follows: "The wound was caused by a musket ball, which entered at the upper part of the middle third of the thigh and lodged. The case was treated as a simple flesh wound; patient doing well. On June 14th the missile was found and extracted. A severe diarrhœa came on June 19th and continued till June 25th, when it was controlled. Four days afterwards diarrhœa again appeared, and brandy and opium were prescribed. During the night of June 30th the patient had a severe chill, followed by fever, dry tongue, and collections of sordes upon the teeth. I saw the patient for the first time on July 1st, when he was in a dying condition, being bathed in a copious clammy sweat, though his mind was quite clear, and he complained of no pain. There was discoloration of the skin. He died on the following day, July 2, 1864. Autopsy: Emaciation extreme; affected thigh very little swollen: wound open, and the integuments for some distance above and below it of a purplish red color; femoral vein entirely healthy; internal organs healthy. The bone was found to have been grazed by the ball. Upon removing the femur its walls immediately opposite the track of the ball were found to be stripped entirely of periosteum, and that covering the bone above and below this region was thickened and stained of a grayish hue from contact with a dark colored offensive pus, which laid both in the wound and around the bone. At the great trochanter an abscess of about the size of a hen's egg was discovered. This was entirely distinct from the collection before mentioned, being separated from it by a track of comparatively healthy tissue. The pus contained therein was more laudable than that found elsewhere. When the bone was sawed open, which was accomplished with some difficulty on account of the increased thickness and density of its walls, its entire interior was found filled with pus, the fluid being of an ochre-yellow, with large oily globules floating upon the surface. No trace of the original structure could be seen anywhere. The spongy tissue at the head of the bone was completely discolored with a uniform grayish yellow stain, while that of the condyles was perfectly healthy. The walls of the bone were of great thickness and the sawn surface presented a white, glistening, eburnated appearance. No vascularity was seen, and the haversian canals were found not to be enlarged." The greater portion of the injured femur, contributed to the Museum by Surgeon D. P. Smith, U. S. V., constitutes specimen 2675 of the *Surgical Section*, showing necrosis at the point of contusion on the inner surface in the middle third, above and below which the bone is greatly roughened by suppuration in nearly its whole extent.

Unhappily a very considerable percentage of cases of contusions of bone proved to be far from innocent, and were followed by a train of most serious complications. In discussing shot contusions of the cranial bones in the *First Surgical Volume*, at page 101, hæmorrhage, gangrene, periostitis, and exfoliation were mentioned as early complications, and among the later results vertigo, chronic irritation of the brain, mental imbecility, and impairment of the special senses. Surgeon John A. Lidell, U. S. V., in an article on shot contusions of bones[1] enumerates ecchymosis of the osseous tissue, ecchymosis of the medullary tissue, osteomyelitis of a simple character, necrotic osteitis, and suppurative osteomyelitis, as consequences of contusion of bone, and says: "Any injury of bone in the nature of a bruise, however trivial it may appear to be at the time of infliction, may be followed by serious consequences, which it is the duty of the surgeon to anticipate and ward off if possible."

Stromeyer[2] describes contusions of bones as follows: "They [bullets] strike the bone without breaking it and flatten themselves against its surface; the bone struck becomes necrotic from the destruction of its periosteum. In crowded hospitals such injuries of the larger long bones cause suppuration of the medullary canal, which extending itself, at last by the passage of pus into the veins, gives a fatal termination. In the autopsy (the bone being sawn in its long axis) the marrow is found filled with pus from the wounded part upward, and the same morbid product in the neighboring large veins; as in the femoral vein after contusion of the femur. The spot struck by the ball is colorless and exsanguine; in its circumference appears the commencement of a line of demarcation. Contusions of this kind, which up to the present time have been little attended to in the long bones, are well known in the bones of the skull, where caused by a blow or fall they have the same dangerous consequences if not properly treated, as suppuration occurs in the diploe and purulent inflammation in the sinus, with its usual results." Dr. Lidell[3] is of the opinion that, owing to their better blood-supply and consequent greater vitality, shot contusions of upper portions of the body give more favorable results than similar lesions of the lower extremities. The results as tabulated on the next page from the records of this Office seem to favor this conclusion.

Structure has undoubtedly a great influence in determining the severity of the effects of contusion. Such lesions in the spongy bones or cancellated portions of long bones, attended with extravasation of blood, are very liable to result in extensive and dangerous necrosis, inasmuch as the blood confined within the unyielding structure interferes by compression with the nutrient blood-vessels, or acting as a foreign body destroys the vitality of the bone by setting up inflammatory action.

CASE 1054.—Private J. Tetlow, Co. F, 23d New Jersey, was wounded at Fredericksburg, December 13, 1862. Surgeon G. Burr, U. S. V., reported his admission to the field hospital of the 1st division, Sixth Corps, with "shot wound of leg." Acting Assistant Surgeon G. F. French reported the following result of the injury: "The patient was admitted to hospital at Alexandria on December 19th. He had been wounded by a ball entering on the outer side of the right popliteal space and not emerging. He was a strong and healthy man, his pulse being 90 and full; appetite fair; knee tender, very little inflamed, and slightly swollen. By December 22d the inflammation about the knee was increasing; pulse 98; appetite flagging. On the next day there was high constitutional fever with great swelling and pain about the knee; patient hectic and had a chill. On December 24th a round ball was found lying loose in the wound and was extracted without incision; under portion of internal condyle felt to be bare. December 29th, knee more inflamed and swelled; constitutional fever about the same; pulse 100 and weak. Pus was detected and let out by a free incision, giving much relief. Egg-nog ordered for the patient. On the following day he was more comfortable but seemed exhausted, and was delirious at times; pulse weak. On December 31st he had a chill with pain in the stomach, and two days afterwards he was delirious; pulse very feeble and slow. His death occurred at 5 P. M. on January 2, 1863. Autopsy: External condyle bared of periosteum; joint full of pus; external portion of articular surface of tibia bared also; lower third of femur dissected up with pus; periosteum gone on the inner side and end of internal condyle; bone beginning to necrose. The missile had impinged upon the under side of the internal condyle, doing no further injury to the bone than killing the periosteum over a space the size of a half dime."[1]

CASE 1055.—Private S. F. Blanchard, Co. D, 17th Michigan, aged 25 years, was wounded in the left knee, at the battle of Antietam, September 17, 1862. He was conveyed to the Big Spring field hospital, near Sharpsburg, where Surgeon T. H. Squire, 89th New York, recorded the following description and result of the injury: "The wound was caused by a musket ball which struck just at the inner side of the triceps extensor of the left knee, passed backward, grazing the side of the inner condyle in its course, and came out between the tendons of the inner hamstring. In an early examination of the joint it would have been possible for a good surgeon to conclude that the cavity of the joint had just escaped; but at this date (October 16th) there are all the bad symptoms of such cases—pus in the joint and up the thigh, hectic, diarrhœa, etc. The case presented but little encouragement for the knife since the time I first saw the patient, though he had scarcely failed any for some days. His death occurred on November 1, 1862." The bones of the wounded knee, contributed by Surgeon Squire, and exhibiting destruction of the joint by ulceration, constitute specimen 3580 of the *Surgical Section* of the Museum.

The following case of simple osteomyelitis affords an illustration of one of the frequent and grave results of bone contusions observed during the late war:

CASE 1056.—Private John Anderson, Co. G, 76th New York, aged 30 years, was wounded at Cold Harbor, June 6, 1864. He was at once conveyed to the depot field hospital of the Fifth Army Corps, and on June 12th was transferred to Stanton Hospital, Washington. Surgeon John A. Lidell, U. S. V., reported: "Was admitted for a gunshot wound of the left thigh in the

[1] An abstract of this case was published by J. B. BELLANGER (*Report of five cases of Gunshot Injury of the Knee Joint*) in *American Journal Medical Sciences*, New Series, 1863, Vol. XLVI, p. 44.

upper third, inflicted by a conical musket ball, which penetrated the front of the limb at the inner side of the femoral vessels, and, passing backward and outward through the limb, lodged beneath the skin. It was extracted by an incision from behind. When he came to the hospital, six days after the injury, it was thought that the wound was only a flesh one. His general condition was fair, or rather below par at that time. Simple dressings to wound were ordered, and nutrients and stimulants were allowed. Subsequently the wound did well, and he appeared in a fair way to recover for a time. July 1st, it was observed that he was failing in strength and emaciating. Stimulants and the supporting treatment were continued with tinct. ferri muriat. Afterwards he sank into a typhoid condition, the skin becoming warmer than natural, but without sweats, the pulse frequent and feeble, the tongue dry and red, with almost entire loss of appetite. He also became somnolent, and toward the last it was difficult to rouse him. He did not have any chills. He died July 18th. The amount of discharge from the wound was at no time great, but the thigh remained swelled and inflamed all the while. On making an autopsy it was found that the bullet had struck the shaft of the femur on its postero-inner side, two or three inches below the trochanter, *grazing and bruising it*. The aperture of exit had healed. There was an abscess about the place of injury of the bone as large as an orange, and pus had also burrowed among the muscles of the thigh. There was a large deposit of new bone about the contused portion of the femur. A longitudinal section was made with a saw. New osseous tissue was also found deposited in the medullary canal. The marrow presented the 'red inflammatory' appearance described by Virchow. There was no thrombosis, nor any lesion whatever of the veins and arteries. The cadaver was considerably emaciated and resembled in its general appearance that produced by typhoid fever. There was no lesion of the intestines or any other of the internal organs. For an account of the autopsy and for much other interesting information concerning this case, the writer[1] is indebted to Assistant Surgeon George A. Mursick, U. S. V."

A case of gangrenous osteomyelitis following shot contusion of the femur has been cited on page 171, *ante*, and a similar case is here detailed:

CASE 1057.—Private G. Cole, Co. A, 91st New York, aged 35 years, was wounded in the right thigh, at Petersburg, March 31, 1865. From a field hospital he passed, on April 3d, to the Fifth Corps Depot Hospital at City Point, and two days later he was transferred to Washington. Assistant Surgeon W. F. Norris, U. S. A., contributed the following history: "The patient was admitted to Douglas Hospital, April 6th, with a wound inflicted by a minié ball, which caused a severe contusion of the femur at the middle third without producing fracture. His constitutional condition at the time of his admission was good and the wound looked healthy. On April 12th a very much flattened bullet was extracted by Acting Assistant Surgeon H. Gibbons. On the 17th, erysipelatous inflammation appeared about the wound, which increased on the following day in spite of the application of poultices and tincture of iodine. On the 20th there was a slight attack of erysipelas of the nose, and the following day the patient had two severe chills, which were repeated on the 22d, 23d, and 24th. On the 25th he again had two chills, and one on the next day. The conjunctivæ now had assumed a yellow tinge, and he had pain in the chest; pulse 132. On the 27th there was another chill, the constitutional condition remaining as before, and on the following day there was one more repetition, and secondary involvement of the knee joint manifested itself. The skin and conjunctivæ were now deeply jaundiced, and the discharge from the wound unhealthy, fetid, and bloody. On the 29th there was hiccough, delirium, and vomiting, and the patient sank rapidly. He died on the following day—April 30, 1865. At the autopsy, both lungs were found to be covered posteriorly with an offensive greenish flaky lymph and to contain a number of small pyæmic abscesses. There was about five ounces of effusion in the thoracic cavities. The other organs were but slightly affected. On removing the femur the periosteum was found to be wanting for five inches in length and one-third of the circumference of the bone, the part so bared showing evidence of absorption of its tissue except at the point struck by the bullet. On sawing open the shaft of the femur longitudinally the lower half was discovered to be in a gangrenous condition, the medulla being greenish, soft, and offensive, and the cancellated structure of the condyles presenting the same appearance. There was about two ounces of thin brownish-yellow fluid in the knee joint, and the femoral vein near the joint as well as the small articular veins were filled with clots, their inner coats in some places being reddened and in others of a greenish hue."

A leaden bullet coming in contact with a bone presenting a smooth flat surface, as one of the faces of the tibia, may flatten itself against it, contusing without fracturing the bone:

CASE 1058.—Private W. B. Donkersley, Co. I, 2d New Jersey, was wounded at Chancellorsville, May 2, 1863. He was admitted, on May 8th, into Douglas Hospital, Washington. Acting Assistant Surgeon Carlos Carvallo reported: "This patient received a flesh wound of the right inguinal region; ball extracted on field; doing well, wound suppurating." At the end of a week Donkersley was transferred to Satterlee Hospital, Philadelphia, whence Acting Assistant Surgeon J. H. Hutchinson reported: "This man received a wound from a conical ball which entered the right groin and flattened itself on the bone without producing fracture. He lay upon the field all night, and was removed Sunday morning and the ball extracted. From the time of the wound on Saturday afternoon until Sunday morning he was entirely insensible, and remembered nothing from the time of receiving the shot until he roused to consciousness in an ambulance on Sunday. After reaching this hospital on May 17th, he did well, and went on duty as clerk in the Commissary Department on June 1, 1863." The patient was transferred to the Veteran Reserve Corps in September, 1863, and discharged from service May 31, 1864. He is not a pensioner.

In the next case a conoidal ball struck the angular surface of the tibia with full force. The missile split to within a few lines of its base without seriously contusing the bone:

CASE 1059.—Private Henry C. Mallory, Co. G, 36th Indiana, aged 20 years, was wounded at Murfreesboro', Tennessee, December 31, 1862. He was admitted, on January 3, 1863, into hospital No. 3, Nashville. Surgeon Alexander Ewing, 13th Michigan, reported: "Was struck by a large conical leaden bullet, at about the distance of two hundred yards, at the battle of Stone River, on the 31st day of December, 1862. He was standing in an open plain in the act of loading his gun. The interest in the case is that the centre of the *apex* of the bullet struck directly on the spine of the right tibia, between the middle and

[1] LIDELL (J. A.), *On Contusion and Contused Wounds of Bone, etc.*, in *Am. Jour. Med. Sci.*, 1865, Vol. L, p. 26.

lower thirds, and split the missile to within a few lines of its base, overlapping the bone, where it was firmly held by the tissues. Remarkable as it may appear, the bone was not injured, and in a very short time the wound healed up. It was evident, as well from the distance as the injury done to the bullet, that it struck with full force." Mallory was discharged from service September 21, 1864, and pensioned. Examiner H. H. Deming, of Pana, Illinois, reported, June 23, 1879: "Ball struck tibia on anterior surface, splintering it so that quite a large piece of bone came out. There is left quite a depression and a very large tender cicatrix. If he walks too much the leg swells up. The pain at times is severe."

Instances in which the missiles split upon the bones of the forearm and on the zygoma are here adduced:

CASE 1060.—Private A. Wilson, Co. L, 1st Minnesota, aged 30 years, was wounded at Antietam, September 17, 1862. He was treated in Carver Hospital, Washington, and on December 12th was admitted into Satterlee Hospital, Philadelphia. Surgeon I. I. Hayes, U. S. V., reported: "The ball, the precise character of which is unknown, struck at the outer side of the lower part of the left arm; part of it passed through the member and came out at the posterior surface. Next day a portion of the ball, about the size of a dime, was cut out from the front part of the arm toward the inner side. On his admission into this hospital his arm seemed nearly well, but a small ulcer, scabbed over, marked the point of entrance of the ball, and a probe passed into this discovered a sinus extending several inches upward, a piece of metal being discovered and clearly felt at its upper extremity. His general condition was perfectly good. January 3d, having administered chloroform, I laid open the sinus before mentioned for about three inches and readily extracted a piece of ball. Its concave surface was closely applied to the outer edge of the lower flat portion of the humerus; the bone beneath was roughened and apparently bare of periosteum. On several subsequent occasions I convinced myself that the bone was dead and looked for a tedious process of exfoliation; but on January 15, 1863, thinking to pass a probe, I found the wound firmly united, and the healing process has gone on most favorably. There is no swelling, no tenderness, no orifice through which the smallest probe could be inserted, and the wound has the aspect of a healthy and rapidly healing ulcer." Wilson was returned to duty April 22, 1863, and discharged from service November 24, 1865, and pensioned. The Williamsport Examining Board reported, July 6, 1881: "The projectile penetrated the left arm at the insertion of the triceps and passed inward and upward. Fragments were extracted from two places in the belly of the biceps. Some fragments of bone were removed. The arm has every motion free except tensile strength." His pension was paid December 4, 1881.

CASE 1061.—Corporal Julius Relham, Co. K, 1st Kansas, aged 21 years, was wounded at Wilson's Creek, August 10, 1861, and entered the "House of Refuge" Hospital, St. Louis, on August 16th. Assistant Surgeon S. M. Horton, U. S. A., reported: "The following is an interesting case of a minié ball splitting in two by the resistance offered by the zygoma of the left side of the face. One-half of the ball was found embedded in the corresponding cheek beneath the middle portion of the masseter muscle; the other half was found and extracted from beneath the outer portion of the platysma myoides of the same side. The zygoma was not broken. The case was that of Corporal Julius Relham, of Co. K, of the 1st Kansas regiment, who was wounded at the battle of Wilson's Creek, August 10, 1861. He left the hospital for his regiment, well, November 15, 1861. The inertia of a spongy zygoma splitting a minié ball of lead is similar to that of a tallow candle resisting the woody fibres of a pine board when shot through it from a gun." Relham was mustered out May 31, 1864, and pensioned. Examiner W. Jewell, of Philadelphia, reported, December 27, 1864: "Ball passed through his left cheek, lodging near the angle of the lower jaw. The ball was extracted. The wound continues to discharge and is probably connected with the duct of Steno. The jaw is contracted, preventing the opening of the mouth more than half an inch." The Philadelphia Examining Board, January 3, 1872, certified: "Ball entered through middle of superior maxillary bone of right side; a part of it was extracted in the mouth and another part in the neck below the angle of the lower jaw. All the back teeth of upper jaw of right side decayed in consequence. He has occasional discharge from wound through mouth and nose. Motions of jaw limited and painful; can chew on one side only." The same board reported, September, 7, 1877: "Scar of entrance is puckered to a point and adherent. Exit is fast to muscles of neck and drags badly."

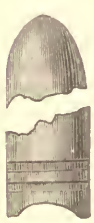

FIG. 388.—Conical ball broken upon the radius. [After BRINTON.]

CASE 1062.—Captain James Ferguson, Co. I, 4th Ohio, was admitted into Seminary Hospital, Georgetown, December 20, 1862, with a shot wound of the left forearm, received at Fredericksburg. Surgeon J. H. Brinton, U. S. V., who examined this officer's injury, reported: "A conical ball entered below the inner condyle of the humerus, traversed the forearm obliquely downward and outward and split on the radius, one portion emerging on either side." Four and one-half inches of the left ulna were removed by A. A. Surgeon H. W. Ducachet. Captain Ferguson was attacked with confluent small-pox and removed to Kalorama Hospital, Washington, February 8, 1863. Acting Assistant Surgeon R. J. Thomas, U. S. A., reported: "The condition of the arm when admitted was bad; no disposition to heal, with strong gangrenous tendency. He died February 15, 1863." Surgeon Brinton furnished a drawing of the divided missile, which is copied in the wood-cut (FIG. 388).

In other cases bullets were found wedged between bones without serious injury.

Simple Fractures, following shot injuries, are infrequent, and generally result from the impact of projectiles of the larger class, as solid shot, grape-shot, or large shell fragments of which the momentum is nearly expended. The examination of the cases of shot injuries of the lower extremities has confirmed the opinion expressed on page 815 of the *Second Surgical Volume*, "that shot fractures of the long bones without injury of the soft parts are more infrequent than visceral ruptures without external wounds."

Hamilton[1] observes: "When the bones of a limb are broken by a solid shot and the

[1] HAMILTON (F. H.), *Treatise on Military Surgery*, Philadelphia, 1865, p. 194.

integuments are not torn the fracture is seldom simple, but almost always the comminution is excessive. Five cases of simple fractures have been reported on pp. 815, 816 of the *Second Surgical Volume*, and three cases are given on p. 440 (CASE 693) and pp. 704, 705 (CASES 1044, 1045) of this volume. To these may be added the following:

CASE 1063.—Private H. Emerson, Co. I, 88th Illinois, aged 34 years, was wounded at the battle of Franklin, November 30, 1864, and was admitted to Cumberland Hospital at Nashville the following day. Surgeon B. Cloak, U. S. V., recorded that "the patient stated that he was struck by a spent cannon ball. There was no external indication of the injury except a small bruise on the left knee and a general ecchymosed condition of the surrounding part. The skin was not broken, but the limb was very much swollen, with pulsation in the popliteal region. The patient's general health was good. The limb was amputated on December 1st, at the lower third of the thigh, by the circular method, by Acting Assistant Surgeon J. C. Thorpe, when it was found that the popliteal artery had been ruptured at its lower portion and that the condyles of the femur, tibia, and fibula were fractured. The patient seemed to do well for twenty-four hours after the operation, when the wound became unhealthy and gangrenous irritative fever set in; pulse 130, skin dry and jaundiced. He continued to sink, and died on December 13, 1864."

Partial Fractures.—Several instances of partial fracture of bone in which a portion of its substance had been cut without complete solution of the continuity were met with. This lesion is more commonly seen in spongy bones or in the parts of long bones well supplied with cancellated structure. In *Specimen* 1998 (FIG. 389) the external portion of the surgical neck of the left humerus is partially fractured, but the continuity of the bone is not destroyed. The patient, Private John G. Levering, Co. A, 5th Michigan, was wounded at Mine Run, November 27, 1863. On account of the extremely unhealthy condition of the soft parts, the head of the humerus was excised December 14th by Surgeon D. P. Smith, U. S. V. Profuse suppuration followed; the patient died of pneumonia January 3, 1864. *Specimen* 1991 (FIG. 390) shows a comparatively clean-cut passage in the outer and upper portion of the internal condyle of the right femur. Private F. Johnson, Co. A, 10th New York, aged 45, wounded at Reams's Station, August 25, 1864. On August 30th symptoms of inflammation of the knee joint presented themselves, and the limb was amputated at the lower third by Surgeon N. R. Moseley, U. S. V.; death from exhaustion and diarrhœa occurred on January 23, 1865. In the following case a conoidal ball had gouged out the anterior surface of the left tibia:

FIG. 389.—Head and 1½ ins. of left humerus. *Spec.* 1998.

FIG. 390.—Lower third of right femur. *Spec.* 1991.

CASE 1064.—Private Joseph Stacey, Co. I, 27th North Carolina, was wounded at Antietam, September 17, 1862, receiving a compound fracture of the left tibia; conoidal ball entered inner side of spine of tibia and emerged one and a half inches below on the outer side. Patient had double pneumonia and pericarditis. Stimulants and supporting treatment: large bedsore. Died of exhaustion November 13, 1862. *Post-mortem:* Left lung almost altogether involved, the lower and middle lobes returning to the first stage; lower lobe of right lung congested. The specimen, consisting of the upper portions of the bones of the left leg, was contributed to the Army Medical Museum, with the notes of the case, by Assistant Surgeon Philip Adolphus, U. S. A. The missile has gouged out the anterior surface of the tibia just below the tubercle. The specimen is numbered 815 of the *Surgical Section*, and is figured in the wood-cut (FIG. 391).

FIG. 391.—Upper portion of left tibia. *Spec.* 815.

Penetrations of Bone.—Small missiles, as bullets and small fragments of shell, often penetrate a bone and remain fixed, with little splintering and fissuring. Instances of this nature are met with in spongy bones or in parts of bones whose structure is cancellated. A unique illustration of such an injury is found in *Specimen* 2590 (FIG. 392). An excavation at the base of the great tuberosity of the humerus, the shape and a little greater than the size of a conoidal ball, one inch deep, extends into the head of the bone. The walls of the cavity are perfectly smooth, as if formed by design, and there is no

FIG. 392.—Head of right humerus with symmetrical bullet groove. *Spec.* 2590.

fissuring or comminution connected with the injury. The case has been detailed on page 543 of the *Second Surgical Volume* (CASE 1513), accompanied by a cut which only imperfectly indicates the nature of the penetration. In FIGURE 392 the nature and depth of the excavation are more clearly illustrated. In the following case the missile lodged in the cancellated structure of the femur, but no fissuring or splintering were observable:

CASE 1035.—Private J. Gleason, Co. B, 2d New Hampshire Heavy Artillery, aged 18 years, was accidentally wounded at Washington, May 10, 1864, by a pistol ball, which entered the upper third of the left thigh anteriorly. He was conveyed to Douglas Hospital, where pyæmia subsequently appeared, the first chill occurring on May 26th, and being preceded by marked icterus. The ball could not be discovered. Secondary hæmorrhage from the femoral artery to the amount of fourteen ounces occurred on May 31st, and to the amount of fifteen ounces on the next day, still further adding to the patient's depression. His death occurred on June 1, 1864. At the autopsy the whole body was found to be deeply tinged with bile. No metastatic abscesses were discovered. The knee joint was found to be disorganized, as was also the hip joint on the wounded side, and a large dark-colored cavity existed in the injured thigh, which had been an immense abscess. No secondary deposits were seen in the lungs. On dividing the femur longitudinally, the medullary canal and cancellated portion of the bone were found in a diseased condition. The medulla was softened, of a dark red color, and in the early stage of that change which is seen in well-marked cases of pyæmia after amputation, when this material is found of a dark green color and in a state of advanced decomposition. Before death the patient had wandering delirium for days, profuse perspiration, chills, a rapid feeble pulse, and icteroid hue. The upper third of the injured thigh, longitudinally bisected, and showing an impacted pistol ball, which penetrated the base of the neck and lodged in the cancellated portion, constitutes specimen 3540 of the *Surgical Section* of the Museum (FIGS. 393, 394), and were contributed, with the history of the case, by Assistant Surgeon W. Thomson, U. S. A.

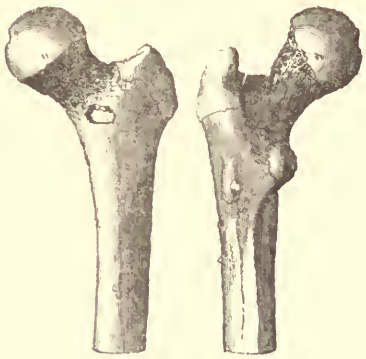

FIG. 393.—Outer view of upper third of left femur. *Spec.* 3540.

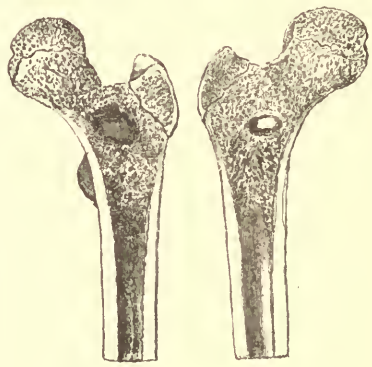

FIG. 394.—View of *Spec.* 3540, after bisection.

FIG. 395.—Lower third of left femur. *Spec.* 406.

FIG. 396.—Lower third of right femur. *Spec.* 405.

More frequently penetrations were accompanied by fissuring and splintering. *Specimen* 406 (FIG. 395) represents the lower third of the left femur with a conoidal ball embedded just above the patella. A fissure extends upward three and a half inches, and another and independent fissure occupies the outer surface. The patient, a Confederate soldier of Morgan's Cavalry, had been wounded in a skirmish in front of Winchester by a minié ball, which perforated the quadriceps femoris close above the left patella and lodged one inch above the articular surface of the knee joint. The limb was amputated by Dr. V. B. Thornton. The patient recovered. *Specimen* 405 (FIG. 396) shows the lower third of the right femur with a conoidal ball embedded, point downward, in the anterior surface, just above the articulation; a fissure extends upward the length of the specimen. Private *Joseph J. Shelley*, 2d Tennessee (Confederate), was wounded at the battle of Middle Creek, Kentucky, January 10, 1862; the limb was amputated by Dr. G. H. Higgins, in the lower third of the thigh. The patient died a few hours after the operation from loss of blood. In those two instances as well as in specimens 4179 and 3228 (FIGS. 397, 398), received without history, the former from the battle-fields of the Wilderness, the latter from in front of Petersburg, the fissures do not extend into the knee joint, although

FIG. 397.—Lower third of left femur. *Spec.* 4179.

FIG. 398.—Lower extremity of left femur. *Spec.* 3228.

the point of impact was close to the articulation. Illustrations of similar injuries in the humerus will be found on page 584 of the *Second Surgical Volume*, FIGURES 461 and 462.

Perforations of Bone.—The illustrations show the manner in which bones may be more or less cleanly pierced. When shafts of long bones are perforated there is commonly much splintering, as illustrated in *Specimen* 7069 (FIG. 399). A Colt's revolver ball passed through the upper third of the femur from behind forward, comminuting the femur; amputation was performed about twelve hours after the injury; death three hours after the operation. In *Specimen* 1662 (FIG. 400), the tibia had been perforated below the head, causing longitudinal fissures: Private Frank B. Robinson, Co. H, 7th New Hampshire, wounded at Fort Wagner, Morris Island, July 11, 1863. The posterior tibial artery was injured. Secondary hæmorrhage ensued, and on August 1st the limb was amputated in the lower third by Surg. R. B. Bontecou by the circular method. The patient died August 11, 1863. In the following case the perforation was in the lower third of the femur, with fissures extending upward:

FIG. 399.—Section of left femur. *Spec.* 7069.

FIG. 400.—Upper portion of left tibia perforated. *Spec.* 1662.

FIG. 401.—Lower third right femur perforated. *Spec.* 76.

CASE 1066.—Private S. S. Kopp, Co. E, 10th Pennsylvania Reserves, aged 21 years, received a shot fracture of the right femur, at Bull Run, August 28, 1862. He was admitted, one week after the injury, to Judiciary Square Hospital at Washington, where the thigh was amputated at the middle third by Surgeon C. Page, U. S. A., on September 20th. The patient survived the operation two days. The amputated portion of the femur, perforated just above the patella by a musket ball, was contributed by the operator, and forms specimen 76 of the *Surgical Section*. It is represented in the wood-cuts (FIGS. 401, 402); two longitudinal fissures extend upward and a slight one enters the joint.

In the next case the shaft of the femur is perforated in its centre. A longitudinal fissure on the anterior surface extends into the joint and for four inches upward, ending in a slight transverse fissure; on the posterior surface an oblique fracture runs upward for nearly four inches.

FIG. 402.—Posterior view of the same specimen.

CASE 1067.—Private Reuben Donnelly, Co. A, 25th Ohio, was wounded at Bull Run, August 30, 1862. Acting Assistant Surgeon Thomas C. Barker reported: "He entered King Street Hospital, Alexandria, on September 3d, suffering with a wound of the right thigh. A round ball entered the front part of the thigh just above the patella and passed directly through the limb from front to rear, dividing the condyles and splitting the bone up the shaft several inches. On September 5th Surgeon J. E. Summers, U. S. A., amputated the thigh at the junction of the lower and middle thirds by the antero-posterior flap operation. The case progressed favorably. Union had taken place throughout the whole of the flaps, with the exception of one point, about one-eighth of an inch in diameter, over the end of the bone, which lay at a depth of three-fourths of an inch below the orifice of the aperture. Patient's health, appetite, and general vigor had been good up to the night of October 3d, when, during a cold rain, he was attacked with a severe chill. The next day, in the afternoon, he had another chill, and although tonics and stimulants were sedulously used with him, he sank in general vigor and his appetite failed. Absorption of the new granulations took place around the aperture which had remained ununited, and the opening increased to nearly an inch in diameter, the integuments retracting and leaving the end of the bone nearly on a level with the external surface. Suppuration occurred in the medullary canal of the bone. Emaciation was extreme; debility was rapidly increasing, with indisposition and incapacity of taking and retaining food, or even stimulants to any appreciable amount; and the patient gradually sank, and died of exhaustion and debility October 20, 1862." The specimen, consisting of the lowest third of the right femur, perforated by a round ball directly through the centre of the shaft, just below the upper margin of the patella, was forwarded to the Museum by Dr. Barker, and is represented in the wood-cuts (FIGS. 403, 404). The shaft is split longitudinally in its anterior surface for four inches, and posteriorly obliquely for the same distance. The condyles are also separated by a fissure.

FIG. 403.—Shot perforation of right femur; anterior view. *Sp.* 319.

FIG. 404.—Posterior view of the same specimen.

In a case of transverse perforation of the tibia just below the head no fissuring was noticeable six months after the injury, when the patient died from exhaustion:

CASE 1068.—Private *J. W. Sailor*, Co. K, 48th North Carolina, aged 23 years, was wounded in the right leg, at Hatcher's Run, March 13, 1865. He was treated in Confederate hospitals until May 6th, when he was admitted into hospital at Point Lookout. Subsequently he was transferred to Armory Square, and lastly to Douglas Hospital, Washington. Assistant Surgeon W. F. Norris, U. S. A., in charge of the latter, made the following report: "The wound was caused by a ball perforating the tibia at the upper third without involving the knee joint. The patient was cachectic and much emaciated, the wound indolent and discharging a thin unhealthy pus. Stimulants, tonics, and good nutritious diet were freely exhibited. On September 3d the wound was carefully examined and a considerable quantity of carious bone was removed. On the next day the patient had a severe chill which recurred on the 6th. He had been subject to periodical chills and fever, and this attack of intermittent yielded readily to a full dose of quinine. On September 10th slight diarrhœa came on and continued for nine days, the patient growing much weaker. The wound, which had improved in appearance after the removal of the dead bone, again looked unhealthy, small abscesses having formed along the line of the tibia, which, when opened and examined by the probe, showed extensive necrosis of the bone. Subsequently the patient had a slight chill, which was followed by an attack of erysipelas of the leg, and from this period he steadily declined. He died, apparently of exhaustion, on October 1, 1865. The autopsy showed a dirty yellowish clay color of the skin. The thoracic and abdominal organs were apparently healthy, except the liver and the spleen, the former being enlarged and the latter much softened and weighing fourteen ounces." The perforated tibia, contributed with the history by Assistant Surgeon Norris, and constituting *Specimen* 1444 of the *Surgical Section* of the Museum, exhibits the deposit of a large quantity of callus on the outside of the bone, and shows the cavity of the passage of the ball to be enlarged by ulceration, the lower portion of the shaft being superficially necrosed. Posterior and lateral views of the specimen are copied in the wood-cuts (FIGS. 405, 406).

FIG. 405.—Posterior view of upper portion right tibia. *Spec.* 1444.

FIG. 406.—The same specimen; lateral view.

Complete Fractures.—In by far the greater number of shot fractures of bones the solution of continuity is complete, the degree of comminution depending upon the attending circumstances. In rare instances fractures, transverse or oblique, but simple as regards comminution, occur. They are commonly due to the impact of partly spent missiles or to glancing or grazing blows. *Specimen* 1148 (FIG. 407) shows an oblique fracture in the upper third of the left femur, with a minute fissure extending to the lesser trochanter and a small portion chipped from the anterior surface at the point of impact. The case has been fully detailed on page 131 of this volume. *Specimen* 1210 (illustrated in the *Second Surgical Volume* on page 475, and a history recorded, in detail, on page 482 of the *First Surgical Volume*) shows the left clavicle transversely fractured directly in the middle without comminution. The missile, which is attached, was a conoidal ball which entered near the third dorsal vertebra, fractured the corresponding rib at its angle, and was found after death encysted immediately beneath the fractured point of the clavicle. Another illustration of this rare fracture is given in FIGURE 408. The *Specimen*, number 1412, shows the lower half of the right humerus apparently amputated for a nearly transverse fracture through both condyles; it was received without history from Surgeon C. S. Wood, 66th New York. In these cases the missile is usually found in close apposition to the fractures.

FIG. 407.—Fracture of the upper third of the left femur by a conoidal musket-ball. *Spec.* 1148.

FIG. 408.—Transverse fracture in lower humerus. *Spec.* 1412.

A form of injury is referred to in *Circular* No. 6,[1] in which the bones are fractured and comminuted, though less than common at the point where the ball impinged, while at a short distance above or below this point an oblique or transverse fracture is produced. When point of impact is above the middle of the bone, the fracture is below; when below

[1] OTIS (G. A.), *Circular* No. 6, War Department, Surgeon General's Office, Washington, November 1, 1865.

the middle, the oblique fracture is found above. *Specimen* 4703 (FIG. 409) shows a nearly transverse fracture in the middle of the left tibia, communicating with the point of impact by a longitudinal fissure. *Specimen* 1064 (FIG. 410) exhibits the lower portion of the left femur, amputated in the middle third for a perforation with oblique fracture above the seat of injury: Lieutenant F. M. Wells, Co. D, 132d Pennsylvania, received, at Chancellorsville, May 2, 1863, a comminuted fracture of the left femur just above the condyles. He was at once removed to the field hospital, and on May 6th was transferred to Washington and admitted into Armory Square Hospital. Shortly after admission he was placed under the influence of chloroform and the injured limb examined. It was decided to amputate the thigh at the middle, which operation was performed by the antero-posterior flap method, by Assistant Surgeon C. C. Byrne, U. S. A. The patient gradually sank, and died June 2, 1863.

FIG. 410.—Lower half of left femur. *Spec.* 1064.

FIG. 409.—Upper half of left tibia.—*Spec.* 4703.

In the following case the transverse fracture is connected with the point of impact by several fissures. Fractures of this nature are principally found in the long bones of the lower extremities, and are probably the result of the direct impact of a missile at high velocity upon the bones somewhat firmly fixed by the weight of the body:

FIG. 411.—Lower half of left femur. *Spec.* 42.

CASE 1069.—Private J. Scanton, Co. A, 3d Maryland, was wounded at Cedar Mountain, August 9, 1862, by a musket ball, which entered above the external condyle of the left femur and passed directly through from front to rear, badly comminuting the shaft to the extent of four inches. He was admitted into the Mansion House Hospital at Alexandria several days afterwards. Infiltration of the soft parts from the anterior superior spinous process of the ilium to the spine of the tibia followed the injury. Amputation of the thigh at the middle third by the circular method was performed by Assistant Surgeon P. Adolphus, U. S. A., on August 15th, and the case resulted fatally on August 20, 1862. The history of the case, with the amputated portion of the femur, was contributed by Surgeon J. E. Summers, U. S. A. The bone is numbered specimen 42 of the *Surgical Section* of the Museum, and exhibits an extensive longitudinal fracture implicating the joint, and being complicated with an oblique fracture in the lowest third (FIG. 411).

Commonly a bone is broken into many fragments, some of which are entirely detached and driven into the surrounding tissues, while others remain connected with one or more of the fragments by shreds of periosteum. Over and above this shattering and comminution, effects common to all forms and varieties of missiles, the extensive splintering and fissuring so often found is unquestionably due to the wedgelike form and great force of the conoidal bullet:

FIG. 412.—Bones of left leg shattered by a conoidal ball. *Spec.* 3273.

FIG. 413.—Same specimen; posterior view.

CASE 1070.—Corporal S. Forrester, Co. E, 67th New York, aged 37 years, was wounded in the left leg, at the battle near Winchester, September 19, 1864. He was admitted into the Sixth Corps hospital several days afterwards, whence Assistant Surgeon J. G. Thompson, 77th New York, described the injury as follows: "A minié ball entered the posterior edge of the outer tuberosity of the tibia, taking a downward direction through the medullary canal, comminuting the bone and becoming impacted beneath its anterior surface, at the junction of the middle and upper thirds. On the morning of September 24th I performed amputation through the lower third of the thigh, being assisted by Acting Assistant Surgeons W. L. Hammond and W. D. Henderson. The operation was done by a modification of the ordinary flap method, making the incision the same as for skin flaps, as described in Smith's *Operative Surgery*, which obviates the redundancy of muscle characteristic of the ordinary flap method, and still gives enough to preserve the even contour of the stump. The patient suffered considerable pain previous to the operation, which was subsequently relieved, and by September 28th he was doing well, the stump healing by first intention. Toward October 8th, however, traces of phlebitis appeared in the stump, thrombosis in the femoral and internal saphenous vein, and the patient was troubled with hiccough and vomiting. Stimulants, tonics, and nutritious diet were administered. Death resulted from pyæmia on October 13, 1864. At the autopsy

the face of the stump was found to be granulating and surrounded with provisional callus; femoral vein filled with thrombus; pus oozing from both the femoral and iliac veins; metastatic abscesses under the integument covering the lower portion of the pectoralis major muscle; fatty degeneration of the liver. In the left ventricle of the heart an embolism was found adherent to the valves." The bones of the amputated leg, contributed to the Museum by the operator and shown in the wood-cuts (FIGS. 412, 413), constitute specimen 3273 of the *Surgical Section*.

When the shaft of a long bone is fractured about equidistant from the epiphyses the fissures extend upward and downward in about equal proportion; but as the point of fracture approaches the ends the tendency is to split in the direction of the longer fragment. This is particularly noticed in fractures of the humerus near the head, where the general tendency of fissuring is downward. *Specimen* 1726 (FIG. 414) is the excised portion of the left humerus, including the head and four inches of the shaft. The fracture is at the surgical neck, and extends with comminution obliquely down the shaft. Excision of the head and four inches of the shaft was performed and the specimen contributed by Assistant Surgeon George M. McGill, U. S. A. *Specimen* 2160 (FIG. 415) shows the upper half of the right femur; the missile struck the anterior surface of the bone a little below the trochanter minor and shattered and fissured the femur downwards. In *Specimen* 2176 (FIG. 416) the comminution extends upward and downward in about equal proportion. The weapon was discharged at close range. The soldier, John Watson, Co. F, 83d Indiana, while on duty at Convalescent Camp, Nashville, became enraged from some cause, threw his musket from him, causing its discharge. The missile, a minié ball, entered the right thigh, greatly lacerating the soft parts and extensively comminuting the femur. He died on the same day. The specimen is a fair illustration of the effects of a conoidal ball at short range.

FIG. 414.—Upper portion of left humerus. *Spec.* 1726.

FIG. 415.—Upper portion of right femur. *Spec.* 2160.

FIG. 416.—Lower two-thirds of right femur. *Spec.* 2176.

From a careful examination of a large number of specimens of long bones in the collection of the Army Medical Museum it would seem that the statement made by Esmarch is correct, that "in comminution of a long bone the fissures almost never extend into the epiphyses; in the same manner injuries of the epiphyses, only in rare cases, extend into the shaft, unless the bullet strikes the adjoining border of both parts, in which case both are usually more or less severely comminuted." This is probably due, in the greater number of cases, as Esmarch says, "to the soldier being generally young and the parts not consolidated." The Museum possesses several specimens showing this kind of injury, some of which have been illustrated on the preceding pages (see FIGURES 409, 410). The few exceptions to this rule seem to be cases in which the consolidation is complete, or in which the direction of the missile was such as to necessarily cause this effect, as in *Specimen* 2564 (FIG. 417), where fissures extend through the head and into the shaft.

FIG. 417.—Upper third of right humerus. *Spec.* 2564.

It has been shown that cases of penetration and perforation of bones may occur without complete fracture; but the contrary is the more general rule, and even in spongy bones,

where we naturally look for such lesions, it will usually be found that complete destruction of the bone has resulted.

EFFECTS OF MISSILES AND PROJECTILES ON NERVES.—Shot wounds and injuries of nerves afforded a wide field for study and observation during the late war.

Wounds of this class, not implicating the great nerve centres and not complicated by severe lesions of other tissues and parts, show a very small percentage of mortality, but comprise a class of injuries which result too often in great and permanent disability, attended with intense suffering and misery, and are often but little amenable to treatment.

In May, 1863, under the direction of the Surgeon General, U. S. A., a hospital for the treatment of diseases and injuries of the nervous system was organized in Philadelphia, under the charge of Acting Assistant Surgeons S. Weir Mitchell, George R. Morehouse, and W. W. Keen, jr., U. S. A.[1]

The results of the experience of these gentlemen in the study and treatment of the large number of cases under their charge have been incorporated by them in several publications which form most valuable contributions to the literature of a much neglected subject, and constitute an admirable digest of the typical forms of nervous lesions resulting from shot injuries.[2]

The immediate effects of shot injuries of nerves were pain—not generally felt locally, but at some point in the distribution of the nerve—in completely divided nerves; total loss of sensation in the parts supplied by it; shock more or less profound, proportionate to the reflex disturbance; and paralysis of motion and sensation, complete or partial. Of forty-eight cases of severe gunshot injuries of nerves selected with a reference to the study of the immediate effects of injuries, Drs. Mitchell, Morehouse, and Keen (*loc. cit.*, p. 14) found that "by far the larger number felt, when shot, as though some one had struck them sharply with a stick," and that "about one-third experienced no pain nor local shock when the ball entered. * * More rarely, the pain of the wound was dagger-like and intense, while a few, one in ten, were convinced for a moment that the injured limb had been shot away; * * in two instances of neck wounds the pain at the moment of wounding was intense, and was referred to the insertion of the deltoid muscle."

In a case of shot wound of the leg the patient felt no pain, but had so vivid an "impression" of a wound in the other leg that he found it difficult at first to get rid of the erroneous idea. With reference to the shock from wounds of nerves the same authorities (*loc. cit.*, p. 15) say: "Every case of wound of nerve trunks in the legs fell instantly, and not one of the whole twelve lost consciousness; yet in gravity and in the size of the nerves injured these were among our worst cases. Of the remaining thirty-one, seven fell instantly, unconscious; one only of these bled very largely. All of the seven were wounded in the neck, face, or arms. Of the total number of arm cases (eighteen in all) two were of the class described above as falling senseless. Of the remainder, two only fell, but with entire con-

[1] The following is a copy of the order organizing this hospital: "SURGEON GENERAL'S OFFICE, *May* 23, 1863. Surgeon W. S. KING, U. S. A., Medical Director, Philadelphia. SIR: The Surgeon General directs that a ward be set apart in either the South or Christian Street Hospital for the exclusive treatment of diseases of the nervous system, and that contracts be made with Doctors S. W. MITCHELL and MOREHOUSE, and that they be assigned to the charge thereof. . . . Very respectfully, your obed't serv't. By order of the Surgeon General. J. R. SMITH, Surgeon U. S. A." Acting Assistant Surgeon W. W. KEEN, jr., U. S. A., was subsequently assigned to duty at this hospital as resident physician, and the scope of the hospital enlarged to include patients suffering from injuries of the nerves.

[2] MITCHELL (S. W.), MOREHOUSE (G. R.), and KEEN (W. W.) (*Gunshot Wounds and other Injuries of Nerves*, Philadelphia, 1864, p. 9) remark upon the number and variety of the cases presented for treatment in the Philadelphia hospital as follows: "Among them were representatives of every conceivable form of nerve injury—from shot and shell, from sabre cuts, contusions, and dislocations. So complete was the field of study that it was not uncommon to find at one time in the wards four or five cases of gunshot injuries of any single large nerve. It thus happened that phenomena, which one day seemed rare and curious, were seen anew in other cases the next day, and grew commonplace as our patients became numerous."

sciousness and in full possession of their senses; fourteen continued standing, or walked away. * * Of the wounds of the lower neck and axilla, brachial plexus, or axillary nerves, one fell senseless, four fell conscious, and the remaining eight suffered no immediate fall. * * If, then, we regard the fall with loss of consciousness as the most marked expression of the condition known as shock, we shall have some right to infer that it is most likely to be severely felt in wounds about the upper third of the body."

In paralysis of nerves, motion is more frequently impaired than sensation. Mitchell, Morehouse, and Keen remark (*loc. cit.*, p. 18): "It would be natural to suppose that a ball striking a nerve, or passing near it, would equally damage its motor and sensory fibres. Practically, it is the motor filaments which suffer most severely, most often, and most extensively. Nor is this less true of the case in all stages, for we find that the lesions of motion are always the least readily relieved and the last to improve."

Of the forty-eight cases studied by these gentlemen (*loc. cit.*, p. 17) with reference to paralysis, five were rejected as being wounds affecting nerves of single function; of the remaining forty-three, "thirty-two exhibited total loss of motion with defective sensation or entire loss of that function. In the remaining eleven there were partial loss of motion and usually slight loss of sensation." In defining total loss of motion "it is to be understood that the whole limb became powerless at once."

Of injuries resulting from shot wounds of the great centres, those of the cranium have been fully considered in the previous parts of the history; it may be stated in general terms that the greater percentage of such injuries proved fatal at once or within a short period. Those who survived the original injury most generally became the victims of insanity, epilepsy, or chorea.[1]

CASE 1071.—Private W. T. White, Co. D, 84th Indiana, aged 20 years, was wounded at Chickamauga, September 19, 1863. Surgeon W. M. Chambers, U. S. V., noted his admission into hospital No. 15, Nashville, with "gunshot wound of upper jaw, with injury of infra-orbital nerve; simple dressings applied." The patient was discharged from service at Madison, Indiana, May 16, 1864, and pensioned. Examiner George W. Mears, of Indianapolis, reported, June 21, 1864: "Ball entered left side of nose one-half inch below the inner corner of the eye, and ranging backward and outward escaped on the posterior and outer or left side of the neck two inches from the ear. The wound is healed except at a point forward of the ear, where an abscess formed. The sight of the left eye is nearly extinct. The under lid is somewhat deformed and the cheek much swollen. There is also a constant discharge of saliva from the left corner of the mouth, which is also slightly deformed." Examiner J. C. Helm, of Muncie, Indiana, reported, November 10, 1868: "The sight of the left eye is much injured, and what there is, is in my opinion worse than useless, as the eyeball is so much turned outward as to destroy the axis of vision and confuse the mind with other objects. The ball passed through the base of the skull, evidently injuring the cerebellum, and as a consequence he suffers from vertigo, dizziness, blindness, faintness, etc., and has frequent spells of severe pain in the head, which are increased by exercise or excitement. These symptoms are growing worse, and he is in great danger of insanity, which I fear will ultimately be his lot. The deformity is also growing worse; the eyeball is turned out and is constantly red, part of the face is paralyzed and twisted over so as to be quite hideous, and is getting worse, as are all these symptoms, so that altogether his disability is equal to or worse than the loss of a limb." Later reports do not show any improvement in the condition of the pensioner. The pensioner was paid December, 1881.

A reference to TABLE CXVII, page 689, *ante*, will indicate the large number of wounds recorded as affecting in some manner the spinal column and its contents. The percentage of mortality will afford some evidence as to the varying extent and gravity of these wounds. Where the spinal cord was severed or involved, a fatal issue seems to have ensued more or less remotely.

Aside from these there were innumerable cases of lesions in which it was evident that there had been damage done to the nervous centres by concussion, compression, or contusion, or in which were presented the phenomena of reflex paralysis.

[1] Instances of epilepsy following injuries of the skull will be found in the *First Surgical Volume*, at pp. 22, 48, 50, 54, 55, 59, 118, 119, 176, 177, 187, 193, 194, 196, 198, 215, 218, 221, 228, 230, 235, 237, 238, 257, 270, 282, 284, 287, 288, 289, 293, 319, and 341, and of impairment of the mental faculties at pp. 12, 30, 53, 117, 118, 119, 120, 164, 166, 171, 172, 173, 174, 175, 176, 181, 185, 193, 194, 217, 221, 226, 228, 231, 232, 234, 236, 237, 238, 244, 253, 294, 310, 340, 350.

The following cases will serve to illustrate these lesions and injuries of the spine:

CASE 1072.—Private C. C. Thomas, Co. A, 2d Wisconsin, aged 23 years, was wounded at Gettysburg, July 1, 1863. He was admitted into the hospital at York, Pennsylvania, on July 17th. Surgeon H. Palmer, U. S. V., reported: "Minié ball entered the back at the point of the right shoulder blade, passed across, and was extracted three inches below the left shoulder blade, deeply situated. Patient complains of numbness and loss of power of the legs. There is no displacement or tenderness of the spinal column. Cold-water dressings; orifice of entrance filled with granulations, that of exit discharging some pus." He was discharged from service January 6, 1864, on account of partial paralysis of the lower extremities, the result of the injury, and pensioned. Examiner L. S. Thompson, of Shackopee, Minnesota, reported, September 23, 1875: "Ball entered just below inferior angle of right scapula, and passing across the back lodged about two inches below the inferior angle of the left scapula, from whence it was removed. The missile injured the spine to such an extent that the patient has but a limited control over the inferior extremities, and from this cause, together with the consequent weakness of the spine, he is incapacitated for all manual labor." Examiner H. H. Kimball, of Minneapolis, reported in September, 1877, that the pensioner "has only partial control over the bladder and rectum."

CASE 1073.—Lieutenant J. F. Moreland, Co. C, 17th Indiana, was wounded at Hoover's Gap, Tennessee, June 23, 1863. Assistant Surgeon S. J. F. Miller, 5th Kentucky, reported, from the Officer's Hospital, Murfreesboro', Tennessee: "The patient entered this hospital June 27th, wounded by a minié ball. It struck him two inches to the left of the spinal column, opposite the first lumbar vertebra, and followed up the spinal column until it reached the spinous process of the first cervical vertebra, when it turned to the left, and was cut out just beneath the skin over the middle third of the sterno-cleido mastoideus muscle; the lower half of his body was paralyzed. He passed his feces unconsciously and we had to draw his urine with a catheter. He died July 12, 1863; for want of time no autopsy was performed."

CASE 1074.—Color Sergeant James S. Schermerhorn, Co. F, 127th Illinois, aged 33 years, was wounded at Vicksburg, May 19, 1863. He was treated in the field and at Webster Hospital, Memphis, and Marine Hospital, Chicago, and discharged from service December 9, 1863, for "gunshot wound of spine with fracture of the spinous and transverse processes of the ninth, tenth, and eleventh dorsal vertebræ. There is partial paralysis, but also severe pain of the whole column, producing severe nervous spasms." Examiner J. P. Lynn, of Chicago, reported, January 23, 1864: "The ball struck the crest of the left ilium three inches back of the anterior superior spinous process, passed through near the sacrum and lumbar vertebral articulation, and was cut out two inches to the right. The wound of entrance is discharging, the other is healed, but an opening over the spine is discharging pieces of vertebra and pus. There is nearly complete paraplegia." On July 24, 1865, Dr. Lynn reported: "Since he received his wound he has been and is now wholly deprived of the use of his legs. His bladder is paralyzed and his urine has to be drawn by a catheter. He has also only partial use of his arms, and is unable to sit upright." Being an applicant for a chair in which to propel himself, he was examined at Chicago by Assistant Surgeon Thomas J. Asch, U. S. A., January 17, 1871, who states: "There is complete paralysis of the lower extremities below the seat of the injury; locomotion is utterly impossible, and the trunk cannot be maintained in an upright position except with the aid of a supporting apparatus consisting of two steel rods with crutch-shaped extremities to support the arms, fastened to a belt buckled around the body. * * * He was confined to his bed from the date of his wound until the Spring of 1870, during which time portions of the vertebræ were removed by Dr. Isham of this city." Examiner L. H. Robbins, of Lincoln, Nebraska, reported, August 5, 1874: "The pensioner is wearing an apparatus to support the upper part of the body, without which he has no power to sit erect. The legs are wholly useless. He requires the regular personal aid and attendance of another person." The pensioner was paid December 4, 1880.

In the next case[1] it is supposed that the spine was wounded or that the missile lodged within the vertebral column in such close proximity to the nerve centres as to cause compression of the anterior branches:

CASE 1075.—"Private S. Johnson, Co. I, 8th Pennsylvania Cavalry, aged 18 years, enlisted in August, 1861. Health good previous to enlistment, except a typhoid fever four years before. Six months after enlisting he had a fever, probably of a malarious character. Three weeks before he was wounded he suffered with pain in the right leg, made worse by movement, but unaccompanied with any rheumatic swelling of the joints. May 3, 1863, he was wounded by a small ball in the left cheek while riding at a trot. It entered at the middle of the ramus of the jaw a little below the level of the teeth. From his position as well as the after evidence, it seems that the ball passed backward and inward and finally lodged in the spinal column. The edge of the jaw was somewhat injured, and probably was the source of the small fragments of bone which afterward escaped from the neck. When shot the man fell forward on his horse's neck; says he was confused though conscious, and felt as if he had been struck in the ear and then lifted up in the air. He also felt instant pain in the back of his neck and in all of his limbs. There were no spasms. He was removed from his horse and carried to a house near by. The motion increased his pain, especially any movement of the neck. He now became aware of the total motor paralysis of the arms and legs. He is not sure whether sensibility was also extinct or not. Two days after being wounded he became delirious, but gradually recovered his senses after three or four days. He was finally sent to Douglas Hospital, Washington, then under charge of Assistant Surgeon W. Thomson, U. S. A., and was transferred to our own wards July 19, 1863. The wound healed in nine weeks, after the discharge of a few small fragments of the jaw. Meanwhile his left leg improved slightly. July 19, 1863; present state: A more wretched spectacle than this man presents can hardly be imagined. He lies in bed motionless, emaciated to the last degree, and with bedsores on both elbows and both hips. His hands lie crossed on his chest, perfectly rigid, the fingers extended, the skin congested and thin, the nails curved, false anchylosis of all the joints of the upper limbs, the head and neck rigid, with acute pain in these parts on movement. The right leg has motion of a feeble nature in all of the joints; the left only very slight voluntary movement. The hands, the appearance of which has been already alluded to, present certain characteristics which belong

[1] MITCHELL, MOREHOUSE, and KEEN, *Gunshot Wounds and Other Injuries of Nerves*, Philadelphia, 1864, p. 22 *et seq*

usually to cases in which there have been wounds of the brachial nerves. In the present instance, as in many others, these peculiarities have been modified by the long continued rest of the limbs in one posture. The results of the nerve injury and its consequent effects on the nutrition of the part may, however, be partially discriminated, so that what is due to them and what is due to mere rest may be discerned to some extent. Thus, the shining palm, the slight eczema, the burning pain, the atrophy, and the swollen joints, whose appearance simulates subacute rheumatism,—these, with the contraction of certain muscles, are all owing to the nerve lesion; while the anchylosis and the peculiar flattening of the hand are perhaps owing to this and to the long rest and disuse, the arms meanwhile lying crossed on the chest, the fingers in extension. The disuse alone would have caused anchylosis, but never to such a degree as occurs when the joints have been subacutely inflamed at the same time. The loss of the lateral palmar arch is owing to both causes, and the monkey-like appearance of the hand, the thumb rotated outward, and its nail looking upward and even toward the forefinger, is caused first by the subluxation of the metacarpo-phalangeal articulation, and secondly by the weakening and atrophy of the adductor and short flexors of the thumb. The nerve lesion, affecting the muscles and the general nutrition of the part, has so relaxed the unused tissues of the limb as to make the pressure of its own weight an effective aid in thus altering its form. Specimen 6693 of the Army Medical Museum represents casts of both arms, and exhibits admirably their condition soon after they began to improve. *Sensation:* Tactile sense enfeebled equally in both arms, worse in the left. Feeble in both legs, worse in the left. Confused power of localizing sensation in the legs. Mistakes right for left, but not left for right. There is muscular hyperæsthesia of the upper members, shoulders, and neck; none in the legs. The left brachial plexus is sensitive to pressure and this causes pain in the left arm and hand. The palms prickle and burn a little, the feet not at all. Every attempt at passive motion causes exquisite pain in the arms, hands, and shoulders; but most of all the back of the neck, about the first and second vertebræ. This is due, first, to the hyperæsthesia of the muscles, and secondly, to the state of false anchylosis, owing to rest in one fixed posture. He either is too weak to move the body or is really paralyzed in the spinal muscles. The biceps flexors and wrist muscles are very rigid as well as the trapezius, and the atrophy of the muscles throughout the upper limbs is singularly well marked. His condition was too grave to allow of an electric examination. There was no inflammatory swelling about the neck, and it was therefore resolved to treat him with free passive motion, breaking the adhesion and forcing him to exert himself as far as he could. Tonics, porter, and liberal diet were ordered, and the shampooing and passive movement was vigorously carried out, despite his pain and most earnest supplications to be let alone. The bedsores were treated with alternate applications of iced water for ten minutes, followed by a poultice as hot as could be borne. This local means, recommended by Brown-Séquard, succeeded marvelously, as it always does, the bedsores healing easily within ten days. August 25th, still losing flesh; great pain in the neck; moves head and legs a little better; no change in the arms. Despite his prayers and protestations the shampooing was continued, and on October 15th he was greatly improved. He is fatter; the legs can be voluntarily crossed; appetite voracious. December 7th, great gain; can move right arm freely; can raise his head, bend and turn the neck; sits up daily. December 29th, motion returning in right hand; no gain in left; but in both the malpositions have been relieved and the hyperæsthesia reduced. From this time the improvement was manifest and rapid. On January 7, 1864, the case was carefully reviewed with the following results: *Nutrition:* Much fatter; atrophy lessened. The hands have lost their smooth, shining look, so expressive to us of a nerve lesion. The nails are less curved. The temperature is better. *Sensation:* Right arm and hand, tactility and localizing sense good; left arm rather less perfect; tactility and localizing sense in legs normal or nearly so. Sense of pain more perfect than at first, but even now a pinch causes a feeling of prickling only, rather than the usual sensation. There has been some burning of the right face, neck, and arm within the past week. *Voluntary motion:* Left leg normal in extent of action, but still feeble; right leg healthy. The right arm has regained all the shoulder and elbow motions except that, owing to a remnant of contraction in the biceps, extension is not quite entire. Flexion, pronation, and supination are perfect. Extension of wrist incomplete, owing to contracted state of flexors. Flexion of wrist perfect. The thumb has lost abduction, owing to contraction of the abductor. Fingers, extension perfect, as also flexion of first phalanges; the joints being still stiff and swollen, the second and third joints possess but two-thirds of their healthy extent of flexion. *Left arm:* For ten days past the shoulder has begun to exhibit voluntary power; elbow, no movement; pronation and supination slight; flexion and extension of wrist also slight; fingers, feeble, tremulous movements. For the first time we now examined the electric state of the muscles. The electro-muscular contractility was good in the right biceps, feeble in the left; good in the right supinator longus, feeble in the left; good in the extensors of both hands; good in the flexors of the right hand, feeble in the left. The interossei on both sides showed great loss of this property. The abductor policis on the left had no electro-muscular contractility. As a rule, this property was lessened in the left arm and shoulder, while the electro-muscular sensibility was scarcely altered in the two members, except, perhaps, some diminution in the thumb muscles of the left hand and in the flexor group of the left forearm. The whole left arm was still very stiff. Ordered the patient to be etherized daily, and the adhesions to be forcibly broken. Passive motion to be continued, and the limbs to be faradized daily. The future progress was inconceivably rapid. On January 20th he could rise to his feet, and by February 20th could walk a few steps. March 20th, walks well without a cane or any aid; the left hand alone has not gained to any great extent, although the malposition of the hand has been much relieved. The patient was discharged in March, slightly shuffling in his walk, but with nearly entire use of all his limbs except the left hand and forearm." Johnson was pensioned. The Philadelphia Board of Pension Examiners reported, October 23, 1873: "Total paralysis of left leg so as to cause foot to trip at times." In November, 1877, the same board reported: "Suffers no pain in arm, but has to move arm in different positions. Is anchylosed at shoulder and partially so at elbow. Toes are drawn up and use impaired; paralyzed. Has evidently progressive nerve trouble from ball, no doubt, lodged near spine in cervical region. Has weakness of hand, right side, and is cold almost all the time. There is atrophy of arm, forearm, and leg, left side."

The following case illustrates what is known as concussion or "commotion" of the spine; it is not supposed that any large nerve could have been touched:

CASE 1076.—Thomas Carroll, aged 21 years, plumber, of New Jersey. Enlisted November, 1863, in Co. D, 3d New Jersey Cavalry. Healthy to date of wound. December 15, 1863: While seated on a fence rail, a pistol ball, accidentally fired, took

effect on the back of his neck. It entered at the middle line, exactly over the interspace between the spinus of the sixth and seventh cervical vertebræ, and was cut out on the left side of the neck one inch below the angle of the jaw. No bone escaped at any time, and the surgeon who explored the wound at the time of the injury felt assured that there was no fracture. The patient thinks that he was looking to the left when hit, but is not sure. If he be correct as to his position, the ball could have come near to no part of importance except the spine, and, in any case, it would be difficult to assert that it could have wounded the cervical and still less the brachial plexus. He fell senseless, was removed to a hospital tent, and finally recovered his reason within two hours. As he became aware of his condition he found that although he could talk, see, and hear, he had neither motion nor feeling in any of his limbs. The trunk was equally powerless. He describes himself as at first unable to feel the bed upon which he lay, but as having good feeling in the head and face. About the second day he had severe pain and tenderness in the right shoulder and neck. Gradually, sensation first, and then voluntary power, returned to the whole right side. Within a month the left side also improved, with the exception of the left arm. Within two months the right side was well and the left leg nearly so. About May 1, 1864, he began to be able to stir the left thumb. Present state, May 14, 1864 (admitted May 12, 1864): General loss of flesh. Left arm exhibits marked atrophy. Measurements: Left biceps, 8¼ inches; right biceps, 9¼ inches. Forearm, left, 8½ inches; right, 9¼ inches. Legs, no notable difference. The left shoulder muscles are fearfully atrophied, especially the deltoid. The arm has dropped, owing to want of support, so that a thumb may be laid in the furrow between the head of the humerus and the acromion process. This subluxation of the bone increases the apparent length of the left arm nearly half an inch. Casts of both shoulders, which exhibit well the deformities, were sent to the Army Medical Museum at Washington. There are no contracted muscles. The hand is swollen and congested, the cuticle thickened and hanging in yellow scales. Nails not curved. No acid sweat. Slight burning of the left palm a recent symptom. Tactile sensation and sense of pain absent in left ulnar distribution, and defective everywhere else in the arm below the shoulder. Normal in right arm. Sensation alike in the legs, and normal in both. The right arm is weak; the left arm powerless, except slight ability to abduct the thumb. The left leg is weaker than the right, and his gait is awkward, from his swinging his right leg outward and forward.

As the subject of reflex paralysis is one of great interest in the study of spinal injuries, and has been thoroughly and exhaustively treated in *Circular* 6, S. G. O., March 10, 1864, it is deemed proper to reproduce the Circular at this point:

"CIRCULAR No. 6.

"SURGEON GENERAL'S OFFICE,
"WASHINGTON, D. C., *March* 10, 1864.

"The following paper on Reflex Paralysis, the result of gunshot wounds, founded chiefly upon cases observed in the U. S. General Hospital, Christian Street, Philadelphia, by S. Weir Mitchell, M. D., George R. Morehouse, M. D., and William W. Keen, jr., M. D., is published for the information of Medical Officers, in the belief that immediate and practical benefit may be derived from it:

"JOS. K. BARNES,
"*Acting Surgeon General.*"

"Since the establishment, in May, 1863, of a Special Hospital for the treatment of diseases and injuries of the nervous system, a vast number of cases of gunshot and other injuries of nerves have been studied by the authors of this paper.

"The great mass of these will be considered in a future essay, upon the history, results, and treatment of gunshot wounds of nerves. We have judged it wise, however, to report separately a class of very infrequent cases, in which paralysis of a remote part or parts has been occasioned by a gunshot wound of some prominent nerve, or of some part of the body which is richly supplied with nerve branches of secondary size and importance.

"So far as we are aware, the Medical Histories which we are about to record stand alone as the first reports of sudden reflex paralysis from mechanical injuries. How they differ from the paralytic affections which result from disease of organs, and which have been so ably treated of by numerous authors, we shall presently consider. That they have thus far escaped notice may be easily accounted for. In the first place they are rare; among some sixty or more carefully studied instances of wounds of nerves, we have met with only seven cases of reflex paralysis of remote organs, in which the influence was prolonged or severe. In the majority of cases the reflex effect is either very slight or very transient, and for one or both of these reasons unlikely to attract notice from surgeons on the battle-field, or in division or Corps hospitals, where their brains and hands are taxed to the utmost by the palpable misery of wounds in the early stages of treatment. Had it been otherwise, we do not doubt that numerous cases of reflex paralysis from injuries to nerves would have been recorded.

"The various effects produced upon the nervous system by gunshot wounds have received, it seems to us, far less attention and far less study than their interest and importance appear to call for. Among them are some which must clearly be classified with the results illustrated by the cases reported in this paper; but there are also others which are far more numerous, in fact very common, and which are signally exemplified on every battle-field. These have been more or less vaguely treated of as shock, commotion, stupor, etc. The larger part of those, who receive flesh wounds involving no important organ, are but little affected at the time, or may even be unconscious of having been hit, and at all events exhibit no well-marked immediate constitutional disturbance. In other cases, and particularly in wounds of graver nature, the patient instantly falls senseless, and so remains during a few minutes, or many hours, reviving again either completely, or suffering from a continued state of depression known as the result of shock, and marked by the usual features of great weakness, feeble circulation, pallor, etc. In other cases these last-named symptoms come on at once, and without the intervention or accompaniment of unconsciousness. These very interesting states of system may be due, it seems to us, either to an arrest or enfeeblement of the heart's action through the mediation of the medulla oblongata and the pneumogastric nerves, or to a general functional paralysis of the nerve centres, both spinal and cerebral, or finally to a combination of both causes. Arrest of the heart movements is producible, as is now well known, by any violent irritant directly addressed to the trunks of the pneumogastric nerves, or to the medulla oblongata, and it is conceivable that such an effect may be brought about by any very severe injury of an external part.

"In fact, it has long been known that the sudden crushing of a limb in inferior animals will stop the heart or make it act slowly for a greater or less length of time. Now if we add to this M. Bernard's experiments, in which he showed that irritation of the posterior roots of spinal nerves suddenly checks the cardiac motions for a time, and that like irritation of the anterior or motor roots gives rise to no such result, we shall be able to see how it is possible that a gunshot wound of a large limb may be competent to effect a like result. We should remember, too, that in nearly all of these cases the hæmorrhage from large vessels, such as are usually opened by accidents of this nature, is sufficient, even during syncope, to add to or deepen, so to speak, the effects of the reflected nerve impression. Where small vessels only have been wounded this might not occur, but it is proper to state that men who have fallen senseless at the instant of the wound, frequently awaken after a time to find themselves drenched with blood. Supposing such an arrest of the heart movements to have taken place, a continuance of their stoppage, even for a brief period, would naturally give rise to cerebral anæmia, pallor, unconsciousness, and the remaining phenomena of shock.

"Again, as we have said, a severe injury, as a gunshot wound of a limb or the neck, may produce its effects of unconsciousness and loss of power by greatly weakening or for a time destroying, with various degrees of completeness, the functions of all the nerve centres and of their conducting cords.

"The influence of shock in thus causing temporary paralysis of nerve trunks is very well known to every experimenting biologist. Thus, after opening the spinal cavity, it is very common to discover that the sensitive nerves are for a time unimpressible by stimuli. But, as a general thing, this is not so as regards the nerve centres within the skull, which are rarely so disturbed by the operation of uncovering them as to refuse all reply to irritations.

"The majority of physicians will no doubt be disposed to attribute the chief share in the phenomena of shock in its various forms to the indirect influence exerted upon and through the heart. There are, however, certain facts, which, duly considered, will, we think, lead us to suppose that in many cases the phenomena in question may be due to a temporary paralysis of the whole range of nerve centres, and that among these phenomena the cardiac feebleness may play a large part, and be itself induced by the state of the regulating nerve centres of the great circulatory organ.

"The loss of consciousness, and the appearance of a state outwardly resembling syncope, prevent us in most cases from feeling sure that the great nerve centres suffer loss of function primarily and not through want of nutrition from feeble or arrested heart action. But there do exist certain cases, more rare, it is true, in which singular affections of the nerve centres, other than those of the heart, occur as a consequence of wounds. These are well described by Legouest in

his *Surgery of the Crimean War*, page 219, and in somewhat varied shapes must have been seen by all who are familiar with the early history of gunshot wounds. The patients to whom we refer do not fall when struck, but become insanely excited or almost hysterical. The author above alluded to supposes that this form of nervous excitement occurs chiefly among those who are already excited by immediate conflict and who are actively engaged.

"One well known instance has been related to one of the authors of this paper as having taken place in the Mexican War, in 1846. An officer of well known courage was wounded in the heel, and was thrown at once into a state of alarm, which caused him to exhibit signs of the utmost trepidation. His character for courage was such that the favorable verdict of a subsequent Court of Inquiry was scarcely needed. No cases, such as the above, or such as Legouest has related, have been met with by us, so that they must be of very exceptional occurrence; yet as they show the possibility of cerebral disturbance without precedent or accompanying feebleness of the heart, it is enough to prove that they do now and then take place. We are tempted to add the following case as a still better proof that cerebral disturbance, the result of a shock other than traumatic, may give rise to the most profound prostration, without any prolonged continuance of cardiac weakness: A well known apothecary in Philadelphia was making a mixture of certain medicines in a large mortar, when they exploded with such violence as to break the windows of the store, crack bottles and jars, and deeply indent the board on which stood the mortar. Both he and his assistant were thrown down. Both suffered rupture of the tympanal membrane of the right and left ear. The assistant felt no marked constitutional effects, and got well with good hearing, but with a constant buzzing in the left ear. The apothecary himself, of a more nervous temperament, and perhaps, also, because he was standing nearer to the point of explosion, was, he thinks, insensible for a moment. When seen by one of us a few minutes later he was lying on a bed, with a pulse of rather remarkable strength, but now and then losing a pulsation, and altogether irregular as to rhythm, beating seventy one minute and eighty the next. His manner was excited and hysterical. He talked incessantly, and his limbs were in continual agitation, with occasional twitching of the facial muscles. The tympanal membrane was split across in his left ear, and on the right side presented a triangular opening. He had no headache, but complained of the roaring, hissing, etc., which seemed to be sources of the utmost annoyance. Despite his desire to move about, his muscles were extremely feeble, and for twenty-four hours he was unable to walk without aid. He recovered readily, both membranes healing completely, and his hearing none the worse for the accident. The patient, it should be noted, was not injured by his fall, and as we have seen, showed no signs of concussion. He, as well as his medical attendant, attributed the phenomena which he exhibited to the shock given to the auditory nerve. This opinion has since been confirmed by the cases reported by M. Brown-Séquard and others.

"Further on we shall show that in rare cases gunshot wounds cause partial or very general paralysis of grave type and prolonged duration in parts not directly injured; we shall also show that these protracted paralyses must be due to an equally permanent affection of the nerve centres. Now, if this be possible, there is every reason to believe that a temporary, though general, paralysis may take place in a large number of gunshot wounds. When the cardiac centres feel the shock most severely the feebleness will of course be greater; but there is much reason to suppose that the cerebral and spinal centres in general suffer *en masse* in every case of loss of consciousness from shock.

"As we proceed we shall have occasion to discuss the mechanism of the more permanent forms of reflex paralysis. Here we desire only to show that the effect of grave wounds is to cause a condition of the centres which gives rise to a general and profound feebleness, and that in rare cases the central effect is so intense as in some way to cause paralysis, which may last for hours, days, or months.

"Another class of nerve affections demands some notice before we discuss the undoubted instances of reflex paralysis from wounds which have fallen under our notice. These are what the French writers call cases of injury from commotion. They differ from those we have described in being due to the mere mechanical effect produced upon the neighboring parts. If, for example, a ball passes near the spinal column, it is conceivable that the roll of its motion and the resistance of the tissues may determine in the spine a brusque and sudden oscillation of the contents sufficient to cause very grave results.

"We have sometimes seen this illustrated in a very interesting shape and in a less dangerous form. Thus, in the case of a soldier who was shot at Gettysburg, July 3, 1863, the ball entered the cheek, and passing outside of the ramus of the jaw was cut out of the trapezius muscle. It struck the ramus, but did not fracture it or interfere with the act of mastication. In October, one or two very minute morsels of bone escaped from the neck in front of and four inches below the jaw. The only injury to the jaw bone must have been on its exterior surface, from which the pieces of bone alluded to worked down the tissues of the neck. The shock caused complete paralysis of the inferior dental nerve, with absolute anæsthesia, analgesia, and loss of sense of temperature in the lower lip and chin of the injured side. The sensation was for the most part rapidly restored by the use of cutaneous faradization after the nerve had been allowed time to recover from the results of the shock it had sustained. A portion of the lip, the skin below it, and the mucous membrane within still remain rebellious to treatment.

"The other case of mechanical shock to a nervous structure we shall report more at length. It is one as to which there may reasonably exist some doubt whether to call it an instance of commotion of the spinal cord from injury of neighboring parts, or to regard it as an impression made upon the spinal centre through the injured nerves, and resulting in a paralysis, as the reflected result of the state into which the centres were thus thrown. It is impossible to be sure that both sets of causes may not have been at work.

"*Flesh Wound of Back of Neck; entire Aphonia and Paralysis of all four limbs; speedy recovery, the right arm remaining weak.*

"Morgan Emory, aged 20, farmer, born in New York, enlisted September, 1861, in company 'C,' 9th New York Cavalry, a healthy man. August, 1862, had typhoid fever, but recovered perfectly. On the seventh of July, 1863, he was wounded at Williamsport. The ball passed through the neck from side to side, posterior to the vertebræ, entering the left side one-half inch below the level of the angle of the jaw and two inches from the posterior middle line of the neck, and emerging on the right side at one-fourth of an inch lower down and two and a half inches from the same middle line. No bone has been discharged from the wound, nor is there any evidence of injury of the spinous processes of the vertebræ. *Effect of wound.*—He fell from his horse, striking upon his right shoulder and bruising it slightly. He was speechless for fifteen minutes, and could neither stand nor move either arm. He acquired partial use of his left arm and of his legs in three or four days, and in a week could walk; his right arm improved very little. *September* 21, 1863; *present condition.*—With the exception of slight numbness of the left hand, his right arm is his only trouble. He has no power to move the right shoulder and elbow joints; the wrist and fingers he can move slightly. He has a burning pain in the fingers, most marked when the hand is cold. Sensation of touch is generally good. The circulation in both hands is bad—the right is colder than the left—the right biceps and pectoralis major are hyperæsthetic. *Galvanic test.*—Electro-muscular contractility and electro-muscular sensibility slightly diminished in all the muscles of the right arm. The shoulder joint is susceptible of passive movement, and seems not to have been injured permanently by the fall; the shoulder muscles are not wasted. It seems that for some days after the wound his skin was hyperæsthetic from the level of the wound down to the waist, so that a fly on the skin gave pain, although deep pressure did not. The muscular hyperæsthesia is of later date. *Treatment.*—Douche to arms; passive motion and electricity to right arm and shoulder. Three weeks later the electro-muscular contractility of the shoulder muscles was as good as on the other side. In the triceps the electro-muscular properties were lessened; in the forearm and hand both were as usual. Continued to faradize daily. The faradization was used up to November 1st, when he was furloughed. At this time the electro-muscular contractility and sensibility of the muscles were as good on the right side as on the left. He has recovered all the motions of the elbow, wrist, shoulder, and hand, but all are more feeble than those of the left arm, which is still a little numb, although far less so than when admitted. The burning pain which at first annoyed him is now rarely felt, and the hyperæsthesia of the muscles is nearly gone. On his return from furlough he was still better, and within a month was returned to duty. The fall upon the shoulder was incompetent to cause all of the symptoms here described, and since, in other cases where this element of doubt was absent, we have seen paralysis caused by commotion, therefore we see little reason to hesitate in assigning it as the producing cause of the paralysis in the present case; moreover, there was no paralysis of cerebral nerves, and the loss of power lay chiefly in the range of those nerves over whose spinal origin the ball passed.

"In many of the cases of injuries of the brachial plexus which we have observed it was quite impossible that the nerve tissue could have been directly injured by the ball, and in some of these at least the resultant paralysis must have been due to brief compression of their trunks during the movement of the missile or to agitation of the nerves through the tearing of tissues more or less remote.

"As we shall return to this subject in a future essay, it is only necessary here to describe cases of commotion so as to separate them from those of true reflex paralysis, with which they might easily be confounded. We have met with another and very interesting form of paralysis which might possibly be mistaken for reflex paralysis by a superficial observer. Men who are forced to use crutches, and to bear heavily upon them, are sometimes affected with numbness of one or both hands, and even with loss of motion in these members. This result is due to pressure upon the axillary nerves. It is most apt to occur in emaciated persons and those of large frame. Where it presented itself early in the case, as it may do, it might readily be attributed to reflected irritation. It is then easily relieved by laying aside the crutches, or by padding them and adding a handle by which to support the weight of the body on the hands. When the cure is delayed, faradization always affords prompt relief.

"We have seen that in all probability the state of shock from gunshot injuries is a state of general paralysis. We have also seen that in the great mass of cases it is temporary. We have now to show that in rare instances the paralysis continues as a more or less permanent evil after the general depression has passed away. When, therefore, a wound occurs, and the patient surviving the first effect is found to have paralysis of a distant limb or limbs, it is impossible to deny to such cases the title of reflex paralysis. All of the following instances seem to us to have fulfilled every condition which would entitle them to be so considered:

"CASE I.—*Ball Wound of Right Side of the Neck, probably involving no important nerve directly; fracture of hyoid bone; wound of throat. Reflex paralysis of left arm; probable reflex paralysis of right arm; early recovery of left arm; partial and remote recovery of right arm.*

"Captain R. N. Stemble, U. S. N., aged 49. While commanding the ram Cincinnati, May 10, 1862, the ship was attacked by two rebel rams. Captain S. was aiming a pistol when a ball entered his right neck, broke the hyoid bone, and traversing the neck emerged three and a half inches from the middle line, above, and to the right of the superior angle of the scapula, through the edge of the trapezius muscle. He fell half conscious and confused, but, soon reviving, felt that both arms were paralyzed. His first impression was that he was shot through both arms. He was carried below in great pain and spitting blood freely. The pain in the arms was made worse by movement and by passive motion. Pressure gave him pain in the right arm and shoulder only, and in the right chest. Sensation was never entirely absent from either arm, but was dull in both. His medical attendant, Dr Judkins, of Cincinnati, who took charge of his case on the 19th of May, 1862, writes as follows: 'When first seen by me the anterior wound was discharging mucus and pus with saliva. His voice was hoarse; deglutition, which returned in part on the third day, was still difficult and painful. He experienced severe pain in the supra-hyoidean group of muscles and in the pharynx. His left arm was still slightly paralyzed, having rapidly improved. On the right side the deltoid, biceps, triceps, and brachialis anticus were completely paralyzed, and up to the date of this account, July 9, 1862, have improved very little. The muscles of the right forearm are nearly as much paralyzed as those of the arm, and the sensibility of the right arm has become painfully acute. Captain S. seems also to have lost to a great degree the use of most of the shoulder muscles on the right side.' The left arm was nearly well in four weeks, the sensibility and movements of both improving equally, so that now, July 18, 1863, he has no loss of function in the member except slight want of tactile sensation in the ultimate distribution of the ulnar nerve. The right arm was but little better at this date, but the forearm had acquired every movement except supination, which seemed to be limited about one-half, not by paralysis, but by contraction of the opponent group of pronating muscles. At this period sensation was entire in the right limb, but there was soreness on pressure in all the anterior arm muscles, and neuralgia in the arm and forearm. The nutrition of both arms was good, but the right was the smaller, measuring at the biceps 9¾ inches, while the left measured 10¾ inches. During the slow progress of his case Captain Stemble lost several small pieces of the hyoid bone, and although hoarse for many months has recovered his voice without serious change in its tone or power. His convalescence, interrupted by many accidents and by an attack of pneumonia, continued up to the summer of 1863, and was largely due to the skill and care of his able medical attendant, Dr. Judkins. When placed under treatment, in Philadelphia, by Dr. Mitchell, July 18, 1863, Captain S. was still suffering from constant pain in the right arm. The left was well except as to the trifling loss of sensation mentioned above. The right forearm, though weak, possessed every movement except supination, as did also the hand, but the arm hung at the side useless, because there was scarce any abducting power and very little flexion at the elbow, both the biceps and long supinator being greatly enfeebled, and the former muscle, as well as the brachialis anticus, almost entirely atrophied and lost to view. Excepting the trapezius and rhomboid muscles, all the shoulder group was nearly useless and partially wasted. From July 18th to September 9th he was faradized, at first every day, and then every third day. Active and passive movements which had already been employed being of course continued. The result was a steady gain, ending in a cure as complete as could be hoped for in a case so severe. He regained every lost motion, and could raise his hand to his chin and abduct the arm about fifty degrees. The pronators alone remained intractable, despite every effort, but as the supinators and biceps developed themselves largely, even pronation gained somewhat, though not to such an extent as the other movements. The pain and hyperæsthesia diminished, but the former still exists. It is believed that a second course of similar treatment, about to be instituted, will further amend this case, in which all other means had utterly failed. Dr. Judkins is of opinion that the entire paralysis was due to reflected irritation. We incline to this belief for anatomical reasons, but even though we admit that the paralysis of the right arm may have been caused by commotion of the brachial plexus, it is impossible to suppose that the loss of power in the left member could have been similarly produced. The only permanent lesion on that side was the loss of feeling on the ulnar side of the palm and fourth finger. With this exception it regained its normal functions within three or four weeks. Whatever may have been the cause of injury to the right arm, it appears to have involved more or less nearly all the strands of the plexus, which is unusual in cases of traumatic injury from a ball. Its results were also more lasting than in the other arm. A year and two months after the accident the right arm was a useless member. Farardization of the muscles affected restored their power very rapidly, so that the patient regained every movement of the limb, which is still improving,—electricity having been temporarily laid aside in September, 1863.

"CASE II.—*Flesh Wound of Right Thigh, without wound of any large nerve; complete paralysis of all four limbs; speedy recovery of the left arm, tardy recovery of the other limbs, subsequent analgesia of the right side.*

"Jacob Demmuth, aged 21, Swiss, enlisted July, 1861, company 'D,' 108th New York Vols., a man somewhat below the average standard of height, of lymphatic temperament and moderate intelligence. Reports himself as healthy up to the date of his wound, which took place at Fredericksburg, December 13, 1862. He was marching at double-quick, when a fragment of shell as large as a musket ball struck his right thigh at the junction of the upper and middle thirds, directly over the femoral artery. The fragment did not enter deeply, but merely lodged in the leg, and was removed a day later without injury to the vessel. *Effect of wound.*—He fell half conscious, and although aware that he was wounded, he could not fix on the site of the injury until he had examined the limb. He felt instantly a burning pain in both feet, in front of the right chest and in the right arm, and in the right thigh about the wound. At first he was entirely powerless, but after a few minutes the power of the left arm returned, leaving him paralyzed as to motion in the right arm and in both legs. He lay on the field twenty-four hours, the weather being very cold. Sensation was defective in all the parts paralyzed as to motion. He had no pain in the back, but the burning pains alluded to above continued for a long time, and were always eased by cold applied to the wound. While the wound was healing he had headache and difficult, painful micturition. The wound closed in four weeks. During this period he regained the power to move the right arm, feebly and slowly, although perfectly as to extent. The pain in the side and feet also diminished, and the former disappeared altogether at a later period. He could not stand, however, or lift his legs from the bed at the time the wound healed, but there was then no headache or difficulty with the bladder or rectum. January 28, 1863, he was sent to Washington, where he improved so as to be able to walk with the help of a cane. His subsequent transfer to West Philadelphia caused a relapse; the pains returned, the paralysis increased, and he walked with difficulty on crutches. June 4, entered Christian Street Hospital. *Present state: Movement.*—The patient is partially paraplegic. He has some power to move the thighs when lying down, but cannot lift the legs from the bed. Below the knee all motion is lost, except a slight power of

flexing the smaller toes in both feet. Pressure upon the cicatrix causes feeble twitching of the anterior muscles of the right thigh; both legs are subject to cramp and twitchings, which increase at night. The left arm is strong, the right arm has all the normal movements, but all are slowly and feebly executed. *Sensation.*—He has shooting pains, which start from the seat of the wound and dart down the thigh to the knee. No other pain exists at present, but there is still a good deal of burning sensation in both feet alike. Localizing sensibility perfect everywhere. Tactile sensation normal, or very nearly so, in all parts of his body; no loss of sense of pain in the skin. Pressure or pinching of the muscles gives him more than the usual pain, so the muscles (of both legs, especially below the knees) may be regarded as affected with hyperæsthesia of common sensation. The left arm is in all respects normal; the right arm is also free from lesions of sensibility. *Nutrition.*—There is no special atrophy of individual groups of muscles, but both legs are slightly wasted, the right arm not at all so. The legs below the knees are relaxed and cold; the feet are congested, but not swollen to any marked extent. Along the edges of both soles there are singular purple and blue mottled spots, which he says existed from the time his boots were first taken off, twenty-four hours after he was wounded. It is possible that these marks are due to frostbite. The muscles of the legs are about equally irritable to induced electric currents. Unfortunately, no very perfect electric examination of their condition was made at this period. *Treatment.*—Regarding the case as one of reflex paralysis chiefly, he was ordered to have rough frictions, with cold to the spine, and to take the twentieth of a grain of strychnia three times a day. Under this treatment the cramps and twitchings increased, so that after three weeks the strychnia was abandoned. Every future attempt to repeat its employment caused the same increase of annoyance, without correspondent benefit, so that it was finally laid aside as useless or worse. About the middle of August a blister was placed on the cicatrix, with the effect of greatly relieving the burning in both feet. At the same time he was ordered to use the hot and cold douche to the spine alternately, and faradized daily. The electricity was persistently employed during two months, and a month later he was also treated with iron and quinine, porter and liberal diet. The electric treatment caused a rapid amelioration of his case, so that he soon left his bed and began to walk on crutches. Early in November he ceased to improve, and the treatment was abandoned. At this time he could use his right arm well and quickly, and walked unaided, although with a little unsteadiness of gait. No close examination was made as to his sensibility until December 3, 1863, because during this time he had been able to give aid in the wards, and made no complaint, except of more or less constant aching in the dorsal and lumbar regions of the spine. About December 3d he was closely inspected for discharge, when the following notes were taken: *Motion.*—Good in left arm; not so perfect in right arm. Both legs somewhat weak, so that he shuffles a little in walking, the worst movement being that of extension in the toes of the right foot. *Sensation.*—Tactile sensibility feeble in the right leg and right arm, but nowhere entirely lost; it is normal in the left leg and left arm. The sense of touch is first found to be feeble below the navel on the right side. It lessens in perfection to the knee, and is better below that part, especially on the inside of the calf, being worse in the foot. Tickling the sole causes no sensation of tickling on either side. *Pain.*—There is absolute loss of sense of pain in the right leg, belly, chest and arm, with somewhat lessened sensibility to pain on the left side also. In many localities he was able instantly to tell by the altered sensibility when the needle point crossed the median line; in others, this was more difficult. So complete was this analgesia that the most intense faradization of the nails of the right hand or of the right nipple caused not the least sensation. The penis remained sensitive, but all over the right side he could be cut or stuck full of needles without evincing the least consciousness of anything but a touch. The sense of temperature was good in the left leg, confused and uncertain at the upper third of the right thigh, and lost below the knee, where a heat of 110° Fahrenheit was felt as a touch only when the sponge wetted with hot water was applied. On the foot of the right side this degree of heat was unfelt in any form. Higher heat caused reflex movements, which did not tend to remove the limb from the irritant, but were merely convulsive in their character. Intense cold also gave rise to these irregular movements. *Electric examination.*—There was some difficulty in determining the state of the muscles as to their electric sensibility, owing chiefly to the want of intelligence in the patient and to the fact that he spoke an impure German patois, which made it no easy task to obtain from him a clear statement of his feelings. The electro-muscular contractility is slightly diminished in the right leg and arm; it is much impaired in the extensors of the toes on both sides; everywhere the muscles respond slowly. The patient was discharged December 14, 1863.

"CASE III.—*Wound of Right Thigh, with probable commotion of right sciatic nerve; partial paralysis of right leg; reflex paralysis of right arm; speedy recovery of arm; history unfinished.*

"William W. Armlin, aged 23, born in New York, farmer, enlisted August, 1862, in company 'D,' 134th New York Vols. Healthy before enlisting, and, except a slight typhoid fever in the fall of 1862, healthy up to the date of the wound, July 1, 1863, at Gettysburg. While kneeling on the left knee, the right knee bent at a right angle, he was shot in the right thigh on a line with the internal condyle of the femur, ten inches above it, and a little anterior to the artery. The ball passed upward, backward, and outward, and emerged two inches below the tuber ischii, and one and a quarter inches external to it, just above the fold of the nates. Dropping his musket he fell on his face, weak, but not insensible; the right leg violently flexed for a moment. He felt very feeble, but especially so in the right arm, with which he vainly tried to aid himself. After a half hour the bleeding, which was not excessive, ceased, and he was able to stand on the left leg, but not on the right leg, and had scarcely any use of the right arm, which, it should be noted, was in no way hurt when he fell. He managed to bind up the wound with a water dressing, and, occasionally renewing it, lay two days on the field. When hit he perceived no pain, but within an hour a burning attacked his instep, and has never left it, remaining neither worse nor better. Sensation, he is sure, was unaltered except on the sole; motion improved slowly, except in the flexors and extensors of the foot and toes. To his surprise the feebleness of the right arm increased after he was put in bed, and indeed notably after the second day. Up to October 28th it improved slowly, but at this time he went home on furlough, and began to use a crutch, which again so weakened the arm as to alarm him and deprive him, as at first had happened, of the power to feed himself. Rejecting a crutch on this side, he used a liniment on the arm, and it has now gained so much as to have about one-fourth the force of the left arm. It did not lose sensation at any time. Present state. December 14, 1863.—General health good. *Nutrition.*—Wounds healed. Leg below knee wasted, foot swollen, toes blue. Contraction of great toe in flexion. Measurements, 8¾ inches above internal condyle the thigh measures, right 16, left 17⅜ inches; middle calf, right 11½, left 13 inches. *Voluntary motion.*—He lifts the right thigh well, but complains of its weight. Knee motions very fair; has no extension or flexion of the foot or toes. *Sensation.*—Tactility absent in sole of right foot, feeble in second toe on its dorsal face, absent on top of third toe, but elsewhere complete. Localization extremely confused, so that a touch on the toes is felt, but is referred to the instep. Surface analgesia of the sole, but deep pricking with a needle is felt in the sole. Hyperæsthesia of the posterior thigh muscles to a slight degree; marked soreness on pressure in the calf muscles, the short extensors of the foot, and its whole dorsal surface as well as the inside of the sole. *Pain.*—The pain lies deep in the calf and extends outside, under and in the peroneal muscles, down the front of the leg, and over the dorsum of the foot, and to the external side. It is intense in the dorsum, but nearly absent in the sole. Water does not seem to ease the pain, which is of a burning character 'like mustard.' Hitherto nothing has aided it. *Electric test.*—The thigh muscles respond well. The right tibialis anticus has no electro-muscular contractility, but its electro sensibility is highly exalted, as is the case in all the muscles down to the foot. In the foot the electro-muscular contractility and sensibility are both lost, except that in some parts of the dorsum the sensibility cannot be tested readily for various reasons. It is certainly lessened. The right arm is still very feeble, especially below the elbow, and has lost in size. It measures comparatively as follows: Dec. 20th, right forearm 8⅝ inches, right arm 9 inches; left forearm 9¼ inches, left arm 9⅝ inches. He is not left handed. The arm is improving; the leg has remained unchanged during some time past. Ordered, first, a blister over the whole dorsum pedis. Dec. 23d.—This has caused great relief and is to be repeated. The complete history of this case will be detailed elsewhere. Up to this present date, February 1, 1864, the burning pain in the foot has been relieved, and the hand and arm have entirely recovered under the use of the douche, active exercise, and electricity.

"The following cases are equally instances of reflex paralysis. We regret that, owing to circumstances not under our control, they are less complete as to their symptoms and history than we should have desired:

"CASE IV.—A Sergeant was shot, during the battle of Malvern Hill, in the right testicle. This organ was nearly entirely destroyed by the ball. He fell without pain, believing himself wounded in the back. A few moments later he became senseless. Recovering after a few minutes he discovered that he could walk, but that the right foot dragged when he attempted to lift it during the effort to get to the rear. This weakness remained permanent for several months, and was relieved by faradization, and shampooing soon after the testicle healed. The flexors of the foot on the left leg were completely paralyzed to voluntary control, but responded to the irritation of the induced electro-magnetic currents. There was no loss of sensibility.

"The next case was observed by one of us in the U. S. A. General Hospital, Sixteenth and Filbert Streets. Unfortunately no notes were taken at the time, which will account for the brevity of the details:

"CASE V.—An officer was struck by a small fragment of shell upon the external side of the left thigh. He felt pains of a smarting character in both thighs at or about the same spot, and was impressed for a time with the conviction that he had been shot through both thighs. The shell wound healed in the course of three or four months. During this time he had occasional smarting on the outside of the sound thigh. This gradually disappeared, and at length he noticed accidentally that there was a space of skin about five inches square, on the outer part of the sound thigh, in which there was neither sense of touch nor of pain. When examined by us, he could indicate the boundaries of the anæsthetic space very readily by the loss of tactile sensations when a body, moved while in contact with his skin, was made to cross the line on to the numb parts. These bounds were always very accurately the same. He returned to his regiment without any improvement having taken place in regard to anæsthesia. It is difficult, as it appears to us, to refer either this case or the last to any cause except a reflex effect. The interest of the case just now recorded lies partly in the fact that at the time of the wound the patient felt a sensation which he referred to the part which afterward became deprived of sensation.

"The following case is a still more remarkable instance of the same peculiarity, and is also instructive from its resemblance to Case III, that of Armlin, in whom a gunshot wound of the right leg also caused reflex paralysis of motion only in the arm of the same side:

"CASE VI.—*Gunshot Wound of Right Thigh; lesions of motion and sensation; reflex paralysis of right arm as to motion.*

"Daniel Kent, aged 24; Pennsylvanian; farmer. Enlisted August, 1862, company 'B,' 145th Pennsylvania Volunteers. Healthy until wounded. At Gettysburg, July 2, 1863, while charging at a full run, the leg raised up, he was shot in the right thigh 10½ inches above the edge of the patella, directly over the rectus. The ball made its exit on the postero-internal surface of the thigh one inch below the fold of the nates. It seems to have passed inside of the bone and could not have hit the sciatic nerve. He fell at once, quite conscious, and feeling an instant stinging pain all over the right side of his body, and especially in the arm. He lost a great deal of blood, and found that he could not sit up without giddiness. His wound was dressed in six hours, and he was on the field thirty-six hours. The leg lost all motion and some sensation, and the tingling pain in the arm left him within twelve hours. He remained in bed six weeks, and then was able to walk on crutches. The sense of touch changed but little during the time which has since elapsed, and the power of movement in the leg has remained unaltered since August 1, 1863. The wound healed in October, with some previous loss of bone. Since October the wounds have twice reopened to give exit to small pieces of bone. Except an attack of ague in October, his general health has been good. Present condition, December 26, 1863: *Nutrition.*—The leg is healthy in color; the foot swells when hanging down. The right thigh, eight inches above the patella, measures 19 inches in circumference; the left measures 19¼ inches. The right calf measures 14½ inches; the left calf measures 15 inches. *Sensation.*—No pain anywhere; tactile sensibility entire; sense of locality healthy. *Motion.*—The thigh is voluntarily flexed very slightly, and only through the agency of the psoas muscle, the anterior thigh muscles refusing to obey the will; abduction and adduction of the thigh normal; extension of the thigh is normal; extension of leg none. The foot is almost moveless, except that the will can cause feeble flexion of the toes and slight eversion and inversion of the foot. *Electric examination.*—The rectus muscle has its electro-muscular contractility somewhat lessened; that of the two vasti muscles is lost until the wet conductors reach the upper parts of the muscles (three inches above the wound), where this properly becomes normal. The sartorius has its electric contractility diminished. Below the knee the peroneus longus responds very well, but, with this exception, none of the leg muscles stir under the most powerful induced currents. The short extensor of the toes and the interossi still possess some power to contract under electrical stimulus. Throughout, the electro-muscular sensibility is diminished in all the muscles which have suffered in their contractile power, and the sense of pain seems also to be materially lessened since dry electric conductors, with strong currents, cause no pain when applied to the bones or nails of the foot. The history of the arm, which was reflectively paralyzed, has been reserved for separate detail here. After three days from the date of the wound the right arm, which had remained feeble, became so completely paralyzed that the patient could no longer raise it to his lips; under the use of a stimulating liniment it grew better until he used crutches. Probably owing to their employment he became much worse, but gradually improved again up to this present date of January 6, 1864. The right and left arms measure nearly the same; power of right arm one-fourth that of left. *Electric examination.*—Electro-muscular contractility normal: electro-muscular sensibility somewhat lessened. *Treatment.*—Faradization of arm daily; alternate hot and cold douche, and active motion. On close examination, soon after admission, some evidence of tubercle was found in the right lung, and the patient was therefore ordered to be discharged January 20, 1864.

"CASE VII.—*Wound of Right Deltoid; sensory and slight motor paralysis of right arm; speedy recovery.*

"Michael Farrell, aged 28; farmer; born in New York; enlisted September, 1861, company 'I,' 20th New York Vols.; a vigorous, healthy looking man—was well up to date of enlistment. At Fredericksburg, December 13, 1862, he was shot in the left shoulder while lying down. The ball entered the erector spinæ mass of muscles on the left side on a level with the lower angle of the scapula, and passing upward and outward, lodged under that bone; the wound healed readily, the ball remaining. February 3d, went to duty. July 1, 1863, a small ball passed through the right deltoid muscle three inches above its insertion into the humerus. The ramrod fell from his hand and the arm dropped. He retired to a hospital, and on examination found that although he had all the movements of the arm he had no sensation. During the next four days he was exposed to the sun a good deal, and the arm, being bare, was blistered, which, he says, to a great extent restored its feeling, which has since gone on improving. There is now, July 25, 1863, some slight paralysis of motion, but all the movements are feeble, and those of the arm painful, owing to the contractions about the ball track; the arm improved, and the man was returned to duty Oct. 22, 1863.

"Before proceeding to discuss the causes which give rise to reflex paralysis, it will be useful to analyze the symptoms of the preceding cases so as to learn how they differ and in what respect they resemble one another.

"*Relation of the seat of the wound to the part or parts paralyzed.*

"CASE I.—The wound involved the muscles of the neck or throat, and the hyoid bone. Result: Paralysis of both arms and of the neck. CASE II.—Fragment of shell; wound of muscles over and external to the right femoral artery. The injury may have caused concussion of the crural nerves, and thus much of traumatic paralysis. Result: Reflected paralysis of the right arm and leg and the left leg. "CASE III.—Probable injury of the sciatic nerve—(commotion). Result: Reflex paralysis of the right arm. CASE IV.—Ball wound of right testicle; paralysis of right anterior tibial muscles and peroneus longus. CASE V.—Wound by fragment of shell in external side of left thigh; paralysis of tact on a corresponding part of right thigh. CASE VI.—Ball wound, probably involving the crural nerves. Result: Paralysis of right arm. CASE VII.—Ball wound of deltoid muscle; sensory and slight motor paralysis of same arm. There is no evidence in this case that the ball struck the bone or directly injured any large nerves, since even the deltoid itself had nearly full power when the patient was first examined by us. In three of these cases the leg was hit, and the arm of the same side was paralyzed. In three cases the paralysis affected the opposite side of the body; and in one the paralysis of tact and pain was observed to have fallen upon a space symmetrically related to the wounded spot as regards position. No general law, therefore, can be deduced from these records, nor, from what we see in the causation of reflex paralysis from disease, should we expect to find any inevitable relation between the part injured and the consequent paralysis. The constitutional condition at the time of the wounding, as to excitement, mental and physical, may possibly have to do with causing the resultant paralysis.

"Of the seven cases above reported, two were in active movement, two were standing about taking aim, one was kneeling, and of two we have no information as to this point. It may prove, upon examining a larger number of cases, that a man wounded when moving violently, or when excited, is more than another liable to reflex paralysis, but as yet we are not entitled to such an inference. In most of our cases the constitutional effects were instant and severe, and could not therefore have been due to the loss of blood, which in some of them was copious. Four of the seven cases had stinging, smarting, or burning pain in the part paralyzed reflectively. The pain was an early symptom, which disappeared in all of them after a time. In three cases no such pains were complained of.

"The after history of these cases is extremely curious. However grave the lesion of motion or sensation, it grew better early in the case, and continued to improve until the part had nearly recovered all its normal powers. In almost every instance some relic of the paralysis remained, even after eighteen months or more from the date of wounding. In some the part remained weak, in others there was still left some slight loss of sensibility, and in two the loss of power and of sensory appreciation was very considerable. In a case of reflex paralysis from a wound we have, therefore, some right to expect that the patient will recover rapidly up to a certain point; then in most cases a small amount of loss of power or sensation may remain. The future history of our own or other cases may determine hereafter whether the recovery is ever quite complete. In CASE I, the more prominent results were only the continued lesions which had been noted early in the case. In CASE II, the permanent lesions were chiefly of secondary character, and were at all events additions to those which were first observed. In no other case were similar phenomena noticed. In two of the seven cases there were lesions of sensation and motion; in three, motion alone was lost; and in two the sense of tact and of pain were affected without other loss of function. The extent and duration of the induced paralysis have already been considered.

"Of the treatment we have very little to say. In Captain Stembel's case the left arm recovered without treatment in four weeks, leaving only a slight loss of touch in the terminal distribution of the ulnar nerve. The right arm, which we also regard as reflectively paralyzed, recovered sensation early, but was useless as to motion, until it was treated and cured by faradization eighteen months after it was first injured.

"Demmuth, CASE II, came under our care seven months after he was wounded; as to his previous treatment we know nothing. In our hands strychnia not only failed to aid him, but did harm. He was rapidly relieved by faradization, active and passive movement, and the douche, with iron, quinine, and liberal diet.

"Armlin, CASE III, used a liniment on the paralyzed arm with some improvement. Faradization has restored it completely. CASE IV.—Relieved by faradization. CASE V.—No treatment; lesion of sensation only. CASE VI.—Kent. A stimulating liniment applied upon the arm seems to have been of use. As in Case III, the employment of crutches caused a relapse. CASE VII seems to have been accidentally benefited through the blistering to which the arm was subjected after exposure to the sun—a useful hint in like cases. No other treatment was employed. Although long periods had elapsed in every case before we examined them, in only one, that of Armlin, Case III, was there any very notable wasting. And even in this patient the loss was generally throughout the member, and may be readily ascribed to mere lack of use. In none was there atrophy, such as characterizes lesions of nerves, and certain rheumatic and other palsies, save, perhaps, in the doubtful instance of the right arm in CASE I.

"The electric examination was made at periods so variable in the several cases as not to permit of any useful comparison of results, and has been stated in each case merely for future use and reference when more cases have been reported. In only one case did the muscles display great loss of contractility when faradized, and in this, No. 1 of the series, the limb in question was the right arm, as to which alone some doubt may exist concerning the cause of the paralysis. The ultimate causation of these very singular and hitherto undescribed affections is the last point which we shall consider. The problem before us may be simply and briefly stated; its solution is a task less easy.

"A gunshot wound occurs, involving large nerves or not, and we have instantly a paralysis of motion and sensation, or of either alone, in some part of the body more or less remote. How shall we explain this? Although we have long been aware that certain forms of disease are capable of causing paralysis of distant organs, of altering secretions and affecting nutrition, we have had no plausible theory of the causation of these effects until M. Brown-Séquard attempted to account for them in a manner equally simple and ingenious. Recalling the fact that irritation of the vaso-motor nerves is capable of producing contraction of the blood-vessels, he inferred that when an external nerve is violently or permanently excited it may be able to produce contraction of the capillary vessels of the nerve centres and thus give rise to paralysis. It seems unlikely, even if we admit his explanation, that the capillaries could remain contracted for any great length of time. But it is possible that the alteration of nutrition, which this temporary anæmia causes, may give rise to one of two results—either a continued disturbance of nutrition, which, however slight, would occasion grave results if it existed in a nerve centre, or secondly, to a paralysis of the capillaries of the nerve centre involved.

"We suppose, first, the existence of an exterior nerve lesion; secondly, a consequent irritation of the vaso-motor nerves in a limited part of the spine; contraction of its capillaries, anæmia, nutritive changes, and finally, a relaxation of these vessels, which would be more apt to be a lasting condition, and would in fact constitute congestion. Such a series of consequences may very possibly occur, and would no doubt be competent to cause a paralysis whose site, extent, and character would depend upon the part of the nerve centres affected by the excitation. With so satisfactory an hypothesis before us in this modified shape, it would seem needless even to suggest any other explanation. But in a region of research so little explored, it may be allowable to point out the fact that another mode of explanation is at least possible, and the more so, since there exist certain objections to M. Brown-Séquard's manner of viewing the subject. It is to our minds improbable that contraction of the capillaries can continue for any great length of time. There is no experiment on record to show that this can be, or that it ever occurs in a nerve centre. We have therefore added the suggestion of consequent, and why may we not say primary, paralysis of these vessels. Here we have firmer ground for opinion, since it has been most distinctly shown that in section of the sympathetic nerve this result does take place, and is singularly persistent. But whether the blood-vessels remain contracted or dilated, nutritive changes would occur, and these the pathologist has failed to find. If now we ask ourselves the question whether it may be possible to blight or exhaust utterly the power of a nerve centre, without the intervening mechanism of contracted or dilated blood-vessels, we are tempted to think that such a result may be producible.

"It appears to us possible that a very severe injury of a part may be competent so to exhaust the irritability of the nerve centres as to give rise to loss of function, which might prove

more or less permanent. A strong electric current, frequently interrupted, is certainly able to cause such a result in a nerve trunk, while a general electric shock, as a stroke of lightning, is, as we well know, quite competent to destroy the irritability of every excitable tissue in the economy. Now if the former of these results can occur in a nerve so insulated as practically to have no circulation, the loss of irritability cannot be set down as due in such a case to a defect of circulation. Reflecting then upon the close correlation of the electrical and neural force, it does not seem improbable that a violent excitement of a nerve trunk should be able to exhaust completely the power of its connected nerve centre. The central change thus brought about would no doubt involve the consequent or immediate occurrence of chemical nutritive changes, which would gradually yield as time went on. While this view seems to us adequate to explain the facts, the notion of vaso-motor irritation and capillary contraction (Brown-Séquard) does not appear to be competent to cover all the facts. We have pointed out that no one has ever shown that capillary contraction can exist as a permanent state in a nerve centre; while, on the other hand, it has been proven that section of a sympathetic nerve involves permanent dilatation of blood-vessels; but in the brain, which is supplied by the sympathetic of the neck, division of this nerve gives rise to no disturbance, although the side of the brain on which the section occurs grows warmer. However, it is probable that the whole supply of vaso-motor nerves to the brain does not come from the neck, while other organs, whose whole supply we can cut off, as the kidneys, do certainly suffer nutritive changes as a consequence of such sections.

"One or other of the two theories we have offered must therefore be called on to explain the central changes which give rise to reflex paralysis. Either the shock of a wound destroys directly the vital power of a nerve centre, or it causes paralysis of the vaso-moter nerves of the centre, with consequent congestion and secondary alterations. But there is no reason why, if shock be competent to destroy vitality in vaso-motor nerves or centres, it should be incompetent so to affect the centres of motion or sensation. Until the causation of these cases is better understood, it is vain to speak confidently as to treatment founded on a conception of the mode of their production. Experience has shown that the removal of the first cause, and in some instances the application of alteratives, as blisters to the cicatrix, prove valuable in relieving such induced pain as may exist. Further, that stimulating liniments or blisters to the affected member are useful, and that the local application of induced electric currents to the muscles is of the utmost service. The question of the use of internal remedies has yet to be decided by larger clinical experience. We, ourselves, have been unfortunate in that no chances have presented themselves of treating these cases in their early stages, when the causes which first produce the paralysis are present and before those later nutritive changes occur which, as we presume, are essential to the continued existence of the state of palsy. We have endeavored to show in this report that the condition called shock is of the nature of a paralysis from exhaustion of nerve force; that it may affect one or many nerve centres, and finally, that it may be so severe as to give rise in certain cases to permanent central nerve changes, productive of paralysis of sensation and motion, or of either alone.

"S. WEIR MITCHELL,
"GEO. R. MOREHOUSE,
"W. W. KEEN, jr.,
"*Act. Ass't Surgeons, U. S. Army.*"

The number of recorded cases of wounds of nerves of special sense caused by missiles is small. The following case of shot wound of the neck is interesting, and is regarded as a case of injury of the sympathetic nerve:[1]

CASE 1077.—Edward Mooney, aged 24 years, enlisted July, 1861, Co. C, 110th Pennsylvania. He was perfectly healthy before and after enlisting, until wounded at Chancellorsville, May 3, 1863. He was standing erect and was looking toward the left side, when a ball entered his right neck one and a half inches behind the ramus of the jaw, at the anterior edge of the sterno-cleido mastoid muscle. The ball passed across the neck, rising a little, and emerged immediately below and a half inch in front of the angle of the jaw on the left side. He fell senseless, and, judging from the movements of his regiment, may have so remained during half an hour. On awaking, he found his month full of clotted blood, which he pulled out. The bleeding did not continue. After a short rest he was able to walk nearly three miles to the rear, where his wounds were dressed with cold water. On his way he discovered that his speech had become hoarse, difficult, and painful, and that deglutition gave rise

[1] MITCHELL, MOREHOUSE, and KEEN (*loc. cit.*, p. 44) are of the opinion that this is a "case of injury of the sympathetic nerve, and if so, that it is the only one on record."

to great uneasiness and to burning pains. He says the sensation of pain was felt as though behind the pomum adami. After five days of great suffering and utter inability to swallow, he obtained some relief, but, for a month or more, was forced to swallow a mouthful of water after every mouthful of solid food. The power to swallow gradually improved, and is now as good as it ever was. A week after he was wounded he became able to articulate without pain, although still hoarsely. This difficulty also lessened by small degrees. At present, July, 1863, his voice is still a little hoarse. During his recovery, which was rapid, the wounds healing within six weeks, he had a good deal of pain in the back of the neck. He says that he had headache whenever, after the injury, he attempted to walk far or exert himself; but he describes the headache as chiefly behind the ear and in the back of the head, with some frontal pain. About one month after he was hurt a comrade noticed the peculiar appearance of his right eye and called his attention to it. A little later it began to be troublesome in bright lights, and has remained so ever since, with of late some change for the better. July 15, 1863: The pupil of the right eye is very small, that of the left eye unusually large. There is slight but very distinct ptosis of the right eye, and its outer angle appears as though it were dropped a little lower than the inner angle. The ball of the right eye looks smaller than that of the left. These appearances existed whether the eye was opened or closed, and gave to that organ the look of being tilted out of the usual position. The conjunctiva of the right eye is somewhat redder than that of the left, and the pupil of the right eye is a little deformed, oval rather than round. In a dark place, or in half-lights, the difference in the pupils was best seen; but in very bright light, as sunlight, the two pupils became nearly of equal size. The left eye waters a good deal, but has the better vision, the right eye having become myopic. In sunlight he sees well at first, but, after a time, observes red flashes of light in the right eye, and finally, after long exposure, sees the same appearances with the left eye also. He complains a good deal of frontal headache at present, and thinks that since the injury his memory has been failing, although of late it has improved. Has lost flesh and strength since he was wounded. About the 30th of August the patient rode to the office of Dr. Dyer, who examined his eyes with the ophthalmoscope, but found no abnormal retinal appearances. Mooney walked from Dr. Dyer's office to the hospital, an unusual exertion, as he was weak, and avoided exercise on account of the headache it caused. An orderly who was with him on this occasion remarked to one of the hospital staff upon the singular appearance which his face presented after walking in the heat. It became distinctly flushed on the right side only, and pale on the left. This fact was afterward observed anew by one of us. The patient had used exercise and had just come in. The right half of the face was very red. The flush extended to the middle line, but was less definite as to its limit on the chin and lips than above these points. He complained of pain over the right eye and of red flashes in that organ. A careful thermometric examination, made during repose, showed no difference in the heat of the two sides within the mouth or the ear. We regret that it did not occur to us to repeat this when the face was flushed by exertion. Under a tonic course of treatment he gained ground rapidly. The eyes became less sensitive, the pupils more nearly alike, the line of the lid straighter. He had several attacks of fainting after exposure to the sun, and these, with occasional diarrhœa, retarded his recovery. He was at last able to return to duty, and left for that purpose in October, 1863, nearly all of his peculiar symptoms having disappeared and his general health having been altogether recovered.

A case of neurosis, involving different branches of the sympathetic nerve, is reported by Acting Assistant Surgeon L. K. Baldwin:

CASE 1078.—Private Hiram Voight, Co. E, 13th Massachusetts, was admitted into ward O of the West Philadelphia Hospital on December 16, 1862, with a cicatrized shot wound of the right arm, producing paralysis of the ulnar nerve. Soon after admission he had congestion of the kidneys, with scanty acid urine, which he passed with difficulty. Of this he was soon relieved by acetate of potassa with sweet spirit of nitre, conjoined by demulcent drinks and fomentations to the spine. On January 16, 1863, he was attacked with palpitation of the heart and violent dyspnœa, coming on in paroxysms, chiefly during the night. He was of German birth, medium sized, with dark complexion and good physical organization, about 24 years old.[1] After the exhibition of a mild laxative he was put upon the use of tincture of assafœtida, with the application of a belladonna plaster to the cardiac regions. No tenderness of the spine was manifested upon pressure. Tincture of valerian was given along with the assafœtida upon the recurrence of the dyspnœa, which resembled spasmodic asthma, and this plan of treatment was pursued for several days. On February 14th the impulse of the heart was so considerable that five drops of tincture of veratrum viridé were given; but its discontinuance was soon demanded, and the antispasmodic treatment, with tincture of valerian in addition, was resumed. On February 17th the dyspnœa was less violent and of shorter duration; but he began to complain of general tremulousness with great nervous irritability. The tongue became furred and yellowish, with slight headache and feverishness, which were relieved by the use of five grains of blue mass at night and slight laxatives in the morning. On the 20th he had great cardiac agitations with some dyspnœa and general nervous tremulousness. His strength was also failing. Pills containing one grain of sulphate of quinine and two grains of extract of hyoscyamus were given four times daily, with a teaspoonful of compound spirit of sulphuric ether at times of paroxysms. On the 24th he felt better, but a repetition of the mercurial was demanded by the state of the tongue, etc. Still had paroxysms of dyspnœa at night, with twitchings of facial muscles and great nervous agitation. Mental functions were also somewhat disturbed. On the 27th he was attacked with vomiting, which caused him great distress. He had no appetite and his stomach rejected everything. His pulse was moderately full and regular, but his countenance and general movement indicated great malaise, and he seemed almost as if insanity were impending. His face became flushed, with general heat of skin, and thirst, and a recurrence of the furred tongue, with constant vomiting. He was again put upon the use of blue mass with aromatic syrup of rhubarb, which soon produced a favorable change of the gastric symptoms as well as his general condition. Paroxysms of dyspnœa had now in a great measure passed away. The pulse had become regular and firmer; but still his stomach remained irritable and non-retentive. On March 5th his symptoms had a little improved, but he was very restless at night, and still gave evidence of great nervous irritability, which were thought to be clearly traceable to an affection of the ganglionic centres of the sympathetic nerve. Endermic applications of morphia to the epigastrium was tried for the relief of gastric irritability, but without apparent benefit. The stomach remained rebellious to the reception of everything which was taken into it, and could not be subdued by any medicinal or dietetic measures which were prescribed. Notwithstanding the obstacle to proper nutrition, his strength was quite well maintained and no

particular emaciation was observed. Being a German, lager beer and hock wine were temptingly offered him; but with no successful result. In this way he continued for several days longer, being fortunately, however, now relieved of all pulmonary and cardiac symptoms. All medicine was suspended, and on March 30th he first expressed a desire to be discharged and sent home. This wish was acquiesced in, and he was discharged from service April 18, 1863, and pensioned. Examiner G. S. Jones, of Boston, reported, December 21, 1867: "He now has partial paralysis of his left hand, which impairs its power and usefulness. There is no evidence of nervous debility or softening of the brain."

The following two cases of shot wounds of the *portio dura* nerve, seventh pair, are copied from Mitchell, Morehouse, and Keen, pp. 47, 51:

CASE 1079.—Private John C. Dyre, Co. E, 71st Pennsylvania, aged 19 years, was wounded at Gettysburg, July 3, 1863. While aiming, a ball entered just behind the left ear at the level of the meatus. It broke the mastoid process slightly, and was said to have gone forward and downward. It has not been found. He fell unconscious, and reviving within about two hours at a hospital, where he had been carried, he found that he could not use the jaw, owing to pain in the ear. There was also pain in the left cheek and brow, left neck, shoulder, arm, and hand, together with the left chest. The left arm was weak for several days. He may have fallen upon it. The pain was a neuralgic ache, not the pain of a bruise. Water dressings were used after a vain search for the ball. Within two days he had pain in the lower teeth and jaw on the left side. After five weeks all the pains grew better rapidly, and at the same time the motions of the jaw returned. The ear was deaf from the first; but he does not know whether blood flowed from it or not, or when pus first came from it. *Present state, February* 14, 1864, *eight months after reception of wound:* The features are slightly drawn to the right in repose, and excessively so during laughter and speech. *Specimen* 1567, in the Army Medical Museum, is a cast of his face in repose. The left side is absolutely paralyzed. The inner canthus of the left eye is a little rounder than that of the right eye. The tears overrun the lid at times. Inability to close the lids on the left side, owing to which he has formed the habit of rolling the eyeball upward so as to cover it with the passive lid. He then supposes that he has closed the eye. Chewing on the left side causes pain in the teeth, which endures for some time. Sensation is perfectly normal on the paralyzed side. Motion is of course utterly lost in all the muscles of expression. *Electric test:* Not the slightest contractility exists in any of the muscles of expression on the left side, with a curious exception. The muscular layer of the orbicularis oris in the upper and lower lips still responds to the current, but more remarkably below than above. There, is, however, no voluntary control over these parts. The buccinator alone of the masticating muscles seemed to have its electric contractility enfeebled but not wholly lost. *Examination of Special Senses—Tongue—Motions:* The upward and backward motion of the base of the tongue is awkwardly performed. In most of its movements the tongue inclines slightly to the right side, and is capable of being drawn to the left side. The palate hangs a little to the right and acts imperfectly, so that *food is apt to enter the nose.* There is some further loss of power in the other muscles of deglutition, for he is often troubled by food entering the glottis, while at times it is thrust back again into the mouth. *Speech:* He pronounces many letters with difficulty or imperfectly, so that his speech may be said to be a little thick, and he so describes it, referring the trouble to his lips and tongue. The labials are of course affected, but the guttural sounds are also imperfectly executed. Taste is apparently impaired over the entire left tongue. It was examined by comparing its appreciations with those of the other side. *Electric state of Tongue:* No loss of its electric properties was detected. Hearing on the left side was destroyed. The back part of the bony meatus was carious and the membrane absent, perhaps from inflammation consequent upon the wound. *Treatment:* The patient was industriously faradized for several months without the least gain in any respect. The nerve may have undergone such changes as might make it impossible to restore to the muscles their lost properties. Dyre was discharged from service July 2, 1864, and pensioned. Examiner T. F. Harper, of Philadelphia, reported, January 30, 1869: "A gunshot wound in petrous portion of temporal bone of left side of head, causing superficial fracture followed by some exfoliation of bone. There has resulted a paralysis of seventh nerve, occasioning an impairment of vision of left eye; also a great deformity of the face, it being much contorted and twisted to the right by loss of power in the muscles of the left side of the face." The Philadelphia Examining Board reported, September 13, 1877: "Paralysis of left side of face, with loss of hearing, left ear, and defective sight in left eye. Deformity, overflow of tears, and inability to close eyelids. Ball supposed to be in temporal bone."

CASE 1080.—J. Gager, Co. M, 14th New York Heavy Artillery, aged 42 years, wounded at Spottsylvania, May 12, 1864. The ball entered the left posterior neck one and three-quarter inches from the spine of the third cervical vertebra, and was cut out immediately behind and below the left ear, about two and a half inches below meatus and a quarter of an inch behind the jaw. Its track is unknown, except that it injured the ear and paralyzed the portio dura of the seventh nerve and splintered the edge of the ramus of the jaw. His head, at the time he was shot, was thrown forward and downward. He fell, conscious, bleeding freely from the ear only. After two minutes he arose and walked away, the blood still *spouting* out from the ear, until it was checked by a bandage over that organ. He had no pain until the next day, when he had the usual inflammatory pains. His eyesight is said to have become affected on the second day, when there was, according to his account, a distinct difference against the left eye. Things appeared hazy to the left eye. This remains the same. The paralysis of the muscles was immediate, and his speech was made difficult. This seemed to him to come from a defect in the tongue and lips. Hearing was lost at once in the left ear. *Present state, June* 8, 1864: The pains in the face and the swelling, which was never great, are now better. The wounds are open but healing. The nutrition is unaltered. The lines of the face are lost, the tip of the nose and the lower mobile portions of the face are drawn to the right. The left eyebrow has fallen a little. The tears run over the edge of the lid. The tongue is perfectly movable and under entire control of the will. Speech perfect, except a slight difficulty in articulating the gutturals, and still more as to the labials. *Special Senses:* The left eye sees only one-third as well as the right. Hearing is lost in the left ear. On washing out the pus a mass of granulations was seen at the bottom of the ear. Possibly the bony meatus may have been fractured by the ball, but no bone escaped except pieces of the jaw, which came out with the ball. *Taste:* There seems to be no marked loss of gustation. Taste is dulled a little on the left side. Tactility is equally good on the two sides, both in the tongue and face. June 20th, the sight is becoming worse. Dr. Dyer is of opinion that it was affected before he received his wound. Induced electric currents give rise to slight movement in the left eyelid and the elevator of the

PLATE XXXVIII.—FACIAL PARALYSIS CONSEQUENT ON SHOT INJURY.

angle of the mouth. A rapid recovery was predicted, and, in fact, within three days later voluntary power returned in the orbicular muscle of the eye. By July 27th, every motion had been re-acquired.

An illustration of paralysis of the facial nerve with distortion of the face is given in PLATE XXXVIII, opposite. The patient suffered from loss of sight in the left eye and of hearing in the left ear.

Nerve trunks may be completely severed by a missile, or they may be partially divided and lacerated. They may be injured by the near passage of a missile causing concussion or "commotion," or they may be contused by a missile which has insufficient power to divide or lacerate, or which has expended its force on neighboring tissues. As in the case of arteries, their position and surroundings tend to protect them, and it is probable that their mobility and form may enable them to slip aside and escape damage from a passing missile.

Mitchell, Morehouse, and Keen (*op. cit.*, chap. 5, p. 55) add to the above more common forms of shot injury—those from cicatricial pressure, and those from the extension of diseased processes from wounded nerves to those which are healthy. The same authors consider injuries by contusion of a nerve to be those "most apt to be permanent and serious." The following case, taken from their work, illustrates the result of a contusion:

CASE 1081.—James Walton, aged 47 years, Ireland, sailor; enlisted June, 1862, Co. A, 115th Pennsylvania. At the second Bull Run battle, August 30, 1862, while lying on his belly in the woods, a shell, exploding in the air, cut off a large branch, which, falling, struck him on the left shoulder, or rather across the base of the neck. He grew dizzy, felt stunned, and lost consciousness. When he revived he had sharp pains down the arm to the hand. It was totally paralyzed as to sense and motion. Up to September 15, 1862, he was a prisoner. At this date, when exchanged, sensation was still absent, but motion was improving slowly. It gained, however, at the same time that atrophy was taking place in the very muscle whose power was returning. From September, 1862, to September, 1863, the motions grew better, with one exception; sensation returned to a perfect extent, and the muscles ceased to waste. January, 1864: The arms measure alike. The right forearm measures 10¼ inches, the left 9⅞ inches. The supinator longus and the extensor mass of muscles in the forearm are wasted, having lost about one-third of their bulk. The flexor group is still more wasted, and is hard and contracted Tact and localization normal. All the movements of the fingers normal, except extension, which is incomplete, owing to the contraction of the flexors and also to partial paralysis of their extensors. The wrist has loss of extension and of lateral movements, and the thumb has also defective extension. The patient was discharged from service October 3, 1865, and pensioned. Examiner W. Jewell reported, August 16, 1866: "Paralysis of left hand; it is entirely useless, and, at his age, irrecoverable."

A case illustrating an injury of nerve trunks owing to their being involved in a cicatrix has been detailed at page 462 of the *Second Surgical Volume*, and an example of the extension of disease along a nerve trunk to others, with consequent paralysis and atrophy appearing at points of distribution remote from the original injury, is here adduced:

CASE 1082.—Stephen Warner, Co. A, 151st New York,[1] aged 33 years, farmer, New York; enlisted August, 1862. Healthy to day of wounding. At Locust Grove, November 27, 1863, a ball entered the left chest below the first rib, half an inch below the clavicle and two and a half inches from its sternal end. Passing probably under the arch of the subclavian artery, it went backward and downward and made its exit two inches below the inferior angle of the left scapula, three and a quarter inches from the spine. The ball was fired by a skirmisher not twenty yards distant, and was received while the patient was in the act of bending forward to aim. He fell, giddy but conscious; tried to move, but failed, and fainted from loss of blood. After several hours he revived and discovered that the left arm and hand were sensitive throughout. On the radial side of the forearm there was slight numbness, a condition compatible with perfect tactile sensibility; motion appears to have been lost, or greatly lessened during some hours, and within a day to have become restored entirely. No doubt exists as to this point. No dressing was used until the third day, when water was applied. At this date the arm motions were complete below the shoulder, and there had been no pain. Soon after the cold dressing, to which he attributed the segment symptoms, he was seized with neuralgic pain, which was principally in the median nerve distribution, but also on the outside of the arm and shoulder, with a spot of intense pain at the deltoid insertion. The pain was darting and prickling in its nature. Coincidently with the pain the joints of fingers swelled and became sore, and this was especially the case with the thumb and the fore and second fingers. At the same time the shoulder muscles grew weak, flexion of the fingers grew feeble, and the flexion of the forearm was affected. All of those defects increased for several months, and the flexor group in the forearm wasted so much as to attract attention. The biceps, brachialis anticus, and coraco-brachialis were in like manner atrophied. The pectoralis major was also thus altered at a still earlier period. Up to the eighth day the patient spat blood freely. Then it ceased, and he has had no pulmonary difficulties of any kind since his admittance on February 19, 1864. *Nutrition:* Atrophy of pectoralis major great, of shoulder muscles slight, wasting of biceps and other anterior and internal arm-muscles considerable. Arm at biceps measures—left, 10 inches; right, 11¾ inches. Forearm—left, 10 inches; right, 11 inches. Left hand congested, dark, and cold. It grows cold easily. Sensation perfect. The neuralgia has nearly disappeared, except in bad weather, and about the insertion of the deltoid,

[1] Not 18th Pennsylvania Volunteers, as reported by MITCHELL, MOREHOUSE, and KEEN, *loc. cit.*, p. 64.

where there is great tenderness, and a good deal of hardening and deposit in the subcuticular tissues and over the bone. The only muscle which is hyperæsthetic to any marked degree is the biceps. The course of the musculo-cutaneous and the median nerves is acutely tender upon pressure. *Motion:* None in the pectoralis major, scarcely perceptible in the biceps, the supinator longus alone flexing the forearm. Extension of forearm perfect. The fingers act in flexion feebly, but are improving. The thumb motions are also weak but not lost. Motion is now most limited by the state of the finger joints, which, although no longer tender, are stiff and enlarged. So much improvement has taken place very recently that we cannot be sure as to what motions were lost. Probably the principal nerves of the external cord of the plexus, namely, the musculo-cutaneous and the median, were those chiefly affected; certain filaments of the posterior strand, as the circumflex, also sharing in the diseased condition. * * The case was improving when admitted, and it gained ground with increased speed under a course of baths, gymnastics, and faradization. Examiner D. Clarke, of Flint, Michigan, reported, September, 4, 1877: "Suffers most from an affection of the nerves, causing partial paralysis of the arm, and of late extending to the leg, with 'darting' pains. Pressure on the front cicatrix produces numbness, with a prickly sensation down the arm. Same effect produced by rubbing the spine." In March, 1882, the pensioner was an applicant for increase.

The immediate effects of injuries by gunshot missiles upon nerve trunks are characterized by shock, pain, and partial or complete loss of motion or sensation, the latter symptoms being peculiar and diagnostic of such lesions. The persistence and severity of these symptoms and the extent of loss of function vary within very wide limits, and seem to indicate, in some degree, the remote effects generally to be expected.

CASE 1083.—Captain Charles P. Johnson, 17th Iowa, aged 21 years, was wounded, on May 14, 1863, at Jackson, Miss., by a spherical musket ball, which entered the buttock at the left side on a level with the great trochanter, passed through the great sacro-ischiatic notch, traversed the sacrum, and made its exit on the right side through the right great sacro-ischiatic notch one inch above the right great trochanter, cutting the rectum, together with many blood-vessels, nerves, and muscles which supply the pelvis and lower extremities. At the time of the injury he was in perfect good health, weighing 200 pounds, and measuring six feet one inch in height. He fell and was carried to a house near by, where he was taken prisoner, and sent, a month later, to Atlanta. He remained a prisoner for seventeen months, until liberated by General Sherman in 1864. He was then sent to Benton Barracks, and mustered out of service in 1865. He then moved to Alton, Illinois, and finally came to Garden Grove, Iowa. During all this time he was never able to stand erect or turn upon his back or either side; but lay prone upon his face, passing his life upon a couch, from which he could never by any voluntary effort move. Assistant Surgeon John V. R. Hoff, U. S. A., who made a careful examination of the patient in February, 1876, reported: "The following tissues must have been involved to a greater or less extent, either in the wound itself or in the inflammation consequent upon it: most of the muscles arising from posterior aspect of pelvis, external and internal; several branches of external iliac artery; great sciatic nerve and numerous smaller nerves arising from it, and the sacral plexus; also some of those of the sympathetic system, and finally the rectum. I could not discover that any osseous tissue had been primarily involved. The patient remarked that small pieces of what appeared to be dead bone had occasionally been discharged while the wound was open, and from the fact that it re-opened several times it is reasonable to suppose that there was a certain amount of necrosis; but from the direction of the wound, and the fact that no history of bone trouble is given by his medical attendants, I take it that, if there was necrosis, it was due to inflammation, and not to the primary effects of the wound. For six weeks immediately following the injury the fæces were passed through both orifices of the wound, and not at all by the natural opening. After that they were evacuated both by wound and anus; then by anus alone; then from time to time, as the wound re-opened, again by wound; till finally, in 1872, the fistulæ healed entirely and spontaneously. The treatment of this case consisted solely in the administration of anodynes, tonics, and laxatives. No surgical procedure has been attempted further than to keep the wound in the most favorable condition for healing. Much of the time patient has been without professional advice, and while a prisoner often wanted for the bare necessities of life. Present condition: Mr. Johnson informs me that since being wounded his health was best two years ago, from which time it has gradually failed. The face is pale and emaciated, body shrunken till little is left but skin and bones; the muscles of the gluteal region have almost entirely disappeared, giving a peculiar flattened appearance to the buttock. The lower extremities are almost entirely devoid of motion, and, except anterior of the thighs, of sensation; they are cold to the touch, and have little muscular or adipose tissue; leg at lower third measures six inches in circumference; thigh, middle third, twelve inches; joints all stiff (doubtless from want of use). Upper extremities comparatively well developed, due to constant exercise; I judge the weight of body would not exceed seventy pounds. Patient rests alternately on breast and elbow (the body as stated being horizontal, face downward), sleeping in the former position, eating, reading, etc., in the latter. Spinal cord is very sensitive to pressure throughout its whole extent; pain is constant, referred to sacral region, and is only rendered bearable by the habitual use of anodynes. Patient is generally neuralgic. Skin pale but natural in appearance and feeling (at upper portion of the body); perspiration free, sometimes copious; pulse weak and irregular; heart action irregular, with anæmic murmur; respiration normal; tongue coated and fissured; appetite for both solids and fluids capricious; bowels constipated. This has been the case since 1867, necessitating the habitual use of laxatives (probably in a measure due to the opium habit); previous to that time, more especially while a prisoner, there was constant diarrhœa, the dejections often passing involuntarily; now, under the influence of cathartics, the movements are regular, but always accompanied by more or less pain referred to the rectum, especially when the fæces are in the least degree hard, at which time the rectum seems without expulsive power. The rectum has partially recovered its integrity, the wounds (about five inches above the anus) have closed, leaving a slight cicatricial contraction and a certain amount of torpidity, which may be an additional cause of constipation. The sphincter ani muscle is normal. Bladder is somewhat irritable, but when not allowed to become over distended is entirely under control. Other viscera than those mentioned were not examined, for the reason that any movement caused suffering. The patient has several times, with assistance, attempted to stand erect and to change his position to the back and sides; but never succeeded, and has given up all hope of ever recovering the use of his lower extremities.

He has consulted eminent surgical authority, and was advised against resorting to any operative interference, as such offered little promise of successful results." Captain Johnson died in 1879. In a subsequent report, dated December, 1879, Dr. Hoff states: "The general clinical features of this case, so far as I could ascertain, remained unchanged from date of examination up to the autumn of 1877, when, while out driving, Captain Johnson was overtaken by a severe rain storm, from the effects of which, his wife says, 'he never fully recovered.' The exact immediate condition obtaining after this exposure, I regret to say, could not be learned, as the case at that time did not fall under observation of a physician, and the attendants' descriptions were vague and general. I infer that there was no pulmonary complication; in fact, it was stated that the lungs remained remarkably healthy. The exposure to storm seemed to precipitate a condition of general asthenia; patient lost all ambition and hope, refused to take accustomed exercise (in carriage), and failed perceptibly. The circulation in lower extremities, heretofore weak, now became deficient; the limbs were benumbed, and the toes, to borrow the patient's own expression, 'seemed as though they were breaking off.' Pain was always present, and in greater degree after the exposure of 1877. From this time his appetite became more capricious, though digestion was apparently good, 'there being nothing,' his attendant said, that he could not eat at times. The bowels were constipated, the result of causes already described. Micturition frequent and painful, the quantity of secretion estimated as less than normal (no chemical examination of urine was made). There was marked change in the patient's psychical condition: memory failed, he became exacting, demanded constant attention, though not irritable, and suffered continuously from insomnia. In July, 1878, an eczematous eruption appeared on the genitals, spreading upward and downward to epigastrium and knees, covering the entire abdomen. This lesion discharged a copious and exceedingly offensive secretion, continued acutely for nine weeks, and never entirely disappeared. The greatest difficulty was experienced in treating the cutaneous lesion, on account of the necessarily prone position of the patient. A physician, Dr. Todd, was called and attempted to remove pressure by propping the patient on his side with pillows. This posture very soon became unbearable, and the patient urgently demanded to be returned to what he called his 'natural' position, which was done. The eczema, joint offspring of the general asthenia and local nervous conditions, probably excited by the difficulty of absolute cleanliness, added impetus to causes already hastening the final result. 'After the appearance of the eruption,' says Dr. Todd, 'there was a gradual though well-marked decline of powers, the digestive organs losing tone, and vomiting was not infrequent.' The wound never re-opened; there was no abscess and no observable fever. Pain in sacral region, as always, was severe, and in the latter months of life this extended to the lumbar region, causing intense suffering. Alcohol and anodynes were used extensively throughout the whole course of the case—morphia being taken to the average extent of 8½ grains per diem. No *post-mortem* examination was made."

Instances of immediate death from injuries of nerve trunks are probably rare, though it is not difficult to conceive of such disturbance of central ganglia as may induce a fatal result. The records of this office indicate the frequency with which tetanus developed itself in the early progress of wounds of nerve trunks, and how generally fatal it proved. Nervous spasms were of frequent occurrence, but were, as a rule, easily controlled.

The important labors of Mitchell, Morehouse, and Keen in the vast field presented by the organization of a hospital for diseases and injuries of nerves cannot be seen to better advantage or be better appreciated than in their clinical observations upon the remote effects of nerve injuries.[1] "Most of the cases presented phenomena which are rarely seen and which were naturally foreign to the observation even of those surgeons whose experience was the most extensive and complete. Nowhere were these cases described at length in text-books, and, except in a single untranslated French book, their treatment was passed over in silence, while even in the volume in question but a limited class of nerve lesions was discussed. In the great monographs on military surgery this defect is still so complete that wounds of nerves are there related rather as curiosities, and as matters for despair, than with any view to their full clinical study and systematic treatment."

In cases of nerve injury, immediate symptoms, when not severe, may pass away, leaving the patient uninjured, but by far the more common result is that, while there may be a temporary improvement, there is a permanency of certain symptoms, especially those of paralysis of movement and sensation. As time progresses others are added which give the case a hopeless aspect, viz: altered nutrition, changes in calorification, persistent pain, and other sensory phenomena.

On the subject of altered nutrition, Mitchell, Morehouse, and Keen (*loc. cit.*, p. 69) remark: "Atrophy of the muscles of an entire member is sure to follow complete division of its nerves when there is no subsequent repair. In this case the muscles waste alike, the areolar tissue shrinks, the vessels fade from view, and the pulse becomes feeble and

[1] MITCHELL, MOREHOUSE, and KEEN, *Gunshot Wounds and Other Injuries of Nerves*, Philadelphia, 1864, page 10.

small. The rate at which this process goes on varies greatly, but it begins very early in extreme cases, and continues until nothing is left but bone and degenerated areolar structures, covered with skin, whose altered surface tells of the singular blight which has fallen upon the member. * * * Partial atrophy is due, of course, to partial nerve lesions. The filaments which supply a group of muscles may have suffered, or only those of one or more muscles, or, finally, a part only of the nerve fibres of one muscle. In some cases the loss is equal throughout a muscle; in others it affects a lateral or longitudinal part of a muscle. Among the injuries which fail to palsy a limb at once and completely, those which bruise a nerve have seemed to us to be the most likely in the end to cause atrophies." The effects of altered nutrition upon the skin and appendages are thus described by Mitchell, Morehouse, and Keen (*loc. cit.*, p. 77): "Early in the case it is found associated in most instances with œdema of the part, and is one of the remotest effects of the loss of nervous influence. The skin becomes thickened and dry, the epithelium hangs in patches here and there and is yellow or even pale brown in tint. These peculiarities are in part owing to mere disuse; but this in no way applies to the changed form of the nails, which become curved as in tubercular disease, although to a less degree than in the other form of cutaneous affection, which is caused by partial injuries of the nerves. In fact, it may be stated as a rule, that the skin and subcuticular tissues are less strikingly altered in entire paralysis than in cases of lighter nature."

A second form of altered nutrition of the skin was not infrequently seen; it has been noticed by Paget:[1] "Glossy fingers appear to be a sign of peculiarly impaired nutrition and circulation due to injury of nerves. They are not observed in all cases of injured nerves, and I cannot tell what are the peculiar conditions of the cases in which they are found; but they are a very notable sign, and are always associated, I think, with distressing and hardly manageable pain and disability. In well-marked cases, the fingers which are affected (for this appearance may be confined to one or two of them) are usually tapering, smooth, hairless, almost void of wrinkles, glossy, pink or ruddy, or blotched as if with permanent chilblains. They are commonly also very painful, especially on motion, and pain often extends from them up the arm. In most of the cases this condition of the fingers is attended with very distinct neuralgia both in them and in the whole arm, and its relation to disturbance of the nervous condition of the part is, moreover, indicated by its occasional occurrence in cases where neuralgia continues after an attack of shingles affecting the arm. In two such cases I have seen this same condition of the fingers well marked, and only very slowly subsiding, and seeming unaffected by the ordinary treatment of neuralgia." Mitchell, Morehouse, and Keen state that out of fifty partial nerve lesions under their charge, this condition existed in nineteen, and their description of the symptoms agrees with that of Paget just given. An instance has been cited on page 1020 of the *Second Surgical Volume* (CASE 2046), and the appearance of the hand and fingers is faithfully shown in PLATE LII, opposite page 1020 of the same volume. This condition seems to have occurred in cases of injury in which there was not complete destruction of the nerve and during healing. Its duration was variable, in favorable cases disappearing after a few weeks. Pain was an invariable attendant upon these cases. Eczematous eruptions were a frequent accompaniment of this condition of the skin. In many cases of altered nutrition the hair was observed to disappear from the affected region, and a remarkable alteration in the nails was noticed, which is thus described by Mitchell, Morehouse, and Keen (*loc. cit.*, p. 81): "They

[1] PAGET, *Clinical Lecture on Some Cases of Local Paralysis*, in *Medical Times and Gazette*, London, March 26, 1864, Vol. I. p. 332.

[the nails] suffer only in the fingers the neural supply of which has been interfered with, so that the nails in the median distribution may be contorted and those in the little finger be unaffected. The alteration in the nail consists of a curve in its long axis, an extreme lateral arching, and sometimes a thickening of the cutis beneath its extremity. In other instances a change takes place which is quite peculiar, and which, to us at least, was new. The skin at that end of the nail next to the third finger joint becomes retracted, leaving the sensitive matrix partly exposed. At the same time the upper line of union of skin and nail retreats into or under the latter part, and, in place of a smooth edge, is seen through the nail as a ragged and notched border. The patient who presented these changes in the most striking form had also lateral arching of the nail, but no longitudinal curving. It was a case of the most terrible suffering, from a combination of burning pain in the hand and neuralgic pain in the forearm. * * * When the nails of the toes have been attacked, and they are very rarely so, the curving is less marked, but a distressing ulceration is apt to occur at their angles, and to break out again and again, despite of every care and attention."

Of altered nutrition of joints, Mitchell, Morehouse, and Keen (*loc. cit.*, p. 84) observe: "It consists essentially in a painful swelling of the joints, which may attack any or all of the articulations of a member. It is distinct from the early swelling due to the inflammation about the wound itself, although it may be masked by it for a time; nor is it merely a part of the general œdema which is a common consequence of wounds. It is more than these,—more important, more persistent. Once fully established, it keeps the joints stiff and sore for weeks or months. When the acute stage has departed, the tissues about the articulations become hard, and partial anchylosis results, so that in many cases the only final cause of loss of motion is due to this state of the joints. Of all the agencies which impede movement it is the most difficult to relieve."

It was found in the cases of wounded limbs that after complete division of nerves the secretions of the skin were generally absent, while incomplete division led to variable conditions of this function. In some cases there was excessive sweating, which was limited to the area of the surface affected. There were also noted cases of perverted secretion, as acid sweating and perspiration of a disgusting odor. The following cases well illustrate the condition above described:

CASE 1084.—Kilian Grim, aged about 20 years, German, enlisted August, 1861, Co. B, 121st Pennsylvania. Healthy until wounded, but exhausted and ill-fed for three days before being hurt. At Fredericksburg, December 13, 1862, a ball passed through the lower third of the thigh, entering externally four inches above the upper border of the patella, and emerging two inches lower on the inside. It went behind the bone, entered the right leg below and behind the knee, and, traversing the calf obliquely downward, made its exit on the other side. In the right leg no large nerves were injured. In the left the sciatic must have been slightly affected. He was able to walk several miles with his limbs thus wounded. The chief difficulties in his case, when we examined him in July, 1863, were severe burning on top of the left foot, congestion and eczema, without marked redness or thinning of the skin, but accompanied with ulceration on the edges of the nails. This existed also in the great toe of the right foot, which had defective sensibility. He had complete paralysis of all the flexors of the foot, partial of the *flex. com. dig. pedis* and of the calf muscles. He could walk, but dragged the foot, or else carried it in a long sling. All of these muscles improved under treatment; the burning grew better, and the eczema left his foot, but the ulcers proved unmanageable. After five months' treatment he was discharged, with more or less volitional control over all the muscles affected. At no time had he any marked atrophy.

CASE 1085.—Admitted about the same time as the last was another instance of ball wound close to the sciatic nerve. Here also was burning on top of foot. Defective sensation of touch on the outside of the foot and the leg, in the sole and the toes, and part of the instep. Loss of power in the flexors of the foot complete. Eczema coming in crops about every two weeks as high up as to the knee, and with relief to the burning. Foot swelled when dependent, and this increased the pain to an unbearable degree. Nearly total relief of all the symptoms in five months, when he was transferred to the West. Cessation of the electricity at this time. Partial relapse as to movement. No further history.

CASE 1086.—Austin Lawton, machinist, aged 20 years, enlisted April, 1861, Co. A, 4th Ohio. Wounded at Chancellorsville, May 3, 1863, by a piece of shell, which fell on the inside of the arm just below the axilla. The skin was torn slightly and the parts severely bruised. His fingers clutched the ramrod, which he was using, and required force to unlock the grip. Pain

in the hand, of a burning character, came on, he says, within a few minutes, and has remained ever since. So severe was it that he was in bed on account of the pain alone for nine weeks. The hand is now kept in a sling and constantly covered with wet cloths. Sensation impaired in the back of the forefinger and thumb and in the radial half of the palm. The flexor profundus digitorum and the flexor *subl. dig.* were both very feeble, but they soon regained power when faradized, during a few weeks. It was then perceived that the real difficulty lay in the stiffened and painful state of the joints at the second and third digital articulations. Passive motion and the usual treatment of the burning were ordered, with almost total return of normal movement, but without any ease to the burning. After two months he preferred to return to his regiment for light duty as orderly to the colonel.

Besides illustrating the phenomenon of excessive skin secretion, the following case presents with unusual clearness the group of symptoms which may attend lesions of nerve trunks; in many cases one or two of these symptoms may predominate; but here they all seem to be strongly marked, as pain and burning hyperæsthesia of the skin, partial paralysis of sensation and motion, excessive skin secretion and commencing impairment of nutrition. In addition reflex action is well shown.

CASE 1087.—Private William A. Sturdy, Co. I, 18th Massachusetts, aged 22 years, was wounded at Bull Run, August 30, 1862, receiving an injury of the right arm. He was admitted, on September 2d, into Camden Street Hospital, Baltimore, and on September 19th was transferred to West's Buildings Hospital. Here he remained until April 29, 1863, suffering from neuralgia. He was afterwards treated in Lovell Hospital, Portsmouth Grove, and on May 23, 1863, was admitted into Central Park Hospital, New York. Acting Assistant Surgeon M. G. Echeverrio reported: "The ball entered the posterior and superior part of the outer face of the right arm and came out through the union of the two inferior with the superior thirds of the inner border of the biceps brachialis. There was scarcely any inflammation of the wound upon its infliction; the arm became numb, and the first night after he was wounded he had severe pain in the hand which has continued ever since, existing principally in the thumb, index and middle fingers. Sensibility has been impaired in the forearm and hand. Electricity was applied in the beginning for a period of three or four weeks, with very little success. August 16, 1863: There is now hyperæsthesia, and the skin of the hand is constantly wet with perspiration. Pressure of the wound produces a burning pain in the three fingers affected; their movement is likewise very much impeded and the nutrition of their muscles has been diminished; they exhibit a beginning of atrophy. The temperature of the hand is not different from that of the other hand, nor does the pulse in the right forearm exhibit any marked difference to that of the left. The touch of a rough surface with the left hand produces, by reflex action, a more or less severe pain in the paralyzed fingers of the right hand. This phenomenon may be repeated several times, and when discontinued a great deal of the left hand is wet. An ointment composed of four grains each of aconitine and atropine to an ounce of cerate has brought about great relief of the neuralgic pain, but the paralytic condition of the fingers remains always the same." This soldier was discharged from service August 16, 1863, for "neuralgia of right hand, the result of gunshot injury," and pensioned. Examiner J. B. Chase, of Taunton, Massachusetts, reported, May 16, 1877: "The bullet struck the right arm near the junction of the upper and middle thirds of the humerus, on the outer and posterior surface of the arm (it being raised at the time), and passed directly through on the inner side of the humerus without injuring the bone, and emerged near the head of the biceps muscle, injuring the brachial nerve. The circumference of the right arm is 10½ inches, of the left arm 11 inches; of the right forearm 10 inches, of the left 10½ inches. The radial nerve is partially paralyzed. The muscles of the right thumb, particularly the abductor, are very much smaller than those of the left, and the forefinger is smaller than the left. He cannot fully rotate the forearm nor fully extend the elbow. He says his right forefinger and thumb are very weak, and alleges pain in the thumb, index, and side of middle finger next the index, and that they are cold. Pressure at place of exit of bullet causes pain along the course of the radial nerve."

Lesions of sensation were always present in some degree. Hyperæsthesia and anæsthesia were commonly observed. The following case shows how sensation may be preserved while motion is largely impaired:

CASE 1088.—Corporal B. Graham, aged 22 years, enlisted September, 1861, Massachusetts Artillery, 5th Battery. Previously healthy. On May 12, 1864, he was struck on the back and outside of the right arm by a piece of shell which denuded but did not break the humerus. The wound lay immediately below the deltoid insertion, and was five inches wide as it stretched across the arm, and three inches in diameter from above downward. The arm dropped and he had sharp pain in the wound, so that he cried aloud. The after pain was trifling. As he went to the rear he examined the limb and found that he could move his fingers a little, but that there was no notable loss of feeling. The wound healed rapidly, and is now, June 10, 1864, level with the skin. Nutrition is unimpaired. The right forearm measures 9⅝ inches, the left 9½ inches. Outside of the elbow, for a short space, tactility is enfeebled. In the radial distribution touch is slightly less perfect than usual; elsewhere there is no lesion of sensation. The supinator longus muscle, supplied by the musculo-spiral, acts pretty well. The extensors of the wrist and thumb and the extensor communis are completely paralyzed. The interossei act well. The triceps extensor is healthy. The muscles above named as paralyzed have no electric contractility, the currents applied to them always causing contraction of the flexor group. He was discharged September 14, 1864.

Neuralgia was of great frequency and of great persistence, stubbornly resisting treatment. Its favorite seat seems to have been the hand and foot; other parts of the body were rarely attacked. Severe neuralgia was in some instances due to the presence of

foreign bodies, such as fragments of lead from a bullet, splinters of wood, iron, or bone pressing upon or embedded in a nerve trunk; the pain resulting from such causes were always more acute and persistent. "The intensity of neuralgia varies from the most trivial burning to a state of torture which can hardly be credited, but which reacts on the whole economy, until the general health is seriously affected." (Mitchell, Morehouse, and Keen, *op. cit.*, p. 102.) The temperature of affected parts was found to be higher than that of surrounding or corresponding portions of the body. The following case illustrates this painful condition:

CASE 1089.—J. H. Corliss, late private, Co. B, 14th N. Y. S. M., aged 27 years, shingle dresser, enlisted April, 1861, in good health. At the second Bull Run battle, August 29, 1862, he was shot in the left arm three inches directly above the internal condyle. The ball emerged one and a quarter inches higher, through the belly of the biceps, without touching the artery, but with injury to the median and ulnar nerves. He was ramming a cartridge when hit, and "thought he was struck on the crazy-bone by some of the boys for a joke." The fingers of both hands flexed and grasped the ramrod and gun tightly. Bringing the right hand, still clutching the ramrod, to the left elbow, he felt the blood and knew he was wounded. He then shook the ramrod from his grasp with a strong effort, and unloosened with the freed hand the tight grip of the left hand on the gun. After walking some twenty paces he fell from loss of blood, but, still conscious, attempted to walk several times and as often failed. He was finally helped to the rear, taken prisoner, lay three days on the field without food, but with enough water to drink, and had his wounds dressed for the first time on the fourth day, at Fairfax Court House. On the second day the pain began. It was burning and darting. He states that at this time sensation was lost or lessened in the limb, and that paralysis of motion came on in the hand and forearm. His statement is unsatisfactory and indistinct. Admitted to the Douglas Hospital, Washington, D. C., September 7, 1862. The pain was so severe that a touch anywhere, or shaking the bed, or a heavy step, caused it to increase. The suffering was in the median and ulnar distribution, especially at the palmar face of the knuckles and the ball of the thumb. Motion has varied little since the wound, and as to sensation he is not clear. Peter Pineo, Surgeon, U. S. V., now Medical Inspector U. S. A., exsected two or three inches of the median nerve at the wound. (See Army Medical Museum *Specimen* No. 959.) The man states, very positively, that the pain in the median distribution did not cease nor immediately lessen, but that he became more sensitive, so that even the rattling of a paper caused extreme suffering. He "thinks he was not himself" for a day or two after the operation. It seems quite certain that the pain afterward gradually grew better, both in the ulnar and median tracts. Meanwhile the hand lay over his chest, and the fingers, flexing, became stiff in this position. About a week after he was shot the right arm grew weak, and finally so feeble that he could not feed himself. He can now, April, 1864, use it pretty well, but it is manifestly less strong than the other. The left leg also was weakened, but when this began he cannot tell. He gives the usual account of the pain, and of the use of water on the hands and in his boots, as a means of easing it. Present condition, April, 1864: Wound healed; cicatrix of the operation two and a half inches long over median nerve. The forearm muscles do not seem to be greatly wasted. The interosseal muscles and hypothenar group are much atrophied, and the hand is thin and bony. The thenar muscles are partially wasted. The skin of the palm is eczematous, thin, red, and shining. The second and third phalanges of the fingers are flexed and stiff; the first is extended. Nails extraordinarily curved, laterally and longitudinally, except that of the thumb. Pain is stated to exist still in the median distribution, but much less than in the ulnar tract, where it is excessively great. He keeps his hand wrapped in rags wetted with cold water and covered with oiled silk, and even tucks the rag carefully under the flexed finger-tips. Moisture is more essential than cold. Friction outside of the clothes, at any point of the entire surface, "shoots" into the hand, increasing the burning in the median sometimes, and more commonly in the ulnar distribution. Deep pressure on the muscles has a like effect, and he will allow no one to touch his skin with a dry hand, and even then is careful to exact a tender manipulation. He keeps a bottle of water about him and carries a wet sponge in the right hand. This hand he wets always before he handles anything; used dry, it hurts the other limb. At one time, when the suffering was severe, he poured water into his boots, he says, to lessen the pain which dry touch or friction causes in the injured hand. So cautious was he about exposing the sore hand that it was impossible thoroughly to examine it; but it was clear to us that there was sensibility to touch in the ultimate median distribution, although he describes sensation as somewhat lessened in this region, and states that he has numbness on the inner side of the palm and in the third and fourth fingers (ulnar tract). When the balls of the first and second fingers were touched he said he felt it; but, on touching those of the third and fourth fingers, he refused to permit us to experiment further, and insisted on wrapping up and wetting the hand. He thus describes the pain at its height: "It is as if a rough bar of iron were thrust to and fro through the knuckles, a red-hot iron placed at the junction of the palm and thenar eminence, with a heavy weight on it, and the skin was being rasped off his finger ends." (Mitchell, Morehouse, and Keen, *loc. cit.*, p. 109.) The following information was received from Douglas Hospital, under charge of Surgeon Peter Pineo, U. S. Vols.: "The ball passed through the inner and anterior part of the arm at the junction of the middle and upper thirds, apparently involving the median nerve. He entered this hospital September 1, 1862, suffering excruciating neuralgia of the palmar portion of the hand and fingers. The wound healed kindly, but the pain in the hand continued in its intensity, yielding to no treatment, though nervous remedies, both local and constitutional, were resorted to. The extreme suffering produced an exalted sensibility of the entire nervous system which manifested itself in an extraordinary excitability of the patient, he complaining bitterly at the least jar or noise in the ward. This sad condition increased in severity until December 9, 1862, when the operation of resection of the median nerve was performed by Dr. Peter Pineo, in charge of the hospital. The patient being etherized, about two inches of the nerve was removed and the wound closed by adhesive strips. After the effect of the ether passed off the patient still complained of much pain in the hand, but seemed to think it was not so intense as before the operation. The patient's appetite continued good through all this suffering, and he was allowed a liberal diet. For several days after the operation the patient was allowed sulphate of

morphia;. but it was soon entirely withdrawn. The wound healed by first intention, but there seemed to be no positive improvement in regard to the neuralgia until December 14th, five days after the operation, when he was moved to a separate room; after which the hyperæsthesia seemed perceptibly to subside. February 14, 1863, the patient was discharged from the service at his own earnest solicitation. At this time he was able to walk about the room at night, but still suffered very much from the slightest excitement." Examiner J. T. Burdick, of Brooklyn, reported, October 23, 1866: "A ball perforated the arm three and a half inches above the condyles, injuring the median and ulnar nerve trunks. He alleges that two inches of the median nerve were excised by the surgeon; the existence of a longitudinal eschar three inches in length tends to confirm the statement. The fingers are rigidly flexed into the palm. The arm and hand are atrophied. In my opinion the disability is equal to the loss of the arm." The Brooklyn Examining Board, Drs. McCollom and Leighton, reported, September 18, 1873: "Contraction of thumb and fingers into palm of hand. Extreme sensitiveness of the fingers. Arm and hand useless."

Paralysis of motor nerves from gunshot injury was found to vary in all degrees of severity and completeness, resulting from blows, wounds, concussions, and from transferred irritation. In the following instance a slug remained in the left shoulder for twenty years, when it was accidentally disturbed in its resting place by a fall of the patient. Paralysis of the left arm and left leg ensued, but was completely relieved by the removal of the slug:

CASE 1090.—Sergeant C. A. Norton, 1st Maine Cavalry, aged 22 years, while out with a scouting party was wounded, August 7, 1862, by a rebel hid in a cellar, by three leaden slugs, one striking the right hip, another the right arm, and the third lodging in the left shoulder. The wounds in the hip and arm were slight and occasioned but little pain and healed in twenty days; the wound in the left breast and shoulder was deep and produced peculiar sensation. The slug entered just over the third left rib about on a line with the middle of the clavicle, and passed upward and backward, lodging in the deep muscles. When hit the patient instantly fell forward but did not become unconscious, although it was some moments before he could speak. The mind was unusually active and incidents of his childhood, long forgotten, passed rapidly in review. The pain at first was of a sharp tingling kind, accompanied by a beating, throbbing sound in the left ear, and the eyes became very sensitive to the sunlight. All these symptoms gradually disappeared, and in two months he rejoined his command. In about a year his eyesight had so failed that he was compelled to use positive glasses, and he also had frequent attacks of neuralgia of the heart. These conditions remained unchanged for twenty years; the wound in the shoulder occasioned no further inconvenience until May, 1882. But he could at any time, by simply striking the heel of the left foot smartly on the ground, produce a numb feeling on the left side of the body, including the arm and head. In May, 1882, he fell down a flight of steep stairs, striking the left shoulder in the fall. At first he had a faint deathly feeling at the stomach, and a sharp smarting pain in the left hand and arm and down the spine. These symptoms gradually wore off, and the next morning he only felt a slight soreness from the bruise. About noon the day after the fall, while writing, he found he had suddenly lost the power to move the fingers of the left hand, and in a moment the arm became useless. He was writing at the time with the left hand, having lost the right arm at Fort Fisher in 1865. He could not rise from his chair, for the left leg was also powerless. He was at once removed to his home, where it was found that he had paralysis of the whole left side, with complete loss of sensation, not being able to feel the deep prick of a pin. The eyes were very sensitive to the light, and the voice was weak and tremulus. In four days he so far recovered as to be able to walk, but the arm and hand remained almost useless. Feeling that the slug in the left shoulder was the cause of this trouble, he had it removed in June, 1882, twenty years after receiving the wound. It was about as large as a common lead pencil, three quarters of an inch long, flattened at both ends, and weighed at the time of removal 120 grains. After the removal of the slug the numbness and coldness gradually disappeared from the hand and arm, and in three weeks he could hold a pen and write a few moments at a time, and in six weeks, with the exception of a slight weakness, the hand and arm were as well as ever. The eyesight, which for nineteen years had compelled the use of glasses, improved so much that the glasses were not needed or used, and the neuralgia of the heart, of which he had so long suffered, had not made its appearance in September.

In the work of Drs. Mitchell, Morehouse, and Keen, so freely quoted, the diagnosis and prognosis of this class of injuries are succinctly stated (*op. cit.*, p. 120): "The diagnosis of this paralysis is of course easy. A ball cuts a nerve, or, as is more common, stuns or contuses it, and we have certain muscles made powerless. In a few days, if the nerve injury has been partial, some of these muscles improve or recover entirely. In other cases, weeks or months go by without change for the better, and the muscles fall victims to atrophy and contraction." As to prognosis: "Of course every case of partial loss of function is more likely to recover than one of total loss, and if the will has any control over the muscle after the injury we may reasonably look for an increasing gain. But there are varieties of muscular injury outside of the mere palsy of volitional control. Early loss of tone in the muscle is a bad sign; rapid shrinking in size is another; and contraction, when this is a nutrient change and not pure spasm, is worse still. They are all due to lesions of nutritive fibres, and are ominous of ultimate deformities and of permanent loss of power. But these signs, already fully discussed, arrive late in the case. It is possible, at a very early date,

usually within two weeks of the injury, to make a very complete prognosis, by means of electricity, as to the extent of the motor palsy and the probability of its remaining intractable to treatment or not."

As results of motor paralysis are found loss of motion from alterations of joints, contracted muscles, spasmodic affections and tremors. The following cases show the condition and phases of injuries affecting motor nerves:

CASE 1091.—Private Patrick H. Mahoney, Co. H, 13th Iowa, aged 38 years, was wounded at Shiloh, April 6, 1862. On May 7th he was admitted into the hospital at Quincy, Illinois. Surgeon R. Niccolls, U. S. Vols., reported: "Wounded in the left arm; the ball entered near the insertion of the pectoralis major, traversed the axilla, and came out at the lower angle of the scapula, evidently dividing some of the branches of the axillary plexus. Ever since admission he has complained of violent neuralgia of the wounded arm, and especially of the hand, together with exalted sensibility of the whole surface, so that he starts and complains of pain when touched anywhere. His face is flushed. Narcotics seem to make but little impression upon him. September 3d: Neuralgia now confined to the hand. Flush and sensibility of surface nearly gone. Bowels regular; sleeps well. Pulse 112, full and strong. Muscles of forearm somewhat atrophied, of hand completely so. Flexors and extensors of fingers contracted so as to bend the fingers like the letter S. Skin of hand bright red, partially from the constant use of water dressings. Has very little motion of the fingers. The galvanic battery was tried at one time, without effect. September 15th: The pains appearing to be somewhat periodical, a mixture containing quinine 30 grains, tincture of aconite 40 drops, strychnia ¼ grain, aromatic sulphuric acid q. s., and water 4 ounces, was given in tablespoonful doses every six hours. This prescription seemed to aggravate his pain and was discontinued on the 17th." Mahoney was discharged September 22, 1862, and pensioned. Examiner W. H. Walker, of Fond du Lac, Wisconsin, reported, March 15, 1867: "He was wounded through the upper third of the left arm, injuring the axillary nerve and artery. Hand and arm atrophied and entirely useless for practical purposes. He can use the hand as a dead weight to hold a paper when writing. Cannot hold his fork to cut his meat. Cannot take his hat off with the hand; it is absolutely useless for manual labor." He was paid December 4, 1876.

CASE 1092.—J. S. L. Scott, aged 31 years, farmer, New York, enlisted August, 1862, Co. F, 121st New York. Wounded May 3, 1863, at Chancellorsville. The ball entered the right leg a little below its middle, in front of the fibula three-fourths of an inch, and emerged one inch and a fourth behind the tibia, on the same level, without injury to the bones. Total loss of motion below knee; slight of sensation. Pain only on the second day, from inflammation. The after history doubtful, except that sensation improved. Present condition, September 12, 1863: The patient walks with a crutch, the foot being suspended in a long sling, in extension, and quite useless. Attempts at flexion resisted by the pinning of the cicatrix and by shortening of the soleus chiefly. (See *Specimen* No. 6682, in the Army Medical Museum, a cast of the foot and ankle.) Sensation impaired slightly in the foot, but nowhere lost. The leg and thigh muscles slightly tender on pressure. The foot feels warm, the toes are cold and purple. No burning. *Treatment:* Alternate cold and hot douches; splint to correct malposition; faradization daily. October 26, 1863, re-examined: Tactility and localization nearly perfect; cold and heat are appreciated correctly, although slowly; sensibility to pain much impaired below the knee, but lost at the outer head of the gastrocnemius and on the outside of the foot; volitional control lost from the knee downward; electric contractility feeble in the tibialis anticus, extensor longus digitorum com., and extensor proprius pollicis; it is best, though weak, in the peroneus longus. In none of these, nor elsewhere, are the contractions sufficient to stir the parts. None of the calf muscles respond at all, and electro-muscular sensibility is absent in all except at the upper end of the external origin of the gastrocnemius. Withal, there is no atrophy. The electric brush gives little or no pain on the dried skin. The muscles, or, at all events, the subcuticular tissues, are sore when firmly pressed, especially the great toe and the inside of the plantar arch. It is difficult to reconcile this with the analgesia so evident where a needle is used. It is remarkable, but in accordance with M. Duchenne's experience, that above the wound the muscles in general have lost electric contractility as well as below it. December 20, 1863: The anterior muscles have regained sensibility to electricity. A club-foot apparatus was used to flex the foot. January 1, 1864: Contractility under electricity returning in anterior muscles and calf. No voluntary power. January 20, 1864: Calf muscles begin to respond to will. Electro-muscular contractility well marked in tibialis anticus, peroneus longus, common extensor, and interossei. Volition good as to calf muscles; none as to anterior group; but the foot is now flexed to over a right angle, and when it is cased in a stout gaiter he can walk well with a cane; for, although he has no volitional flexion, the weight of the body on the toes and ball of the foot serves to antagonize the calf. The man is anxious to be discharged, although, from the return of electric properties in the tibial group, we feel sure of ultimate cure with the aid of electricity. Under the circumstances we do not feel that it is proper to retain him. Discharged February 12, 1864, and pensioned. Pension Examiner Lanning reported, February 4, 1874, that paralysis of the foot and toes was nearly complete. The pensioner's condition was unchanged in 1876.

Carefully conducted experiments on the condition of calorification in injuries of the nerves were made by Drs. Mitchell, Morehouse, and Keen. The results in a number of grave cases are summed up as follows (*op. cit.*, p. 135): "It was observed that the member the nerves of which were affected was nearly always colder than the other, whether the nerve lesion was extensive or trifling. In two cases there was no difference. One of these was an instance of total motor palsy below the knee, with good tactile feeling preserved and without atrophies. The other was a wound of the portio dura of the seventh nerve; the motor palsy complete, sensation perfect. Five cases had a higher temperature in the

wounded limb than in the sound member. Of these, one was an ordinary nerve wound, with slight loss of sensation and with a good deal of motor paralysis. All of the others were cases of the burning pain so often alluded to. The examination in these was limited to the spot affected. At the time of these observations we had no wounds in which complete division of all the nerves of a part had occurred; and in fact this is a rare accident. The sole exceptions were wounds of the seventh pair. One of these we examined as to temperature, but with no notable result. There was no difference between the two sides."

EFFECTS OF MISSILES AND PROJECTILES ON BLOOD-VESSELS.—Wounds of blood-vessels, the effect of missiles and projectiles, were few in comparison with the total number of shot wounds recorded during the war.

In the general consideration of these injuries the question as to the particular character of the missile does not appear to assume much practical importance; in fact, it is difficult to distinguish the effects of injuries inflicted by one or the other form of more common forms of bullets.

It is probable, from the general nature and conditions pertaining to missiles, that a round ball will more frequently contuse than divide a blood-vessel, while the contrary may be expected to result from an injury by a conoidal bullet; but perforations by round balls have also been noted, as in the following case:

CASE 1093.—Private Henry Owens, Battery A, 5th U. S. Artillery, aged 23 years, was wounded at Suffolk, Virginia, April 15, 1863, by the bursting of a shell over his head. Surgeon T. H. Squire, 89th New York, reported: "A flesh wound, a mere graze across the right ramus of the lower jaw, near the chin; a second wound, penetrating, a slit three-fourths of an inch across the side of the neck, over the middle of the sterno-cleido-mastoid muscle, the opening being near three inches from the median line in front. April 18, 1863, the right side of the neck, extending down toward the subclavicular region, is swelled and somewhat emphysematous to the touch. There is some pain in the chest in the region of the mediastinum; some dyspnœa and cough, and a little spitting of blood on one occasion. Respiratory murmur very distinct, and percussion resonant over the front of both lungs. He died on April 19, 1863. *Post-mortem* examination at 1 o'clock P. M. on April 19th: Countenance livid; mottled appearance of skin on the right shoulder, arm, and chest; frothing at the lips; all of the right chest, save a hand's breadth immediately beneath the clavicle, dull on percussion; left chest resonant on percussion in front. Made one incision through the skin and areolar tissue from the point of the thyroid cartilage down to the umbilicus; one from the point of commencement, about four inches long, just below the ramus of the under jaw; and a third at right angles with the first, from the umbilicus, about six inches to the right. Dissected back this whole flap, including skin, superficial fascia, and platysma myoides. Areolar tissue of the whole right side of the neck injected with dark blood. Discovered the opening caused by the missile to be nearly in the centre of the sterno-cleido-mastoid muscle; the omo-hyoid muscle was also injured by the ball. Sterno-hyoid and sterno-thyroid uninjured, being toward the median line from the wound. Thyroid gland quite large. Arrived at this point, discovered that the ball had passed through the *internal jugular* vein about two inches above the clavicle, the wounds of entrance and exit being on the anterior and posterior walls of the vein, the outer and inner third being entire. The vessel from this wound, upwards in the neck, was occupied with a large clot of blood; par vagum and carotid uninjured; scalenus anticus perforated, the direction of the ball being downward and toward the spine. On opening the chest a great deal of serum escaped from the right pleural cavity. There was extensive adhesions of recent false membrane over the whole of the right lung, or the greater portion of it. The ball, after going through all the soft parts, as narrated, struck and fractured the neck of the first rib, also the neck of the second rib, and finally found a lodgement by the right side of the body of the third dorsal vertebra, in the posterior mediastinum. From the right cavity of the chest, after the lungs were removed, the ball could easily be felt with the fingers, lying in the place where its motion was arrested, with nothing but the costal or mediastinal pleura intervening between it and the cavity of the chest. The ball evidently bruised the mediastinal pleura, injured it, but did not make an opening in it. The lung was not inflamed. The ball was round, the size of a common musket ball, and battered on one side. It may be well enough to remark that there was never any bleeding to speak of in this case. By a further and more careful examination of the injury to the vein I find that the ball actually perforated the vessel instead of biting out a piece on one side." The wounded portion of the right internal jugular vein was forwarded to the Army Medical Museum by Dr. Squire, and is numbered *Specimen* 1055 of the *Surgical Section*. A part of the parietes of the vein is carried away, and in the posterior portion an orifice is seen, through which the contributor considers the missile passed.

Distorted balls, pieces of shell, fragments of stone and iron, and splinters follow the general rule common to all missiles, by contusing, cutting, and puncturing blood-vessels.

The graver lesions due to the impact of large projectiles are so manifest in their character as to need no comment.

The position of the larger trunks of the principal blood-vessels tends to give them

immunity from accident. They are deeply placed, sheltered by the bony frame-work, protected by soft parts and by fasciæ capable of deflecting the course of a missile; their investing sheaths and coats are strong and tough; having a certain degree of freedom of motion they are enabled to slip aside and elude a passing missile; their tubular form and easily compressed fluid contents are also elements of safety. All of these conditions may have their influence in contributing to the many fortunate escapes from severe, perhaps fatal, injury common to the experience of every military surgeon.

CASE 1094.—Private Michael Hussey, Co. D, 37th New York, aged 32 years, was wounded, while on picket, at Occoquan, Virginia, February 24, 1862. Surgeon W. O'Meagher, 37th New York, reported:[1] "The ball entered the right thigh near the lower angle of Scarpa's space, eluded or pushed aside the femoral vessels, passed upward, and escaped posteriorly in the gluteal furrow. Very little hæmorrhage occurred, though he walked a considerable distance back to the picket station. A plug of scraped lint was inserted into each opening and a roller bandage applied, this being kept wet with an evaporating lotion. Next day he was removed to the regimental hospital, and for two weeks following little more was done except to apply a poultice. By this time he was able to walk about, no bad symptom having occurred to mar his speedy convalescence." On March 5, 1862, he was transferred to the Mansion House Hospital, Alexandria, whence he was returned to duty August 7, 1862. He continued in service until June 8, 1865, receiving at Petersburg, on May 9, 1864, a shot wound of the forehead. In February, 1882, Hussey was an applicant for pension.

In the case of Private William McDonald (*First Surgical Volume*, page 397), Co. F, 51st New York, a musket ball lodged between the carotid artery and the jugular vein, pressing the vein forward to such an extent that the vessel was collapsed and little or no blood passed through it. In the case of Captain J. N. Lake (*First Surgical Volume*, page 412), a musket ball passed on a level with the pomum Adami, between the jugular vein and the carotid artery, without injuring either vessel.

Aside from the injuries of large trunks which are immediately fatal, it would appear that the number of cases of wounds of important blood-vessels is small. In the preliminary report (*Circular* No. 6, *Surgeon General's Office*, 1865, page 38) it was stated that "in the campaign of the Army of the Potomac from the Rapidan to the James, in May, June, and July, 1864, of a total of 36,508 gunshot wounds only 27 belonged to this category." Dr. Longmore[2] says: "Out of 4,434 wounds detailed in the British returns of the Crimean War, only 15 wounds of arteries were registered." Surgeon M. Goldsmith, U. S. V., "desiring to learn whether external primary hæmorrhage often occurs as the instant result of shot wounds," placed himself "near the line of battle, and observed only one case, a soldier struck in the neck, severing the carotid," and fatal before he could reach him.

In the following case the common carotid artery was perforated from before backward; death ensued very rapidly:

CASE 1095.—Lieutenant Colonel E. A. Kimball, 9th New York, aged about 40 years, of well-knit frame and in good health, was shot at Suffolk, Virginia, at about 4 o'clock A. M. on April 12, 1863. Surgeon T. H. Squire, 89th New York, reported: "It is said that Lieut. Colonel Kimball uttered a brief ejaculation after he was shot and died almost instantly. A pistol was the arm used; the person firing was on horseback, the person shot standing on the ground very near him. I examined the body at 3 o'clock P. M. Blood was dried on the clothes on the front of his person from the throat to the boots. An opening half an inch in diameter existed in the front of the neck, the edge of it only about a quarter of an inch to the right of the median line, and the centre of the opening being about three-quarters of an inch below the prominent point of the thyroid cartilage. No other opening existed; but the ball was felt beneath the skin just over the posterior border of the scapula. Here I made an incision and removed it with forceps. Putting my finger in the opening I found that the ball had just made a notch in the border of the blade at the point corresponding to the termination of the spine of the scapula. From the point of entrance the ball took its course downward and backward, but nearly in a direct antero-posterior direction. I made one incision in the medium line from the thyroid cartilage to the top of the sternum, another from the point of commencement toward the angle of the jaw about two and a half inches, and a third from the bottom of the first in the direction of the clavicle about two inches. 1st, Laid back the skin and superficial fascia; 2d, the platysma myoides muscle (the areolar tissue was dark with suffused blood near the wound); 3d, divided the lower attachment of the sterno-cleido-mastoid and carried the muscle up and laid it on the reflected skin; the ball went just to the inner edge of this muscle; 4th, divided the omo-hyoid and turned it away; 5th, cut the upper attachment of the

[1] O'MEAGHER (W.), *Cases in Military Surgery; Gunshot Wound of Thigh, narrow escape of Femoral Vessels*, in *American Medical Times*, 1862, Vol. IV, p. 205.

[2] LONGMORE (T.), *Gunshot Injuries*, etc., London, 1877, page 150.

sterno-hyoid and turned it down (the ball hole was right through the middle of the muscle), and also cut the lower attachment and then the muscle away; 6th, did the same thing with the sterno-thyroid; 7th, discovered that the ball had made a notch in the edge of the thyroid gland; 8th, cleared away areolar tissue dark with suffused blood; 9th, found the *common carotid artery absolutely perforated* from before backward, there being a roundish opening in the anterior and a somewhat longitudinal one in the posterior wall, the two lateral portions of the tube being entire; 10th, the par vagum and the vein uninjured; 11th, this ball hole in the carotid was used, without any alteration, to insert the syringe pipe to inject arsenic to preserve the body; 12th, the ball was conical and quite a size larger in diameter than the diameter of the artery."

The passage of a missile through any part of the body will necessarily divide and lacerate many small blood-vessels, but serious results seldom follow, as permanent retraction of the injured vessels takes place at once.

When an artery of size is completely divided by the impact of a large or small projectile at high velocity there may be a gush of blood; but the immediate retraction of the inner and middle coats and the formation of a coagulum will generally prevent further hæmorrhage and secure the patient for the time at least.

In eighty-four of one hundred and eighteen cases of complete division of the larger arteries no primary bleeding was observed, while in thirty-four cases, or 28.8 per cent., the injury was followed by primary hæmorrhage.

TABLE CXXIII.

Summary of One Hundred and Eighteen Cases of Complete Division of the larger Blood-vessels, indicating the number of cases in which primary bleeding occurred.

ARTERIES.	CASES.	RESULTS.		PRIMARY BLEEDINGS.		NO PRIMARY BLEEDING.	
		Recoveries.	Fatal.	Recoveries.	Fatal.	Recoveries.	Fatal.
Complete division of Common Carotid	2	.....	2	.....	1	.....	1
Complete division of Internal Carotid	1	.....	1	.....	.....	.....	1
Complete division of Axillary	6	.....	6	.....	1	.....	5
Complete division of Brachial	15	10	5	3	2	7	3
Complete division of Radial	10	6	4	3	.....	3	4
Complete division of Ulnar	6	4	2	1	.....	3	2
Complete division of Femoral	31	5	26	1	13	4	13
Complete division of Popliteal	20	6	14	3	2	3	12
Complete division of Tibials	24	6	18	.....	3	6	15
Complete division of Peroneal	3	1	2	.....	1	1	1
Aggregates	118	38	80	11	23	27	57

The proportion of primary bleedings to the number of cases in which the blood-vessels were completely divided is rather larger than that observed by Dr. Lidell,[1] who found that in twenty cases the bleeding ceased spontaneously in all but three.

In the following case, in which the posterior tibial was severed, hæmorrhage did not occur until thirteen days after the injury:

CASE 1096.—Sergeant Z. H. Mather, Co. M, 5th Michigan Cavalry, aged 27 years, was wounded near Funkstown, July 8, 1863. He was treated in a field hospital, and was admitted on July 17th to hospital No. 1, Frederick, Maryland. Acting

[1] Dr. JOHN A. LIDELL (*Surgical Memoirs of the War of the Rebellion, collected and published by the United States Sanitary Commission*, Surgical Volume I, p. 26), in commenting upon twenty cases in which important arteries were completely divided, says: "In all but three of these twenty cases the primary bleeding ceased spontaneously. . . Of the twenty cases wherein the wounded vessel was completely divided by the bullet, the femoral artery was the seat of the injury in five instances, of which all died; the popliteal in four instances, of which two died and two recovered; the posterior tibial in two instances, of which both died; the axillary in four instances, of which two died and two recovered; the brachial also in three instances, of which one died and two recovered; the internal mammary in one instance, which proved fatal; and the external carotid in one instance, which recovered. Of the thirteen fatal cases in which the artery was severed, two died of primary hæmorrhage, two of secondary hæmorrhage, five of gangrene, one of gangrene and secondary hæmorrhage, one of pyæmia, and two of exhaustion. . . The analysis of these twenty cases shows that gunshot wounds dividing large arteries are not only very dangerous to life, but that they occasion death in certain determinate ways, the most important of which are primary hæmorrhage, secondary hæmorrhage, and consecutive gangrene."

Assistant Surgeon W. S. Adams reported: "Wounded by a minié ball, which entered the outer and lower border of the popliteal space, passed inward and downward, and lodged beneath the skin on the opposite side, from which point it was cut out upon the field. Patient's condition fair, and wounds present a healthy appearance. Ordered full diet. July 21st, 6 P. M., hæmorrhage has just taken place from the wound of entrance to the extent of about eight ounces. Compression of the femoral was instituted by the patient, and when I reached there the hæmorrhage had ceased. A compress of dry lint was placed over the wound and a nurse directed to watch it. At 1 A. M. slight oozing commenced at wound of exit, and at 4 A. M. it gushed out in a considerable stream, but was again controlled by compression of the femoral artery. At this time about four ounces were lost, and, as no bleeding vessel could be observed, a tourniquet was placed over the femoral artery, but not tightened. July 24th, the compresses have been removed from day to day and the wounds dressed, but there has been no recurrence of hæmorrhage. The patient is taking tonics and generous diet. July 26th, hæmorrhage has just recurred. Compression of the femoral controls it. This time the patient lost about six ounces. He was etherized, and upon thorough examination it was found that the ball had severed the popliteal artery and also wounded the posterior portion of the tibia near its articular surface. Taking into consideration the wound of the bone so near the joint, if not actually involving it, together with the destruction of the soft parts along the track of the ball, it was deemed advisable to amputate rather than ligate the femoral, which would be more than equivalent to a second ligation of the artery. Amputation of the thigh at its lower third was done by flaps of skin and circular of muscles. The patient being quite weak was ordered brandy and beef tea every half hour. July 27th, slept well last night, pulse 120 and quite nervous; has but little disposition to take nourishment; ordered milk punch, iron, and quinine. July 28th, had a slight chill last evening; pulse 125 this A. M.; discharge from stump somewhat unhealthy; syringed it out with acid wash (muriatic acid, one-half ounce to pint of water). July 31st, healthy granulations are being thrown out. The acid has very much improved the appearance of the stump; general condition improving; is very despondent. August 5th, pulse 120 and feeble. Has troublesome diarrhœa; appetite poor; stump discharges quite profusely. Ordered opiate injections after each evacuation, and a wineglassful of milk punch every hour. August 8th, diarrhœa still obstinate and is running the patient down. Ordered Monsel's solution, fifteen drops four times per day. Continued injections and other treatment. August 10th, diarrhœa slightly improved. August 15th, patient has had a troublesome hacking cough for some days; skin is becoming sallow. Has evidence of pyæmia, but has had no chills. August 17th, evidently failing fast; raises pneumonic sputa; countenance anxious, mind wandering. Died August 19, 1863. As the friends wished to embalm the body no *post-mortem* could be obtained." Portions of the femoral, popliteal, anterior and posterior tibial arteries and popliteal vein constitute *Specimen* 3963 of the Army Medical Museum, and were contributed by Dr. Adams. The specimen shows a large well-organized clot near the orifice of the posterior tibial, which is severed at its origin.

In the cases in which the division of the blood-vessel is followed by primary hæmorrhage it is possible that some foreign body may be thrust into the open lumen of the artery which will prevent retraction while insufficient to act as a plug; or that there may be paralysis of the nerves of the arterial coats, preventing their retraction:

CASE 1097.—Major W. F. Smith, 1st Delaware, received a shot flesh wound of the right thigh, at Hatcher's Run, Virginia, October 27, 1864. Surgeon A. N. Dougherty, Medical Director Second Army Corps, reported: "Among the wounded I noticed Major Smith being conveyed on a stretcher to the rear, evidently, from his ghastly pallor, severely hurt, and probably suffering much from loss of blood. I accompanied him as far as the ambulances, where, with the assistance of Surgeon J. M. McNulty, U. S. V., and Assistant Surgeon C. Smart, U. S. A., Medical Inspector, I examined the wound and did what seemed necessary. The ball (minié) passed through the right thigh behind the os femoris, a little below the middle, severing the femoral artery but not injuring the bone. Hæmorrhage had already been profuse, but was partially restrained by a handkerchief and a leather strap which some one had applied. On consultation it was thought imperatively necessary to cut down upon and tie the vessel in the wound, which I accordingly tied with the assistance above mentioned and that furnished by regimental medical officers in compressing the artery at the groin. The enlarging of the wound quickly brought the upper cut end into view and enabled me to cast a ligature around it; but in order to secure the lower end it was necessary to cut across the sartorius muscle. The femoral vein also required tying. There was still considerable hæmorrhage of a dark venous character, which, as its source could not be brought into view, it was judged best to arrest by sponge compresses, the lowest one dipped in solution of persulphate of iron, after which it ceased completely. A bandage was applied and he was sent in an ambulance to the Gurley House, which he reached without molestation. Up to this time (October 30) there has been no return of the hæmorrhage. The pulse, which was scarcely perceptible at the wrist, was quite good yesterday. The leg and foot are pale and cold, with some mottling about the instep, and sensibility is quite wanting below the calf. I directed artificial heat, wrapping in flannel and cotton batting, frictions, etc." An entry on the register of the hospital shows that amputation in the middle third of the thigh was afterwards performed, and that the patient died November 6, 1864.

In the following case the complete division of the femoral artery was followed by severe primary hemorrhage, but the bleeding ceased spontaneously:

CASE 1098.—Private E. H. Clarendon, Co. I, 26th Massachusetts, aged 22 years, was wounded in action at Opequan Creek, September 19, 1864, by a minié ball, which passed through the fleshy part of the left thigh and slightly wounded the right thigh. The wounded man was brought to hospital at Winchester on September 22d. Severe hæmorrhage occurred at the time of receiving the wound, which ceased spontaneously. About eight days after the date of the injury serious hæmorrhage took place, wholly venous in character. After that time there was no recurrence, but a constant and free discharge of dark bloody pus. The patient became anæmic, feverish, and at times delirious, until he sank at length with evident manifestations of pyæmia. He died October 17, 1864. The *post-mortem* examination disclosed a large dissecting abscess beneath the fascia and among the muscles of the anterior portion of the thigh. The missile had entered about the junction of the upper and middle third of the

limb, severing the femoral artery and wounding the femoral vein. Both the proximal and distal portions of the artery were filled with firm coagula, and for about half an inch from the torn extremity of each there was a hard cartilaginous formation surrounding the vessel, which was indeed nearly osseous in character. The crural nerve was inflamed in the track of the ball, but not otherwise injured. The femoral vein was filled with a very thick pus, reaching from the wound to a point some two inches above Poupart's ligament. Above this and to within about an inch of its junction with the internal iliac the vein was filled with a firm coagulum of lymph. The distal portion of the vein contained very little pus. Purulent or lymphatic deposits were found on the peritoneum, covering the hepatic vessels; also on the anterior edge of the right lobe of the liver. Purulent deposits were also found in the spleen, and a small abscess existed at its superior edge containing bloody pus. The treatment of the patient had been of a tonic and stimulating character. The history of the case, together with portions of the injured femoral artery and vein, was contributed to the Museum by Surgeon C. H. Andrus, 176th New York. A wet preparation of the vessels constitutes *Specimen* 3794 of the Surgical Section.

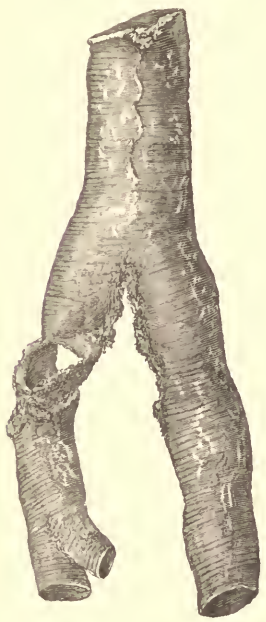

FIG. 418.—Shot perforation of right primitive iliac. *Spec.* 6336.

Cases of partial division of vessels more frequently came under the observation of the surgeon. In these cases it was usually found that only a portion of the calibre of the vessel was carried away or that perforation of the vessel had taken place. Under such conditions the retraction of the vessel is rendered impossible, and hæmorrhage ensues proportionately to the size of the artery and of the wound. A case of shot perforation of the carotid has been cited on page 751, *ante* (case of Kimball); and a perforation of the right primitive iliac by a pistol ball is shown in FIG. 418. The injured man died in twelve minutes. A partial division of the femoral vein is shown in FIG. 419. Profuse hæmorrhage followed immediately after the injury, which was with difficulty arrested by compression. Details of this case are given on page 304 of the *Second Surgical Volume* (CASE 868). If the artery is large the hæmorrhage will be profuse, and attended with speedily fatal results unless help is near at hand, as in the case of Assistant Surgeon R. S. Vickery, detailed on page 16, *ante*. The following additional data, furnished by Dr. Vickery in a letter to the editor, dated April 5, 1882, will be found of interest:

FIG. 419.—Shot laceration of right femoral vein. *Spec.* 2094.

CASE 25 (*Cont. from p.* 16).—"A partially spent rifle bullet struck me on the front of the left thigh. Profuse hæmorrhage ensued and I fell fainting. Recovering consciousness I found myself lying on a stretcher, with the artery secured by a tourniquet. It must have been done promptly, as several surgeons of the brigade and the hospital steward of the regiment were within a few feet of me when I fell, and but for that prompt and timely assistance the hæmorrhage would probably have been fatal. I was then carried by stretcher and ambulance to the division hospital, about three miles to the rear. There, as the operating surgeons were all very busy, I was placed in charge of one of the assistants, to watch that the hæmorrhage was kept in control, until the afternoon, when, having placed me under the influence of chloroform, Surgeon W. B. Fox, of the 8th Michigan Volunteers, cut down in the opening, enlarging it, and ligated the femoral artery above and below the injured part. The wound, fortunately, was well situated for ligation of the artery, being about four inches below Poupart's ligament and about an inch below the profunda, the ball entering in front, passing back close to the bone but not injuring it, and lodging in the muscles of the posterior part of the thigh about an inch below the surface, from which it was extracted at the time. The ligatures came away on the thirteenth day. On the eighteenth day, while at stool, a secondary hæmorrhage came on to the amount of eight ounces. It ceased with the aid of compression and quiet, and there was no return of it. The wound was completely healed by November 3d. On the fifteenth day I was moved from field hospital to City Point by ambulance, and eight days afterwards placed on board steamer and carried to a northern hospital. Some branch of the anterior crural nerve, probably the internal saphenous, must have been injured by the ball, as I suffered severe pain in the wound and along the leg for some days. This caused a want of sensation of the skin of the inner side of the leg from the knee down, which was greatest in the foot, and from the deficient innervation and bad nutrition of the skin gave me much trouble for years, and though it has now much improved it is the chief cause of the lameness which still continues. On March 11, 1865, seeing that I would not be able to resume my duties, I was honorably mustered out of the service at my own request, and returned to Ireland to visit friends there. When the wound healed the muscles of the knee remained contracted, so that when standing erect I could only touch the toes to the ground, and had to use crutches. As this condition did not improve by the modes of extension employed, on June 15, 1865,

Drs. Daniel Donovan and David Hadden divided the hamstring tendons of the leg subcutaneously and forcibly extended the limb. In a few months I was able to get about without crutches. The leg now remains weak, and has not regained its former size or strength; but it has never, during my service in the army, kept me a day off duty."

In the case of Booth, 7th Indiana Cavalry (CASE 21, page 14, *ante*), the femoral artery was perforated. Copious hæmorrhage ensued at once, which was arrested by the application of a tourniquet. Hæmorrhage recurred on the sixth day, which was again arrested by pressure; the wound became unhealthy, and the patient died on the tenth day after the injury. Prompt operative interference would undoubtedly have afforded a chance of life.

Sometimes hæmorrhage will continue though it may be retarded by the formation of a coagulum in the track of the wound, but the tendency is to form a diffuse traumatic aneurism, which, untreated, will exhaust the patient by frequently recurring hæmorrhage. In the case of Melley, 2d West Virginia (CASE 13, page 555, *First Surgical Volume*), the axillary had been almost entirely divided; an enormous tumor of coagulum formed in the axilla. Hæmorrhages recurring, the axillary was ligated; but during the operation the subclavian vein was accidently opened and death ensued in less than ten minutes.

The greater number of cases of injury to blood-vessels were caused by contusion. Missiles with low velocities, or those whose force is partially expended upon tissues previous to striking the artery, seldom divide or penetrate, but contuse the arterial coats, destroying or impairing their vitality, and establishing inflammatory action which results in the removal of a slough at definite periods, accompanied by profuse secondary hæmorrhage. In some cases the resulting inflammation or the injury to the vasa-vasorum effects a partial or complete occlusion of the arterial tube; if the collateral circulation becomes well established recovery may take place; but fatal gangrene of the extremity, deprived of its blood supply, very commonly supervenes.

CASE 1099.—Private Henry Knoble, Co. D, 149th New York, was wounded at Ringgold, November 27, 1863. Assistant Surgeon Norman Teal, 88th Indiana, reported: "Wounded in superior regions of both thighs and posterior part of neck; minié ball entered left thigh on outer anterior aspect six inches below superior spinous process of ilium, dipped beneath the integument and deep fascia, and emerged on inner surface of thigh four inches below pubis; the wound of the right thigh was supposed to have been made by the same ball after passing through the left. I saw the case for the first time on December 11, 1863; removed the ball from the wound of the neck. On examination found the left foot in a state of humid gangrene, with a line of demarcation encircling the ankle at the malleoli. On inquiry learned that this soldier had been brought hither from the battle-field after suffering considerable exposure to cold on the battle ground and during transition; that the foot was cold and insensible at the time of the patient's admission into hospital; that he arrived here hungry and cold on the morning of November 28th, the next day after the injury; that he had diarrhœa at the time the wounds were received, and that he had suffered from this disease more or less during his sojourn in hospital. Know nothing of the treatment previous to December 11th. After this time opiates were exhibited to control the bowels and tonics and stimulants to invigorate and support the system. Amputation of the leg at the junction of the middle with the lower third was performed on December 14th; artery controlled by thumb alone. Very little hæmorrhage; parts at point of section flabby. Treatment mentioned above continued; alcohol, full strength, applied to stump freely from the first; but little inflammation occurred, and but feeble efforts at reparation were made. Granulation sparse and flaccid throughout; appetite pretty good. My connection with this case ceased about the last of December. Dr. Kilbourne then assumed charge. Death took place January 14, 1864, on the 48th day after the injury and the 31st after amputation. Autopsy: Wound in left thigh closed; track of ball occupied by an abscess containing thin fetid pus. The course of the ball appears to have been posterior to the artery, impinging upon its sheath, for the wall of the artery at this point is thickened, of a brownish color, and its calibre diminished one-half. A firm coagulum fills the sheath for one inch below the track of the ball. Bones protruded between the flaps, which were lined with an ash-gray slough. The elaborate *post-mortem* examination in this case is omitted as unnecessary to the description of the specimen, illustrating as it does death by pyæmia. The gangrene in this case was clearly due to the diminution of the calibre of the artery and to the cold and exposure to which the man was subjected; neither cause sufficient of itself to have produced the result." *Specimen* 2114, Section I, Army Medical Museum, consists of a wet preparation of the upper portion of the left femoral artery, with the walls much thickened by a coagulum in the sheath. It was contributed by Dr. Teal.[1]

Not unfrequently spiculæ of bone driven before a missile puncture blood-vessels, and though they may not be productive of instant trouble, they set up inflammatory action, resulting in ulceration and sloughing attended with secondary hæmorrhage.

An example of division of the intercostal artery by the fractured end of a rib has been

[1] An abstract of this case was published by Dr. JOHN A. LIDELL in *U. S. Sanitary Commission Memoirs*, New York, 1870, Surgical Vol. I, p. 27.

cited on page 551 (Case of Butterfield) of the *First Surgical Volume*, and an instance of rupture of the popliteal by a fragment of bone is here adduced:

CASE 1100.—Private Jonathan Wining, Co. A, 125th Ohio, aged 25 years, was wounded at Resaca, Georgia, May 14, 1864. He was at once admitted into the field hospital of the 2d division, Fourth Corps, where the injury was recorded as a flesh wound of the left thigh. He was subsequently treated in hospital at Nashville, and on August 25, 1864, was transferred to "Joe Holt" Hospital, Jeffersonville, Indiana. Surgeon H. P. Stearns, U. S. V., reported: "Compound fracture of lower third of femur by conoidal ball. October 12th: Patient enfeebled and anæmic by constant discharge of pus. Pulse frequent and soft, tongue moist and clean, appetite good, bowels regular. Femur much shattered; ends overlapped and partially united. Soft parts destroyed by gangrene, exposing blood-vessels; rupture of popliteal artery by a fragment of bone. Chloroform administered and antero-posterior flap amputation of the middle third of the thigh performed by Dr. Stearns. The flaps subsequently sloughed, exposing an inch of the femur; repeated hæmorrhages also occurred. Quinine, opium, and whiskey administered and cold-water dressings applied. December 17th: Every indication of recovery; flaps nearly healed. The man is in fine health and spirits; all medicines have been suspended and nourishing diet alone depended upon." Wining was transferred to Cleveland, Ohio, March 24, 1865, and discharged from service May 20, 1865. He is a pensioner.

Wounds closely resembling incised wounds frequently are caused by sharp-edged shell fragments flying with great velocity; but a certain amount of contusion and laceration, always present, separates them from the class of purely incised wounds.

Missiles and foreign bodies lodging sometimes act as plugs, restraining for a time hæmorrhage from a wounded blood-vessel. An interesting case of occlusion of the common carotid by an impacted ball is related by Surgeon John A. Lidell:[1]

CASE 1101.—"At the Washington Infirmary, August 15, 1861, through the kindness of Dr. J. W. S. Gouley, then attached to the medical service of the U. S. Army, the author had an opportunity to examine a very interesting preparation of the left common carotid artery and the parts adjacent to it, which had been obtained on the previous day at the autopsy of a soldier who had died from secondary hæmorrhage following a gunshot wound of the left side of the face and neck. The ball, which, by the way, was nearly spent, struck the lower jaw well forward and was deflected downward, backward, and a little outward in such a manner as to pass obliquely through the left common carotid artery, and to lodge in the tunics and sheath of that vessel underneath the omo-hyoid muscle, pressing somewhat upon the par vagum, and *occluding completely the proximal end of the divided artery.* It was a round ball. The hæmorrhage occurred *fourteen days* after the wound was inflicted and two or three days after his admission into the infirmary. It came on suddenly, without warning, and was very profuse. The patient lost more than a quart of blood, which flowed in a great stream from his mouth. On the supposition that the hæmorrhage proceeded from a lesion of some of the carotid vessels, an effort was made to tie the common carotid above the omo-hyoid muscle, but it had to be abandoned on account of the great profuseness of a flow of blood which took place in the wound of operation, and did not permit the search to be continued in order to secure the bleeding vessel by ligature at the place of injury. It was believed by all the surgeons present that the patient was now so much exhausted by the loss of blood as to make it useless to attempt to tie the common carotid artery below the omo-hyoid muscle, and the next morning he died. Moreover, the source of the hæmorrhage was very obscure until it was revealed at the autopsy. *It was then found that the divided carotid artery was still occluded on the side of the wound toward the heart (proximal) by the impacted ball; that a false aneurism as large as a filbert and elongated in shape had been formed at the distal extremity and on the inner side of the wounded artery just above the omo-hyoid muscle; that the hæmorrhage occurred from rupture or spontaneous opening of the sac of this traumatic aneurism; that the hæmorrhage was not direct, but recurrent in character; and that it could not have been arrested without the application of a ligature to the vessel on the distal side of the wound in it.* The ligation of the common carotid below the omo-hyoid muscle would, therefore, not have done any good, unless the vessel had been tied at the same time at some point beyond the spot where it was wounded and where the traumatic aneurism was situated. A remarkable and, so far as the writer knows, an unique feature of this case was, that the traumatic aneurism was formed in connection with the distal end of the divided common carotid artery, the occurrence of which appears to have been favored by the free anastomosis which exists between the terminal branches of both the external and internal carotid arteries of the two sides of the body." The above has been identified as the case of Corporal Jonathan Calef, 2d New Hampshire. An abstract of this case has been published by Medical Cadet L. H. Bodman, U. S. A.,[2] who states that the man was injured by a sentry, August 7, 1861. There was considerable hæmorrhage at the time of the accident, but when admitted to the hospital a few hours afterwards he was in a comfortable condition, bleeding having entirely ceased. No search was made for the ball, but the edges of the fractured bone were retained in apposition by means of a suitable bandage, and quiet enjoined. Diet consisted of nutritious soups and beef tea. The patient continued in good condition until the afternoon of the 13th, nearly a week after the reception of the injury, when, lying quietly in bed, he was seized with violent arterial hæmorrhage. The blood poured from his mouth, welling up with each pulsation of the heart. Compression over the carotid was instantly resorted to, but a quart of blood had escaped before the hæmorrhage was controlled. The patient being now very weak, stimulants were administered and directed to be given frequently through the night. Continuous compression was kept up over the artery. Bleeding recurred twice during the night and was controlled with great difficulty. He sank rapidly, and died on the morning of August 14, 1861, by syncope, in another and terrible attack of hæmorrhage.

CASE 1102.—Private John Jones, 187th New York, aged 27 years, was admitted into Jarvis Hospital, Baltimore, February 11, 1865, with a gunshot wound of the mouth and throat, received at Hatcher's Run, Virginia, on February 6th. The

[2] BODMAN (L. H.), *Gunshot Wound of Carotid Artery—Secondary Hæmorrhage*, in *American Medical Times*, New York, 1862, Vol. IV, p. 67.

patient, at the time of admission into the hospital, was able to walk about, and a casual observer would have thought him to be in nowise a dangerous condition. The musket ball had entered directly the mouth and in its progress carried away the upper and lower incisors and canine teeth, and passing backward lodged, but where was not discovered until the *post-mortem* revealed the fact. The index finger inserted into the mouth found that it had wounded the right side of the tongue, and from thence the track ran to the right side of the neck and backward through the pillars of the fauces and then could not be further traced. The patient himself thought that he had swallowed the ball. The only inconvenience he suffered was in either talking or swallowing, and when resting on his back; and being so apparently comfortable it was not thought best to trouble him, but orders were given to the nurses to watch him closely. An examination externally revealed no signs of injury, and the only symptom there marked was tenderness over the upper vertebra and general soreness of the muscles of the neck. He had not the least sign of paralysis, and the day previous to his death he was walking about his ward, and even requested his medical attendant to extract for him a tooth which was almost detached by the ball and was giving him some annoyance. On February 12th (six days after the injury was received), at 5.30 P. M., a most furious arterial secondary hæmorrhage occurred through and out of his mouth. Before assistance could reach him (although close at hand) he had bled so copiously as to be in a state of syncope, and while bleeding he had two convulsions, one of which was quite violent. During the active hæmorrhage pressure was made over the common carotids, yet it did not seem to control it to any great extent, and notwithstanding various expedients were employed it only stopped when syncope came on. It is proper to state, also, in this connection, that pressure from within by the fingers did not stay the hæmorrhage, but to his detriment increased the suffering of the patient. The exhausted condition of the patient at this time rendered it inexpedient to resort to any operative interference. The hæmorrhage having entirely ceased through this effort of nature, it was ordered that diffusible stimulants be freely given in such quantities as the stomach could bear, and that ice should be constantly kept applied to the parts, and under this treatment he slowly rallied and rested quietly until 5 o'clock on the following morning, when a gush of blood took place from the patient's mouth and he expired. An autopsy was made twenty-four hours after death, and the track of the wound was thoroughly explored, after both common carotids had been injected with a suitable material, which, on cooling, hardened and distended the principal arteries of the head and neck. On the plan of operating recommended by Mr. Guthrie on the living subject, an angular flap of the integuments was made corresponding with the ramus and body of the lower maxillary bone, and this integument was turned back, and by the saw the bone was divided near the first lower molar tooth and the upper fragment raised. By a little dissection the wound was fully exposed and the first vessel wounded was ascertained to have been the right internal carotid, which was converted into a traumatic aneurism for near its entire length, and its position was occupied by an extensive clot of blood. On introducing the finger into the track of the wound at this point and carrying it almost directly backward and inward, the ball was found loosely resting against the transverse process of the first cervical vertebra, and was easily extracted without the aid of forceps. By further careful exploration of the parts adjacent to where the ball was arrested in its progress it was ascertained that the right vertebral artery had been extensively lacerated at the point where it passes through the foramen of the transverse process of the atlas, and that the ball resting there had probably acted as a plug in preventing hæmorrhage from that artery, and in proof of this assertion no clots of blood were discovered here. The right transverse process of the atlas was completely fractured and comminuted, and the fragments were readily removed *en masse* simply with the fingers and without any force. This fracturing of this process of the atlas was, on further investigation, found to extend through the ring down to the spinal cord, yet the fragments were not driven in upon, or were they apparently causing any pressure on the cord. On examining the brain, heart, and lungs they were found healthy and in a normal condition, but were exsanguinated. Assistant Surgeon D. C Peters, U. S. A.,[1] who transmitted the above report, remarks: "It is somewhat remarkable that this soldier was not killed outright, or having lived so long he should not have suffered from paralysis in some form, and, in fine, that his terrible wound should have given him so little trouble up to the time of his first hæmorrhage. In my humble opinion operative interference at any stage of the treatment would not have saved nor even prolonged his life."

In many cases where both artery and vein are divided the injury of the vein assumes less practical importance at the time from the more serious lesion of the artery; but cases of secondary hæmorrhage from veins which have been contused and subsequently slough are found to be not infrequent, as will be seen hereafter.

LODGEMENT OF MISSILES AND PROJECTILES.—Cases of lodgement of missiles, projectiles, and foreign bodies in the persons of the wounded were of extremely frequent occurrence during the late war. Although it is not possible to give with any accuracy the frequency of such lodgements, it can be confidently stated that the percentage was very large.

Round balls are more prone to lodge than those of a conoidal form, as would naturally be inferred from the rapidity with which the former lose their initial velocity and the resistance offered to their passage through the tissues of the body. Conoidal balls at ordinary range preserve sufficient force to perforate the body; but at long range, or with velocity diminished by contact with intervening objects before reaching the body, or when the posture is such as to compel a long course through the tissues, lodgement very commonly occurs. As a general rule the lodgement of conoidal missiles is deeper than that of round balls.

[1] An abstract of this case was also published in the *American Journal of Medical Sciences*, 1865, Vol. XLIX, p. 373.

Instances of the lodgement of the larger class of projectiles, as solid cannon balls, grape-shot, and fragments of exploded shell, have been cited on pages 240 of the *Second Surgical Volume*, on page 746 (CASE 1040) of the present volume, and elsewhere.

The collection of the Army Medical Museum furnishes many specimens, not only of missiles and projectiles proper removed from the persons of soldiers, but also of foreign bodies, as buttons, coins, pieces of pocket-knives, shreds of clothing, portions of the accoutrements of the soldier, and fragments from objects torn off by a missile in its course, as iron wire from the bail of a tin bucket, a portion of a ramrod, a tompion nearly entire, etc. Not infrequently pieces of bone or teeth from a wounded comrade driven before a missile became themselves wounding missiles. Splinters of wood and iron, stones, and débris from artillery caissons and carriages, from breastworks and defenses, acted in a similar manner. All parts of the body share the liability to lodgement.

The direct effects of lodgement are those common to the presence of foreign bodies generally in the tissues of the human structure; they become the centres and sources of irritation, liable to be followed by symptoms of every degree of severity in nature's effort to rid herself of the offending matter. These symptoms largely depend upon the size, nature, and form of the intruding body; also upon the region of the body involved.

The most serious results follow the lodgement of missiles and foreign bodies in joints and cavities of the body, or in organs necessary to life; even small missiles, with qualities the least irritating, may be the cause of great mischief by the production of tetanus and hæmorrhage, when lodged where they may cause pressure upon nerves or blood-vessels.

Passing from the more immediate or primary effects of irritation and inflammation resulting from the lodgement of foreign bodies, we find that the usual tendency of their continued presence is to prevent or retard the course of healing. Cicatrization is slow and liable to be interfered with by any aggravation of the primary irritation; the wound takes on a condition of chronic inflammation, sinuses form with purulent discharges, sapping and undermining the strength and vigor of the patient, opening the way for the invasion of any of the surgical complications which may be near at hand. Especially does this seem to be true of substances of organic nature, as shreds of wool or cotton, or splinters of wood. Until such substances are removed by nature or art the progress of the case toward health is usually entirely held in abeyance. Foreign bodies of a metallic nature, particularly those with smooth surfaces, seem to act more kindly; they frequently permit the closure of the wound; but if their location is subject to frequent movements the wound is liable to reopen; this process may be repeated until the offending body is removed or discharged.

In many cases of lodged missiles the tendency to move or change place is observed; slowly and gradually the substance will work to the surface of the body, where it will often form an abscess and be discharged, or it may tend toward the internal surfaces of the great cavities, where its presence may be productive of great harm; or, on the other hand, it may be harmlessly ejected from the body. Thus balls lodged in or about the abdominal region and of which the exact position had not been ascertained have finally been passed by stool *per vias naturales*. Scraps of iron and lead have been known to work their way through the coats of the bladder, where they became the nuclei of vesical calculi which were subsequently removed by lithotomy. The collection of the Army Medical Museum contains several specimens of this nature; also of portions of bullets and shell fragments which have been similarly lodged in the bladder and removed by operation. Cases of this nature have been recorded on pages 269–276 of the *Second Surgical Volume*. The Museum collection

also contains missiles which had for years lodged within the cranial bones. The least harmful effects of lodgement are seen in the cases of balls lodged in the muscular or cellular tissues of the body and in regions of little vital importance. Musket balls have remained encysted for years, causing but little trouble or inconvenience. At the Soldiers' Home, near Washington, it is not uncommon to find old soldiers who have carried encysted bullets for long periods in their persons with little more inconvenience than slight neuralgic pains during damp and unpleasant weather. The writer has in mind the cases of two soldiers, one wounded in the lower maxillary region during the Mexican war, the other in the gluteal region during the late war, in both of whom the balls are firmly encysted; the missiles give so little trouble that the suggestion of removal is not received with favor. A most remarkable instance of the encysting of a ball is that of Lieutenant E. B. Blake (CASE 552, on p. 372, *ante*), who carried for fifteen years a full-sized conoidal bullet in the cancellated structure of the condyles of the femur, experiencing but little trouble.

PRIMARY SYMPTOMS COMMON TO GUNSHOT WOUNDS.—The immediate symptoms common to shot injuries are pain, shock, and hæmorrhage. To be duly appreciated in their primary state they must be seen on the battle-field, as they are speedily evanescent, fatal, or merge themselves into conditions pertaining to the later stages of shot injuries.

Shock.—Severe shot injuries, particularly those involving the larger bones and the more important organs and cavities, are followed by a train of phenomena known as "shock," or a general perturbation of the nervous system. Upon the reception of such injuries the person affected turns suddenly pallid, trembles, and, may perhaps fall to the ground; the surface of the body is cool and bathed in profuse perspiration; the features indicate anxiety and distress, the respiration is labored and sighing, the circulation is feeble, the mental condition is often one of agitation resembling fear, or there may be an entire loss of self-control; at times, in severe cases, consciousness is lost, and finally death may ensue without reaction.

The degree of shock seems to bear some relation to temperament, to physical condition, and to the region of body affected. Equal degrees of injury seem to affect individuals differently. While some are apparently overwhelmed by the shock, others maintain their self-control and composure; in some, shock seems to heighten the excitement under which the individual is laboring during a battle; in others, the effect is to produce a sense of fear and panic. As a rule, the more severe the injury the greater will be the degree of shock. Injuries caused by the larger projectiles, as the loss of a limb near the trunk, is generally followed by depressing shock, and this independent of any loss of blood. Generally, shock is more profound and persistent in grave wounds of the abdomen than in wounds of any other part of the body. Profound and even fatal shock has been the occasional consequence of shot contusion of the parietes of the abdomen, as in the case of Major King, British Fusileers,[1] who was killed at the battle of New Orleans, January 8, 1815, by a musket-ball, "which struck him on the pit of the stomach, leaving only the appearance of a contusion, apparently in the same manner as a blow from the hands of a pugilist in the same part."

Wounds producing great splintering and comminution of long bones are generally followed by a severe degree of shock. The duration of shock is very variable, sometimes lasting but a few minutes; at other times showing great persistence, and continuing for hours or days. Here, too, individual temperament and idiosyncracy seem to exert a large

[1] GUTHRIE (G. J.). *A Treatise on Gunshot Wounds, etc.*, London, 3d edition, 1847, p. 5.

influence. When shock is very persistent the prognosis is to be very guarded, as its persistence may depend upon some severe or fatal injury, as was probably the case in the following instance, reported by Surgeon E. Swift, U. S. Army:

CASE 1103.—Private *A. P. Pringle*, Co A, 25th Louisiana, aged 24 years, temperament bilious, occupation farmer; wounded at the battle of Stone's River, near Murfreesboro', Tennessee, December 31, 1862, by a minié ball under the left shoulder, through pectoralis major. The shock knocked him down and he fell across the railroad track on his left hip. He complained more of this than of the wound; suffered intensely from pains in his hip, back, and leg; quieted pains with morphine, and was obliged to use a catheter twice daily as long as he lived. The wound healed very well, but he never recovered from the shock of the fall. He had no appetite from the first. All the nervous symptoms increased in intensity; he had no rest except from morphine, and for two or three days before his death he could not move at all. Died January 11, 1863.

Shock may be the actual cause of death of many cases on the battle-field, especially in severe injuries of the abdomen. Of twenty-seven fatal cases of shock fourteen were found to be shot wounds of the abdomen and eight of the femur. Fatal shock is more frequently a sequel of wounds by large projectiles than by bullets. Longmore[1] found that out of twenty-two deaths from shock only eight were caused by bullets, and in all of these the cavity of the abdomen had been penetrated by the projectile. In the remainder the injuries were from gunshot, shell, or grape.

Pain.—Pain as a primary symptom of shot injury is rarely absent. In degree it may be slight or severe according to the locality of the wound, its nature, and the mental condition of the individual. In simple flesh wounds it is commonly described as stinging or cutting, as from a blow by a cane; it is sometimes likened to the passage of a hot wire through the part; by others it is described as dull, like the blow from some heavy body. When nerves are injured or contused the pain is usually severe, but is commonly referred to parts supplied by the nerve. In some cases the pain is referred to parts distant from the seat of injury, as in the case of Lieutenant William F. Goodwin, 16th U. S. Infantry, who was wounded at Chickamauga, September 19, 1863, by a conoidal ball, which caused a severe flesh wound of the left thigh. He felt no pain of moment in the wounded limb, but had a firm impression that the wound was in the right limb. The case is referred to by Mitchell, Morehouse, and Keen (*loc. cit.*, page 14). When large nerve trunks are divided there is momentarily intense pain, immediately succeeded by loss of sensation in parts depending upon the nerve trunk. In severe wounds generally the pain which accompanies them is lost in the anæsthesia of the shock which soon follows.

Pain resulting from shot contusions of bone is often severe and widespread, especially if the injury is insufficient to cause unconsciousness.

CASE 1104.—Captain A. L. Dearing, Co. H, 5th Maine, aged 28 years, was wounded at Chancellorsville, May 3, 1863. He was admitted into Seminary Hospital, Georgetown, on May 8th. Surgeon H. W. Ducachet, U. S. V., reported: "Gunshot wound of left thigh bone." The following account of the case was furnished by the patient: "I was wounded," says this officer, "on Sunday, May 3d, by a round musket ball in my left thigh, very near the hip joint, the enemy being fifty or sixty yards distant. The sensation produced when the ball struck me was as though a ball of glass had been thrown with irresistible force and shivered to atoms against the bone of my thigh. This sensation was very distinct, and no other was felt for the instant. I have no recollection of falling; but found myself lying on my left side, with a strange feeling of numbness *rushing* through the entire leg. This lasted but a few moments; the blood flowing freely, this *active* numbness soon died away. I believed myself mortally wounded, as I had no doubt the bone was shattered to the hip joint. Dreading to fall into the hands of the enemy I dragged myself from the battle-field about two hundred yards, when some of our men carried me to a place of safety. Taken to the hospital at Falmouth on the 4th, my wound was probed by Surgeon N. S. Barnes, 27th New York, on the morning of the 5th. The probe struck the bone and followed the wound a short distance around it on the inside, without feeling the ball. Surgeon Barnes decided that the ball struck the bone, and, without injuring it, glanced to the right, passing around to the opposite side from which it entered, and probably lay deep in the groin; but my thigh was so much swollen that the ball could not be found. On May 8th I reached Seminary Hospital, Georgetown. At length, after the swelling had subsided considerably, the ball was found near the groin and near the surface. It was extracted by Surgeon Ducachet on May 18th, but this ragged, misshapen piece of lead was so light that doubts were expressed as to its being a whole ball. The wound seemed to be doing well; there was considerable yet no very severe pain, the severest and most continuous being in that region where the ball entered and

[1] LONGMORE (T.) *Gunshot Injuries: their history, etc.*, London, 1877, p. 150.

struck the bone. On May 27th a small piece of bone was discharged from the wound, indicating that the bone was more or less injured. On May 28th I was attacked with a most intense pain on the inside of the thigh, midway between the wound and the opening where the ball had been extracted. This pain brought on fever and a severe headache. Chloroform liniment was freely applied and alleviated the pain. On May 31st a piece of lead made its appearance at the opening where the ball had entered, and was extracted by Dr. Miller, and proved to be very nearly as large as that extracted on the 18th. This second piece of lead is very ragged, and holds a portion of the cloth which it had carried into the wound. About the first of June the nerves of my left foot, mostly in the toes, commenced troubling me, causing many sleepless nights and restless days for two weeks. It was like a continuous nervous toothache. A powerful chloroform liniment was freely applied, but it proved less effectual than cold water in easing the pain. This pain was not constant, but would burn my toes as with boiling water for ten or fifteen minutes, then ease away somewhat for a few minutes, and then return in full force. On June 12th a course of vigorous rubbing with a coarse towel was commenced on the foot and leg to the knee. On the third day the pain began to yield, and has now, June 24, 1863, almost ceased. My leg remains as yet almost perfectly helpless. It cannot support its own weight. My general health is very good." The patient was discharged from service September 15, 1863, and pensioned. The Hartford examining board reported, August 7, 1872: "Ball entered at middle of left nates and passed forward; part of the ball was removed at the junction of the upper and middle thirds of the left thigh at the outer border of the sartorius muscle. In its passage the ball struck the inner side of the femur, and in consequence of which portions of bone, with the remainder of the ball, were discharged through the point of entrance in the nates. The knee becomes swollen and painful from slight use."

Under the stimulus of great excitement, as that prevailing during an active engagement, men may receive wounds without being aware of the fact until their attention is drawn to the blood flowing from the wound, or until they are affected by faintness from the loss of blood. Race and temperament undoubtedly exert a modifying influence on the degree of suffering. The white races, as a rule, seem to be more susceptible to pain and to suffer more acutely. The negro soldiers engaged in the late civil war bore their sufferings with great fortitude and patience; but it is questionable if the actual degree of suffering was as great as that of the white soldiers. The nervous and sanguine temperaments show a greater capacity for suffering than the lymphatic or lethargic temperaments.

Primary Hæmorrhage.—Primary hæmorrhage, or the loss of blood immediately upon the receipt of an injury severing or wounding a blood-vessel, has been alluded to as causing speedily fatal results, or as ceasing spontaneously by the retraction of the coats of the bleeding vessels, by syncope, or followed by such retardation of the flow of blood as to allow assistance to reach the wounded man, rendering him secure for a time at least.

As a result of the experience of the late war it may be stated that primary hæmorrhage, within the bounds of possible succor, was infrequent; yet without doubt many wounded men perished through lack of self-possession, want of coolness, or of sufficient knowledge to save themselves.

It is probable that a large percentage of the "killed in battle" were cases where primary hæmorrhage followed the division of important vessels, death ensuing instantly or before help could be procured. Surgeon John A. Lidell, U. S. V.,[1] was convinced, from his own observation, "that a large proportion of the persons killed in battle perish directly from loss of blood: On the 25th of March, 1865, I examined the bodies of forty-three soldiers as they lay dead where they had fallen on the field of combat at Fort Steadman, in the lines before Petersburg. Of them 23 were wounded in the cranium, 15 were wounded in the thorax, 5 were wounded in the abdomen. The blanched and exsanguinated appearance of the cadaver in every case wounded in the abdomen denoted clearly that death had been produced by hæmorrhage, and the extreme rapidity with which that result had taken place implied that some large blood-vessel had been injured. In all but two or three of the cases wounded in the thorax the body presented a blanched and exsanguinated appearance, occasioned by hæmorrhage. There was much blood in the clothing and on the ground where they had fallen in most of the cases wounded in the trunk. This fact shows that the fatal hæmorrhage generally took place externally. There were, however, some cases wherein

[1] LIDELL (J. A.), *On the Wounds of Blood-vessels, Traumatic Hæmorrhage, etc.*, in *U. S. Sanitary Commission Memoirs*, Surgical Volume I, p. 12.

death had been produced by internal hæmorrhage. While the bodies of these were pallid and wax-like, there was but little blood in their clothing and on the ground where they lay. All the wounds appeared to have been inflicted by cylindro-conoidal bullets."

Primary hæmorrhage from wounded veins is generally regarded as of less imminent importance than that from wounded arteries. It was stated in the preliminary report (*Circular* No. 6, 1865, p. 39) that "no cases have been reported in which the bleeding could not be controlled by pressure." A further examination of the material at hand makes it necessary to somewhat modify this statement. Primary hæmorrhage from large trunk veins lying in cavities and beyond the reach of ligatures appear to be as fatal as that from arteries. A case of this nature is reported on page 71 of the *Second Surgical Volume*. A colored teamster shot in the abdomen died forty-two hours after the injury. At the autopsy the abdomen was found distended with clotted blood from one of the mesenteric veins which had been cut.

Primary hæmorrhage from the jugular and femoral veins would appear to be less amenable to treatment than that from others which yield to pressure or cease spontaneously. A case illustrating primary hæmorrhage from the femoral vein is reported on page 338 of the *Second Surgical Volume* (CASE 981): a private of the 110th Ohio was wounded at Fort Steadman, March 25, 1865; the ball entered the right thigh, cutting across the femoral vein, and lodged in the gluteal muscles; hæmorrhages followed continuously, which were at times checked by styptics. Death occurred April 11, 1865.

Early in the war it was recommended that each soldier should have in his possession some simple form of tourniquet, and in many instances the recommendation was carried out; how far they were of use is not known, as no cases are recorded of life being saved by them; but it is probable that they were little used, and it is very doubtful if, in the excitement and confusion of battle, they could have been applied with any efficacy. Later in the war experience taught the older and more experienced troops to do all that could be done in cases of emergency.

HÆMORRHAGES AND LIGATIONS.

Of the many complications of shot wounds, perhaps none plays a more important part than hæmorrhage. Injuries, apparently trivial, prove fatal in the most unexpected manner, as the lesion to the artery causes at first little or no disturbance; or hæmorrhages occur in cases in which, judging from the direction of the ball, no injury to a blood-vessel could have been surmised. Thus the prognosis of the shot wound becomes exceedingly problematical, and the surgeon not infrequently is suddenly roused from a feeling of security and brought face to face with an unexpected and serious complication, which, under the peculiar necessities of war, is of difficult treatment; and the results thus far have been by no means as satisfactory as could be wished. Too often the surgeon is induced to await developments rather than to resort to prompt action.

It has therefore been thought desirable to give in the following pages as complete a summary of the cases of hæmorrhage, whether primary or secondary, as space would allow. Details of many cases have appeared in this and the preceding volumes, and in a few instances partial tabular statements of ligations of the more important blood-vessels have been adduced. But during the progress of the work many additional cases were ascertained and additional data were found of cases already reported; all will here be grouped together in as concise a manner as possible to aid the student interested in the investigation of this

important branch of military surgery in his researches in this direction. As already stated in the consideration of the effects of missiles and projectiles on blood-vessels, it is difficult to distinguish the injuries inflicted by one or another of the more common forms of bullets; but it would seem, nevertheless, from the large series of bleedings reported during the war, that the introduction of the elongated bullet, thrown from a rifled weapon, has largely increased the number as well as the gravity of the injuries to blood-vessels. The injuries of the arteries will be first considered, and those of the veins unattended by lesions of the accompanying arteries are reserved for a special subsection.

ARTERIES.—The number of arterial hæmorrhages found on the records of the field and general hospitals was three thousand two hundred and forty-five (3,245). One thousand six hundred and forty-nine of these bleedings occurred in the lower extremities, eight hundred and seventy-eight in the upper extremities, two hundred and ninety-one were hæmorrhages of the head, face, and neck, and four hundred and twenty-seven of the trunk. Of the three thousand two hundred and forty-five cases recorded, the blood-vessels involved were not named in one thousand and ten instances; and as the details of these cases are not as complete as those of the remaining two thousand two hundred and thirty-five, in which the bleeding vessels were definitely ascertained, the former will be dropped in the further discussion of the subject.

The cases have been grouped in a tabular statement, adducing: First, the bleedings of the ramifications of the ascending aorta in the chest, neck, head, and upper extremities; and next, those of the descending aorta in the abdomen, pelvis, and lower extremities; and lastly, the few examples of pulmonary hæmorrhages. The tables also indicate the number of cases in which pyæmia, erysipelas, tetanus, and gangrene were recorded as complications, the number of cases in which death was ascribed directly to hæmorrhage, and the proportion of cases in which primary injury to vessels and primary bleedings were observed:

TABLE CXXIV.

Summary of Two Thousand Two Hundred and Thirty-five Cases of Arterial Hæmorrhages of the Head, Neck, Chest, Trunk, and Upper and Lower Extremities, in which the bleeding vessels were indicated by name.

The number of cases of primary lesions of blood-vessels was quite large, comprising four hundred and eighty-five, or nearly one-fourth of the two thousand two hundred and thirty-five cases. Of these, one hundred and ten were immediately followed by hæmorrhage. To what extent the injuries to arteries influenced the mortality rate among the wounded will be seen from the fact that of the two thousand two hundred and thirty-five instances in which bleedings formed an important element, one thousand three hundred and eighty, or 61.7 per cent., proved fatal, while, of the total number of shot wounds, as indicated in TABLE CXIX, page 691, *ante*, only 13.6 per cent. ended in death. Nor can this high rate of mortality be attributed to the presence of other complications, such as pyæmia, gangrene, erysipelas, tetanus, etc., as the fatality of the cases in which these diseases occurred comprised only 20.5 per cent. of the whole number of deaths, while in six hundred and fifty-three instances, or 47.3 per cent., death was ascribed directly to hæmorrhages, and in 22.2 per cent. to exhaustion following severe or continued loss of blood.

Of the two thousand two hundred and thirty-five cases of hæmorrhage in which the bleeding vessels were specified, one thousand one hundred and fifty-five were followed by ligation. Many of these instances of ligation, especially of the larger arteries, have already been cited in this and the preceding volumes, sometimes in detail, sometimes in partial tabular statements. For the convenience of the reader all have here been grouped together in a numerical statement, which will be followed by nominal lists arranged according to the various blood-vessels operated upon.

Four hundred and seventy-one cases terminated in recovery, and six hundred and eighty-four in death, a mortality rate of 59.2 per cent.

Ligations of the Common Carotid.—Eighty-two cases[1] of ligation of the common carotid were reported; nineteen recovered and sixty-three proved fatal, a mortality of 76.8 per cent. The operations were performed for hæmorrhages from the common carotid in four cases—two recoveries, two fatal; for hæmorrhages from the internal carotid in four cases—all fatal; for injuries of the external carotid in eleven cases—one recovery, ten fatal; and in twenty-eight instances, with eight recoveries, for hæmorrhages from branches of the carotids—the lingual in seven, the auricular in one, the temporal in two, the facial in five, the maxillary in eleven, the middle meningeal in two cases. In one case it was found at the autopsy that the hæmorrhage had occurred from the vertebral artery. In the following the bleeding occurred from the internal carotid on the eighth day:

CASE 1105.—Sergeant P. B. Messenger, Co. A, 111th Pennsylvania, aged 33 years, was wounded at Lookout Mountain, November 24, 1863. He was admitted to a field hospital of the Twelfth Corps and transferred to the General Hospital at Tullahoma five days afterwards. Surgeon B. Woodward, 22d Illinois, in charge of the latter, described the case as follows: "The injury consisted of a compound comminuted fracture of the right lower jaw, the ball passing in at the angle of the mouth, going backward through the neck, and making its exit close by the cervical column. Water dressings were applied and opiates were administered. By December 2d the wound was discharging freely, no attempt having been made to remove any portion of the fractured bone by reason of the great amount of swelling. At noon the patient fed himself with soup; but at 1.30 P. M. I was called to him and found four quarts of blood collected in a large tin basin. Arterial blood was also pouring in torrents from his mouth. On introducing the finger it was found that the internal carotid had sloughed, when I pressed lint soaked with solution of persulphate of iron firmly back against the bleeding artery, and, holding it there with my finger, directed Assistant Surgeon H. Pearce, 150th New York, to cut down and take up the common trunk, which he did. Before the artery was taken up the patient had a severe convulsion from the loss of blood, rendering the operation very difficult. The lint was left in situ, though the blood ceased to pour from the artery immediately after the operation; pulse at the wrist imperceptible; breathing gasping. The patient was allowed to lie on the table for four hours, being wrapped in hot blankets. At 9 P. M. the pulse was perceptible but very weak; patient made to swallow pure extract of beef in teaspoonful doses every fifteen minutes and through the night. After he was removed to his bed extreme vigilance was kept up, and at 11 P. M. I gave him one-fourth of a grain of morphia. The following morning his pulse was 160 and very feeble. He had not slept any, but his bowels had moved well and he had urinated. There had been no bleeding, and at 10 A. M. the lint was removed and his mouth cleaned out. By 8 P. M. he had slept two hours, his pulse was 130 and fuller, and he was given one drachm of wine with two drachms of extract of beef every two hours. During the next night he slept well; pulse 120 and growing fuller; no hæmorrhage; wound in neck suppurating well; patient sitting raised in bed and takes nourishment freely; feels well but weak; no cerebral symptoms; bowels moved; urinates freely. At 2 P. M. his pulse was 110 and he felt well enough to dictate a letter to his wife. At 8 P. M. on December 5th he was still doing well, his head feeling clear; pulse 98 and growing full; appetite good; craves oysters, which are given as freely as he wishes. No change took place until the night preceding December 8th, when his pulse become 120 and very soft; evidences of cerebral symptoms beginning to show themselves, such as hebetude and listlessness; breathing very feeble; slight but perceptible divergence of the right eye. His appetite, which had been good, was now failing. At 5 P. M. there was great hebetude and he could hardly be roused, though rational when roused; eyes winking; pulse 120, very soft and feeble. Coma came on at 8 P. M. and complete paralysis of the left side. Death occurred at 1 A. M. on December 9, 1863. The autopsy showed every part of the brain to be covered with lymph. The right side seemed to be more pallid than the left, though this might be imaginary. Dissecting out the carotid from its origin at the innominata to its entrance into the skull we found a firm clot at the point of the ligation, extending one-half inch below and one and three-fourths inches above the ligature. The internal carotid was completely filled with a firm fibrinous clot as far as the entrance of the skull, so that in no event could hæmorrhage have taken place. The jaw was a mass of putrilage and pus had followed down the sheath of the common trunk, bathing all the parts to a full inch below the ligation and dissecting out the descendens noni nerve." In addition to the history of the case Surgeon Woodward has contributed a wet preparation of the ligated artery (*Spec.* 2018), a representation of which appears in the adjoining wood-cut (FIG. 420).

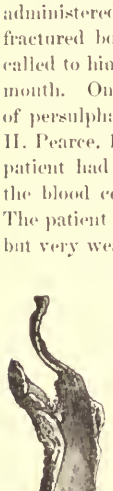

FIG. 420.—Right common carotid ligated 1½ inches below bifurcation. *Spec.* 2018.

Reviewing the above case Surgeon Woodward remarks: "Here was a case in which, according to Guthrie,[2] the internal carotid should have been ligated in the back of the throat. If allowed to differ from so great an authority, I say it could not have been done.

[1] Professor D. HAYES AGNEW (*The Principles and Practice of Surgery*, Philadelphia, 1878, Vol. I, p. 630) states that "during the War of the Rebellion there were 116 ligations of the common carotid for wounds of the face and the neck, 81 of which died," and gives as his authority the *Surgical History of the War*, Part I. The eminent professor evidently overlooked the fact that the cases given in detail are also included in the tabular statements. On page 423 of the *First Surgical Volume* the number of ligations of the common carotid, as then ascertained, was stated to be 75. On page 456 of the same volume another case was subsequently added, making a total of 76 cases. Since then 6 additional cases have been found, making a total of 82.

[2] GUTHRIE, (G. J.), *Commentaries*, London, 1855, Sixth Edition, p. 253.

In the first place, the jaw was shattered, pieces of which had been removed before he came to this hospital [Tullahoma]. The face and neck were enormously swelled, and a large quantity of flowing pus from a great suppurating surface blinded every view of the parts. Again, when the hæmorrhage came on, it was in such a torrent that there was no time for a nice dissection, such as Guthrie advises in his theoretical operation."

CASE 1105.—Corporal J. Quick, Co. G, 38th New York, aged 21 years, was wounded in the face, at the battle of Fredericksburg, December 13, 1862, a ball passing behind the left condyle of the lower jaw and making its exit on the left side of the nose. The wounded man was admitted to Eckington Hospital, at Washington, five days after receiving his injury, his face being very much swollen on the left side and the left eye being closed but uninjured. The treatment consisted of rest, aperients, low diet, and lead-wash locally. No fever ensued, the swelling abated, and the patient did very well until December 25th, when secondary hæmorrhage occurred at 4 P. M. The blood gushed from his mouth and left nostril, amounting to a quart in a few minutes. Acting Assistant Surgeon H. N. Fisher, assisted by Acting Assistant Surgeon A. Edelin, quickly plugged the nares with bits of muslin strung on threads and thrust into the nostril, which promptly stopped the hæmorrhage. It occurred again, however, and was controlled by thrusting in more of the tampon. The patient slept pretty well all night, being carefully watched and having his head well elevated. At 10 A. M. on December 26th he commenced bleeding again, the blood spouting from the wound at the side of the nose. A compress then applied over the orifice, and snugly bandaged, controlled the hæmorrhage. On the morning of the following day the patient had another free attack of hæmorrhage, but it was promptly checked by increased pressure on the compress, after which, on consultation, it was determined to tie the common carotid artery. Acting Assistant Surgeon Fisher accordingly ligated that vessel just above the omo-hyoid muscle, the patient not being etherized. The plugs were then removed from the nostril and the compress from the face, and no hæmorrhage recurred. The patient was put to bed, and the face and fresh wound were dressed with cold water. With the aid of an anodyne the patient slept well during the following night. The next morning his pulse was 120, a very slight pulsation being detected in the left temporal artery and that side of the head preserving its warmth. He was now also afflicted with diarrhœa, the discharges being thin and light colored. Beef tea and stimulants were ordered. On December 30th the pulse had increased to 150; patient's mind wandering; very restless; diarrhœa still continuing. Opium pills were now prescribed and the stimulants continued. On January 2, 1863, the patient was quite insensible, but gave answers when aroused; diarrhœa still continuing; stools frequent and involuntary; skin cold; pulse 140 and weak; wound looking sunken and glassy. In addition to opiates vegetable astringents were now ordered. Being unable to swallow solids and feeling choked by swallowing liquids, he was ordered oysters, which he ate greedily and swallowed readily. On January 4th the patient was still in a stupor; skin cold; pulse 146; some little redness about wound of face; wound of neck suppurating. In the afternoon a sanious discharge came on from the place of operation, giving reason to fear hæmorrhage from the artery. The oozing from the neck continued, and the patient's condition was about the same on the following day until 2.30 P. M., when the attending surgeon was called in haste and found that the carotid had given way and the blood was gushing per saltum from the wound. Death supervened in a few minutes. At the post-mortem examination the artery was found to have ulcerated through anteriorly where the ligature was applied. No attempt at union of the inner coats of the vessel was discovered, and no fibrinous deposit was found on the cardiac side, it having doubtless been forced out by the hæmorrhage. The distal side was, however, occupied by a plug extending up to the bifurcation of the vessel. The history of the case, together with the injured portion of the ligated artery (*Spec.* 898), represented in the annexed cut (FIG. 421), was contributed to the Museum by the operator.

FIG. 421.—Left common carotid; ulceration of artery without formation of clot. *Spec.* 898.

TABLE CXXVI.

Condensed Summary of Eighty-two Cases of Ligations of the Common Carotid for Shot Injuries.

[Recoveries, 1—19; Deaths, 20—82.]

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF HÆMORRHAGE.	PROBABLE SOURCE OF HÆMORRHAGE.	DATE OF OPERATION.	OPERATION, OPERATOR.	RESULT.
1	Ames, J. F., Pt., G, 91st N. Y., age 24.	Mar. 31, 1865.	Fracture left nasal and superior maxillary bones.	Apr. 5, 1865.	Branch of internal maxillary artery.	Apr. 5, 1865.	Left; in upper 3d, in cont. Surg. T. R. Crosby, U.S.V.	Discharged July 3, 1865.
2	Andrews, W. C., Pt., A, 30th Iowa, age 19.	Dec. 28, 1862.	Shell wound left temporal region.	Jan. 18, 1863.	Middle meningeal artery.	Jan. 18, 1863.	Left; in continuity. Ass't Surg. C. T. Alexander, U. S. A.	Discharged May 28, 1863.
3	Beamenderfer, C. W., Pt., A, 84th Pa., age 20.	May 6, 1864.	Fracture left lower maxilla; excision.	May 12, 1864.	Carotid artery....	May 12, 1864.	Left; in continuity, just above clavicle.	Discharged Nov. 29, 1864.
4	*Beard, J. J.*, Lieut., B, 19th Va. Cav., age 28.	Aug. 13, 1864.	Fracture of inferior maxilla.	Aug. 21, Sept. 4, 1864.	Common carotid...	Sept. 4, 1864.	——; in continuity. Surg. W. S. Love, P. A. C. S.	Recovered.
5	Brooks, J., Pt., I, 57th Pa., age 17.	May 6, 1864.	Fracture left temporal bone.	June —, 1864.	Temporal artery; June 18, lig. temp.	June 20, 1864.	Left; in continuity. Surg. T. R. Crosby, U. S. V. Aug. 15, re-ligation below omo-hyoid.	Discharged June 8, 1865.
6	Cox, D., Pt., F, 15th Indiana, age 25.	Nov. 25, 1863.	Fracture left lower maxilla.	Nov. 25, 1863.	Sublingual artery.	Nov. 29, 1863.	Left; in continuity. Surg. A. McMahon, U. S. V.	December 3, left carotid ligated. Discharg. June 25, 1864.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
7	Fugleson, C., Serg't, E, 4th Ohio, age 35.	May 12, 1864.	Flesh wound of lower jaw.	June 25, 1864.	—— ligation facial artery.	July 1, 1864.	Right; in continuity. Surg. D. W. Bliss, U. S. V.	Discharged October 27, 1864.
8	Hayden, J. S., Pt., D, 2d Iowa.	Feb. 14, 1862.	Fracture temporal bone.	Mar. 8, 1862.	.....	Mar. 22, 1862.	Left; in cont. Surg. J. Moore, U. S. A.	Discharged July 23, 1862.
9	Higgins, P., Pt., K, 56th New York	May 31, 1862.	Fracture lower jaw..	May 31, 1862.	Sublingual artery .	May 31, 1862.	Right; in continuity. Surg. Z. E. Bliss, U. S. V.	Discharged Sept. 21, 1862.
10	Klingenberg, C., Pt., F, 7th New York Artillery.	June 3, 1864.	Fracture lower jaw..	June 9, 1864.	.....	June 9, 1864.	Right; in continuity. Surg. D. P. Smith, U. S. V.	Discharged Feb. 20, 1865.
11	Maley, T. E., Lieut., 5th Cavalry, age 29.	July 28, 1864.	Fract. bones of face .	Aug. 18, 1864.	Internal maxillary artery.	Aug. 24, 1864.	Right; in continuity. Surg. A. B. Mott, U. S. V.	Retired December 15, 1870.
12	Merchant, G. B., Serg't, K, 4th Ohio, age 33.	May 10, 1864.	Fract. inferior maxilla.	May 15, 1864.	Internal maxillary artery.	May 15, 1864.	Right; in continuity. Ass't Surgeon W. Thomson, U. S. A.	Returned to duty June 19, 1864.
13	Murray, J. L., Pt., B, 42d N. Y., age 32.	Oct. 14, 1863.	Fract. inferior maxilla.	Oct. 25, 1863.	.....	Oct. 25, 1863.	Right; in continuity. Surg. E. Bentley, U. S. V.	Discharged Feb. 13, 1864.
14	Plasket, J., Pt., A, 120th New York.	Sept. 9, 1864.	Fracture of bones of face.	Sept. 9, 1864.	.....	Sept. 9, 1864.	Carotid; in continuity. Surg. W. B. Reynolds, 2d U. S. S. S.	Transfer'd to V. R. C. May 4, 1865.
15	Reed, J. K. P., Serg't, D, 13th Mass.	Sept. 17, 1862.	Fracture of bones of face, right side.	.....	.....	Sept. 28, 1862.	In continuity	Discharged Nov. 14, 1862.
16	Salmon, G. E., Pt., I, 207th Pa., age 26.	Apr. 2, 1865.	Fracture right inferior maxilla.	Apr. 10, 1865.	Right common carotid.	Apr. 11, 1865.	Right; in continuity.	Discharged May 18, 1865.
17	Sandy, N. B., Pt., G, 3d W. Va., age 19.	Aug. 30, 1862.	Fracture left inferior maxilla.	Sept. 6, 1862.	Through mouth ..	Sept. 6, 1862.	Right; in continuity. Ass't Surg. P. Adolphus, U. S. A.	Discharged October 10, 1862.
18	Shockey, D., Pt., I, 101st Ind., age 22.	Sept. 19, 1863.	Fracture left lower jaw.	Sept. 25, 1863.	Hæm. recur. Sept. 30, Oct. 6, 9, 10.	Oct. 14, 1863.	Left; in continuity. Confederate surg.	Discharged June 24, 1865.
19	Siggins, T., Lieut., 49th Mass.	May 27, 1863.	Fracture maxillary bones.	May 31, 1863.	.....	June 16, 1863.	Left; in cont. Ass't Surg. F. C. Greene, 30th Mass.	Recovered.
20	*Ashley, J. J.*, citizen, age 63.	Oct. 16, 1864.	Wound of left ear, sloughing.	Oct. 29, 1864.	Temporal artery ..	Oct. 29, 1864.	Left; in cont. A. A. Surg. N. A. Robbins.	Died November 2, 1864.
21	*Bachus, J. W.*, Pt., A, 12th Ga. Batt'y, age 20.	July 9, 1864.	Fracture right inferior maxilla.	July 20, 1864.	Facial artery.....	July 25, 1864.	Right; in cont. Ass't Surg. R. F. Weir, U. S. A. Aneurism; relig. above and below aneurism, Aug. 30.	Died September 1, 1864.
22	Baine, H., Pt., C, 188th Pa., age 19.	June 3, 1864.	Wound left side of face.	June 15, 1864.	Internal maxillary artery.	June 16, 1864.	Left; in continuity. Surg. N. R. Moseley, U. S. V.	Died June 26, 1864; exhaustion.
23	Beare, J., Pt., G, 11th Pa., age 34.	May 10, 1864.	Injury com. carotid artery and external jugular vein.	May 10, 1864.	Common carotid ..	May 15, 1864.	Left; in cont. and ext. jug. vein. Surg. E. Bentley, U. S. V.	Died May 21, 1864; pyæmia.
24	Bowles, G. W., Serg't, I, 42d Pa., age 25.	July 3, 1863.	Fract. inferior maxilla.	July 9, 1863.	External carotid ..	July 10, 1863.	In continuity.....	Died July 13, 1863. *Specs.* 3969, 3902.
25	Boyts, H., Pt., A, 142d Pa., age 18.	Aug. 21, 1864.	Fracture left temporal region.	Aug. 26, 27, 1864.	.....	Aug. 27, 1864.	Left; in continuity..	Died Sept. 2, 1864. *Spec.* 3179.
26	Brown, G, Pt., I, 25th Mass., age 41.	Dec. 14, 1862.	Fract. malar, temp., and max. bones.	Jan. 7, 9, 1863.	External carotid...	Jan. 9, 1863.	Right; in continuity.	Died Jan. 18, 1863; exhaustion.
27	Burns, R., Pt., 10th Massachusetts.	May 31, 1862.	Wound of mouth and neck.	.. ...	.....	June 18, 1862.	In continuity; linguai also tied.	Died June 19, 1862; exhaustion.
28	Clark, J., Pt., H, 57th Pa., age 21.	Sept. 30, 1864.	Fracture right upper jaw.	Oct. 13, 1864.	External carotid...	Oct. 13, 1864.	Right; in continuity. A. A. Surg. J. H. Packard.	Died Oct. 22, 1864, of hæmorrhage.
29	*Copeland, W. R.*, Pt., B, 61st Ala., age 34.	Sept. 19, 1864.	Wound left side of face.	Oct. 7, 1864.	.....	Oct. 7, 1864.	Right; in continuity. Surg. W. S. Love, P. A. C. S.	Hæm. recurred; died Oct. 8, 1864.
30	*Creecy, B.*, Pt., F, 42d Va.	May 3, 1863.	Shot wound of larynx.	May 12, 1863.	.....	May 12, 1863.	Right; in continuity. Surg. R. Murdock, P. A. C. S.	May 15, left; in cont. Died May 20, 1863.
31	Cronin, M., Pt., F, 95th N. Y., age 19.	June 19, 1864.	Wound right side of face.	July 1, 1864.	Internal maxillary artery.	July 4, 1864.	Right; in continuity; religated July 6.	Died July 6, 1864; hæmorrhage.
32	Darnaby, E., Pt., H, 1st Maine Cav., age 19.	Apr. 12, 1865.	Ball entered below ang. jaw; carotid artery wound.	.....	External carotid ..	.....	In continuity. Acting Staff Surgeon N. F. Graham.	Died May 5, 1865, of hæmorrhage.
33	Deibold, C., Lieut., D, 82d Ohio.	May 8, 1862.	Shot wound of neck	May 23, 1862.	External carotid sloughed.	May 24, 1862.	In continuity. Surg. J. Y. Cantwell, 82d Ohio	Died June 19, 1862.
34	Dougherty, J., Sergeant, B, 69th N. Y., age 23.	May 13, 1864.	Fracture right parietal.	May 16, 1864.	Middle meningeal artery.	May 16, 1864.	Right; in continuity. Surg. E. Bentley, U. S. V.	Died May 26, 1864, of exhaustion.
35	Felix. W., Pt., H, 9th W. Va., age 18.	Aug. 25, 1864.	Fracture right lower jaw.	Sept. 3, 1864.	Lingual artery	Sept. 3, 1864.	Left; in continuity. Ass't Surg. R. F. Weir, U. S. A.	Died Sept. 4, 1864, of hæmorrhage.
36	Fisher, W., Lieut., H, 99th Pa.	Oct. 7, 1864.	Facial and carotid arteries severed.	.....	Facial and carotid arteries.	Oct. 9, 1864.	Left; in continuity. Surg. W. B. Reynolds, 2d U. S. S. S.	Died Oct. 10, 1864.
37	Fonderan, A., Serg't, D, 11th Indiana, age 25.	June 24, 1863.	Fracture lower jaw, right side.	July 7, 1863.	.....	July 8, 1863.	Right; in continuity; religated at bifurc. ext. and int. car.; inc. in ligature.	Died July 10, 1863, from exhaustion. *Specs.* 1635, 1636.
38	*Gardner, J. B.*, Pt., F, 5th Louisiana.	Feb. 7, 1865.	Ball entered anterior to left ear.	Feb. 17, 1865.	Recur. 20th, 21st, and 22d.	Feb. 22, 1865.	Left; in continuity. Surg. W. F. Richardson, P. A. C. S.	Died Feb. 22, 1865.
39	*Guthrie, W. T.*, Pt., F, 38th Va., age 30.	May 16, 1864.	Wound of face.....	June 19, 22, 1864.	Superior maxillary	June 23, 1864.	Left; in continuity..	Died June 25, 1864; exhaustion.
40	Harrington, M., Pt., L, 21st N. Y. Cav., age 19.	July 24, 1864.	Wound through neck	Aug. 9, 1864.	.....	Aug. 10, 1864.	Left; in continuity. Surg. J. B. Lewis, U. S. V. Aug. 14, lig. right com. car.	Died Aug. 19, 1864.
41	Heiser, J., Corp'l, I, 53d Pa., age 27.	Aug. 14, 1864.	Shot wound of face..	Aug. 24, 25, 1864.	Inferior maxillary artery.	Aug. 25, 1864.	In cont. Surg. N. R. Moseley, U. S. V.	Died Aug. 30, 1864; exhaustion.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
42	Herman, H., Pt., I, 12th Pa. Res., age 23.	Sept. 17, 1862.	Wound of neck; ball lodged in spinal cord.	Sept. 29, 1862.	Carotid artery; aneurism.	Sept. 30, 1862.	Right; both ends in wound. A. Surg. R. F. Weir, U. S. A.	Died Oct. 1, 1862.
43	*Houston, J. C.*, Pt., D, 2d Ala., age 18.	Apr. 9, 1865.	Fracture right malar bone.	May 6, 7, 1865.	Branches external carotid.	May 7, 1865.	Left; in continuity. Surg. A. McMahon, U. S. V.	Hæm. recurred; died May 26, 1865.
44	*Hughes, D. C.*, Pt., F, 11th Virginia.	May —, 1862.	Wound of neck.....	.....	.....	.....	Left; in cont. May 17, lig. of right com. carotid.	Died May 17, 1862.
45	Hutchins, H., Pt., I, 25th Ohio, age 25.	Dec. 9, 1864.	Fracture inf. maxilla.	Dec. 18, 1864.	Lingual artery	Dec. 18, 1864.	In cont. A. A. Surg. S. Hendrickson.	Died Dec. 27, 1864; hæmorrhage.
46	*Hutts, M.*, Pt., C. S. A., age 35.	.....	Fracture lower jaw ..	June 7, 1863.	.....	June 7, 1863.	Right; in continuity	Died June 8, 1863.
47	Jones, E., Pt., D, 29th Iowa.	July 4, 1863	Fracture left inferior maxilla.	July 18, 1863.	Brach., facial, and lingual arteries.	July 18, 1863.	Left; in continuity ..	Hæm. recurred; died July 26, 1863.
48	*Jones, J. P.*, Pt., E, 21st Miss., age 30.	May 3, 1863.	Fracture left superior maxilla.	June 3, 1863.	Slough. rec. 5, 6, 7.	June 7, 1863.	In continuity	Died June 7, 1863; exhaustion.
49	Jungk, J. G., Serg't, F, 46th N. Y., age 30.	Sept. 30, 1864.	Fracture right upper jaw.	Oct. 7, 1864.	External carotid artery.	Oct. 7, 1864.	Right; in cont. A. A. Surg. G. A. Chesley.	Died Oct. 12, 1864, of hæmorrhage.
50	Keitlin, V. L., Serg't, K, 105th Pa.	July 2, 1863.	Fracture right arch of atlas.	July 12, 1863.	Internal carotid ...	July 13, 1863.	Right, in continuity. Surg. H. Palmer, U. S. V.	Died July 14, 1863.
51	Kenrick, A. F., Pt., A, 16th Ky., age 24.	June 2, 1864.	Wound of face	June 17, 1864.	Recurred 18th and 19th.	June 19, 1864.	Left; in continuity ..	Died June 22, 1864.
52	Kilburn, D. W., Pt., I, 1st Maine, age 22.	May 19, 1864.	Wound of face and neck.	May 29, 1864.	Facial and exterior carotid arteries.	May 29, 1864.	Right; in cont. A. A. Surg. J. C. Nelson.	Died June 2 1864, of asphyxia.
53	Klink, N., Pt., K, 95th Pa., age 26.	May 3, 1863.	Wound right side of face.	May 14, 1863.	.....	May 16, 1863.	Right; in continuity.	Died May 20, 1863.
54	*Lilley, E. F.*, Pt., G, 8th Texas, age 24.	May 9, 1864.	Wound of face.....	May 16, 1864.	.....	May 16, 1864.	Right; in continuity	Died May 16, 1864.
55	*McGuire, J. H.*, Pt., K, 24th Miss.	Sept. 26, 1863.	Fracture left mastoid process.	.....	.....	Oct. 10, 1863.	Left; in continuity..	Died Oct. 24, 1863.
56	McIlroy, J. P., Pt., C, 45th Pa.	June 3, 1864.	Fract. inf. maxilla; int. max. art. inj.	.....	.....	June 18, 1864.	In cont. A. A. Surg. J. H. York.	Died June 19, 1864; hæmorrhage.
57	McInnis, S., Pt., A, 11th Illinois, age 27.	May 22, 1863.	Fracture lower jaw; right side.	May 31, 1863.	External carotid ..	May 31, 1863.	In cont. Surg. E. M. Powers, 7th Mo.	Died June 7, 1863.
58	McIntosh, T., Pt.. A, 40th Ind., age 18.	Nov. 25, 1863.	Fract. frontal bone..	Dec. 16, 17, 1863.	.....	Dec. 16, 1863.	Right; in continuity.	Died Dec. 19, 1863; exhaustion.
59	McKenney, E., Pt., 6th Pa. Cav., age 26.	Jan. 1, 1863.	Wound through left side neck.	Jan. 1, 1863.	Aneurism	Feb. 26, 1863.	Left; in cont. Ass't Surg. R. F. Weir, U. S. A.	Died April 6, 1863.
60	Martin, T. B., Pt., E, 96th Ill.	Sept. 20, 1863.	Fract. orbital plate and nasal bones.	Oct. 8, 1863.	Ophthalmic artery; hæmorrhages Oct. 23 and Nov. 7, 10.	Nov. 11, 1863.	Right; in cont. A. A. Surg. J. H. Coover.	Died Dec. 19, 1863.
61	Messenger, P. B., Sergeant, A, 111th Pa.	Nov. 24, 1863.	Fracture right lower jaw.	Dec. 3, 1863.	Internal carotid...	Dec. 3, 1863.	Right; both ends in wound. Assistant Surgeon H. Pearce, 150th N. Y.	Died Dec. 8, '63. *Spec.* 2018, A. M. M.
62	Moore, J. G., Corp'l. B. 110th Pa., age 20.	Feb. 6, 1865.	Wound left side of head.	Feb. 15, 1865.	Internal carotid...	Feb. 15, 1865.	Left; in continuity. Feb. 21, religated.	Died Feb. 25, 1865.
63	O'Connor, P., Pt., H, 18th Inf.	Sept. 20, 1863.	Fracture left inferior maxilla.	Oct. 2, 1863.	Facial art.; Oct. 4, ligature ext. carotid. Surg. P. H. Cleary, U. S. V.	Oct. 23, 1863.	Right; in continuity. Surg. I. Moses, U. S. V.	Died Oct. 25, 1863, of exhaustion. *Spec.* 2133.
64	Peckham, A. J., Corporal, I, 115th N. Y., age 30.	June 2, 1864.	Fracture cranium ...	.....	.....	June 8, 1864.	Right; in continuity. Surg. E. Bentley, U. S. V.	Died June 13, 1864; exhaustion from continued hæm.
65	Phillips, G., Corp'l, H, 91st Pa., age 28.	Oct. 27, 1864.	Left inferior maxilla.	Nov. 4, 6, 1864.	Lingual	Nov. 6, 1864.	Left; in continuity. Surg. N. R. Moseley, U. S. V.	Died Nov. 18, 1864, of exhaustion. *Spec.* 3409.
66	Pyle, L. A., Serg't, A, 8th N. Y. Art., age 21.	Aug. 25, 1864.	Ball impinged on temporal bone.	Sept. 7, 9, 1864.	Post. auricular artery.	Sept. 9, 1864.	Right; in continuity. A. A. Surgeon W. W. Valk.	Died Sept. 20, 1864; hæmorrhage. *Spec.* 3252.
67	Quick, J., Corp'l, G, 38th N. Y., age 21.	Dec. 13, 1862.	Fracture left lower jaw.	Dec. 25, 1862.	Recurred 26th and 27th.	Dec. 27, 1862.	Left; in cont. A. A. Surg. H. N. Fisher.	Died January 6, 1863. *Spec.* 858, A. M. M.
68	Reeves, W., Pt., C, 76th N. Y., age 22.	May 6, 1864.	Fracture of inferior maxilla.	May 12, 1864.	Lingual and inf. dental arteries.	May 12, 1864.	Left; in cont. A. Surg. G. A. Marsick, U. S. V.	Died May 13, 1864; exhaustion.
69	Ritigan, J., Pt., B, 63d N. Y., age 30.	May 6, 1864.	Fracture of inferior maxilla.	May 14, 1864.	Carotid artery	May 31, 1864.	Right; in continuity. Surg. G. L. Pancoast, U. S. V.	Died June 1, 1864; prostration. *Specs.* 2481, 2482, A. M. M.
70	*Robinson, J. W.*, Captain, C, 27th Georgia, age 21.	June 19, 1864.	Wound left side of neck.	June 19, 1864.	Internal carotid...	June 19, 1864.	Left; in cont. July 3, relig. below omohyoid.	Died July 5, 1864.
71	*Rollin, J. N.*, Pt., I, 1st N. Carolina, age 28.	Oct. 19, 1864.	Ball entered back of neck; fracture vertebra.	Oct. —, 1864.	....	Nov. 9, 1864.	In cont. A. A. Surg. G. G. Brewer.	Died Nov. 9, 1864; exhaustion.
72	Schenck, W., Pt., F, 119th N. York, age 18.	June 15, 1864.	Fracture sup. maxilla.	July 6, 1864.	Superior maxillary artery.	July 10, 1864.	In cont. A. A. Surg. D. J. Griffiths.	Died July 24, 1864; exhaustion.
73	Schlicher, J., Corp'l, C, 20th Mass., age 33.	July 1, 1863.	Fracture left superior maxilla.	July 8, 1863.	Recurred 10th and 16th.	July 16, 1863.	Left; in cont. A. A. Surg. W. W. Keen.	Died Aug. 23, 1863. *Spec.* 4428, A. M. M.
74	Sheppard, P., Pt., K, 42d Indiana, age 34.	Aug. 1, 1864.	Fracture nasal, malar, and inf. maxillary bones.	Aug. 29, 1864.	Internal maxillary artery.	Aug. 30, 1864.	Right; in continuity. Surg. B. B. Breed, U. S. V.	Died Aug. 30, 1864; hæmorrhage.
75	*Smith, W. W.*, C. S. A.	May 5, 1864.	Wound of head and neck.	May 12, 1864.	.....	May 21, 1864.	In continuity	Died May 22, 1864.
76	Spacht, M., Pt., D, 52d Pennsylvania.	May 31, 1862.	Fracture sup. maxilla.	June 13, 14, 1862.	....	June 14, 1862.	Left; in cont. A. A. Surg. D. W. Cheever.	Died June 24, 1862. *Spec.* 508, A. M. M.
77	Stienberger, S., Pt., 1st Cavalry.	May 5. 1862.	Fracture lower jaw and 3d cervical vertebra.	May 13, 1862.	Vertebral artery.	May 16, 1862.	In cont. Surg. R. B. Bontecou, U. S. V.	Died May 23, 1862; hæmorrhage.
78	Theilman, H., Pt., K, 15th New York Artillery. age 37.	June 19, 1864.	Wound left side face; fracture.	.....	.....	July 6, 1864.	Left; in cont. A. A. Surg. O. W. Peck.	Died July 12, 1864; exhaustion.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
79	Thomas, G., Pt., C, 82d Pa., age 22.	May 10, 1864.	Fracture infer'r and superior maxillæ.	June 2, 1864.	Internal maxillary	June 2, 1864.	Left; in cont. A. Surg. W. Thomson, U. S. A. Int. jug. vein also tied.	Died June 3, 1864. *Spec.* 3542, A. M. M.
80	Trabey, H., Pt., I, 5th Pa. Cav., age 26.	May 8, 1864.	Shot-wound of face.	June 26, 1864.	Facial artery.....	June 27, 1864.	In cont. A. Surg. W. Webster, U. S. A.	Died July 5, 1864.
81	Ward, P. H., Pt., B, 24th Wisconsin.	Dec. 30, 1862.	Fracture inf. maxilla.	.....	Inferior maxillary artery.	Jan. —, 1863.	Right; in continuity.	Died Jan. 15, 1863.
82	Winter, F., Pt., A, 3d Illinois Cav., age 24.	Aug. 21, 1864.	Fracture upper and lower jaws.	Sept. 4, 1864.	Internal maxillary artery.	Sept. 6, 1864.	Left; in cont. A. A. Surg. J. Z. Hall.	Died Sept. 7, 1864; exhaustion.

Ligations of the Internal Carotid Artery.—Instances of this operation are rare,[1] and no cases were reported by the medical officers of the Union army.

Ligations of the External Carotid.—Of seven cases, four recovered and three were fatal. The bleedings were from the internal maxillary in two, from the carotid in four instances; in one case the source of the hæmorrhage was not indicated.

Table CXXVII.

Condensed Summary of Seven Cases of Ligations of the External Carotid Artery for Shot Injuries.

[Recoveries, 1—4; Deaths, 5—7.]

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
1	Bryant, W., Pt., B, 17th Indiana.	June 25, 1863.	Fract. left malar and maxillary bones.	July 5, 8, '63.	External carotid ..	July 8, 1863.	One end in wound...	Returned to duty June 11, 1864.
2	Diss, C. A., Pt., D, 30th Ohio.	Sept. 14, 1862.	Fract. superior maxilla.	Sept. 22, 1862.	Internal maxillary and carotid.	Sept. 22, 1862.	In cont. Surg. H. S. Hewit, U. S. V.	Discharged Nov. 24, 1862.
3	Henderson, G., Serg., F, 7th Wisconsin.	Sept. 14, 1862.	Fract. inferior maxilla.	Sept. 15, 1862.	External carotid ..	Sept. 15, 1862.	In continuity.....	Discharged Oct. 25, 1862.
4	*Thompson, L. C.*, Pt., S, 1st Texas, age 26.	Dec. 14, 1864.	Fract. inferior maxilla.	Dec. 14, 1864.	Internal maxillary.	Dec. 14, 1864.	In cont. Surg. J. C. Jones, 4th Texas.	Recovered June 14, 1865.
5	Godfrey, A., Pt., H, 14th N. Y. Art'y, age 16.	June 18, 1864.	Wound of external carotid.	June 27, 1864.	External carotid ..	June 27, 1864.	Both ends in wound. Surgeon G. L. Pancoast, U. S. V.	Died June 30, 1864.
6	*Nelson, G. W.*, Pt., K, 12th Georgia.	June 6, 1864.	Fracture of zygoma.	June 7, 1864.	Internal maxillary.	June 7, 1864.	In continuity	Died June 19, 1864.
7	Whitney, F. L., Pt., D, 36th Massachusetts, age 24.	June 3, 1864.	Fract. right orb. and zygomatic arch.	June 15, 1864.	.....	June 16, 1864.	In continuity. A. A. Surg. W. H. Ensign.	Died June 16, 1864, of exhaustion.

Thirty-five examples of ligations of minor branches of the external carotid were reported. They comprise one ligation of the superior thyroid, one of the lingual, five of the occipital,

[1] On the Confederate side a case is related by Dr. W. H. BRAMLETTE. It will be found on page 194 of the *Medical Record*, New York, 1869–70, Vol. IV: Captain *H*——, 5th Georgia State Reserves, aged 47, was wounded December 10, 1864, by a minié ball, which comminuted the malar bone, and ranging backward, impinged against the base and inner border of the mastoid process, passing out at back of neck. He was sent to a hospital at Macon, where the fractured bone was removed; secondary hæmorrhage occurred on the tenth day from wound of entrance, which was controlled by pressure on common carotid until the arrival of the surgeons. The ordinary incision was made and the internal carotid ligated, as was believed, about three-fourths of an inch above the bifurcation; hæmorrhage from wound ceased; ligature came away on 14th day without hæmorrhage. On the following day an alarming hæmorrhage recurred from a small opening in the line of the incision of the neck; the common carotid was then ligated below the omo-hyoid muscle; hæmorrhage continuing through the reflow of the blood through the external carotid, the latter was ligated, as also the superior thyroid. The ligatures separated and came away without hæmorrhage—that of the common carotid about the 18th day; but a few hours afterwards hæmorrhage recurred while straining at stool. This time the hæmorrhage was arrested by styptics and pressure. No further hæmorrhages occurred. The wounds healed in three weeks, and the patient was furloughed and went home. Since the war a case in which ligatures were placed around the internal as well as the external and common carotid for shot injury is reported by W. U. BYRD (*Ligation of the Common, External, and Internal Carotid Arteries for Gunshot Injury—Death*, in *New York Medical Journal*, 1876, Vol. XXIV, p. 174): A policeman, shot by thieves at Quincy, Illinois, May 29, 1876. Wounds of lip, chin, and fracture of jaw; ball split in three pieces, one of which split the external carotid artery, with the point impinging upon and entering the left internal carotid a half inch above the division of the left common carotid. Profuse hæmorrhage. May 30, 1876, common carotid ligated just below bifurcation, and internal and external carotids just above points of injury; died 20 minutes after operation. The first ligation of the internal carotid seems to have been performed by KEITH, in 1850, who, while removing a foreign body, accidentally cut the internal carotid: KEITH (W.) (*Case of Wound of the Internal Carotid Artery, inflicted while operating from within the Mouth for the removal of a foreign body deep in the Neck—Ligature of the Internal Carotid—Hæmorrhage controlled by a Single Ligature, and Cure*, in *The Monthly Journal of Medical Science*, Edinburgh, 1851, Vol. XII, p. 435). Two operations for punctured wounds, and one after disarticulation of the lower jaw for malignant tumor, have been reported by: LEWIS (M.), *Double Ligation of the Internal Carotid Artery in* 1869, *by* Dr. A. T. LEE, *deceased, formerly of Kingston, Tenn.*, in *Am. Jour. Med. Sci.*, 1879, Vol. LXXVII, p. 142. BRIGGS (W. T.), *Traumatic Aneurism of the Internal Carotid Artery, the result of a Puncture—Ligation of the Internal Carotid at the seat of the Injury*, in *Nashville Journal of Med. and Surgery*, 1874, Vol. XIII, p. 119. SANDS (H. B.), *A Case of Hæmorrhage from the Internal Carotid Artery treated successfully by the Ligature*, in *New York Medical Journal*, 1874, Vol. XIX, p. 34.

one of the auricular, eighteen of the temporal, eight of the facial, and one of the submental arteries. The results are indicated in TABLE CXXV, on page 765.

Ligation of Superior Thyroid.—CASE 1107.—Private G. Atwood, Co. H, 142d New York; shot injury of inferior maxillary region, October 27, 1864. Hæmorrhage occurred from branch of superior thyroid November 7, 1864. Ligation of both ends in wound November 7, 1864. Discharged April 19, 1865.

Ligation of Lingual Artery.—CASE 1108.—Private P. Everson, B, 1st Minnesota; shot through base of tongue; jaw fractured, July 2, 1863. Hæmorrhage from both linguals occurred July 14th; both arteries tied *en masse* in wound on the same day. Discharged June 12, 1864; unable to eat other than liquid food.

Ligations of Occipital Artery.—CASES 1109-1113.—Private *L. C. Adzer*, K, 9th Louisiana, aged 20, wounded at Monocacy Junction July 9, 1864; shot penetration of neck; occipital artery severed; July 19, hæmorrhage, 16 ounces, from occipital; both ends of artery ligated in wound by Surgeon C. H. Todd, C. S. A.; recovery.—Sergeant D. Holliday, B, 26th Pennsylvania; flesh wound of neck, July 2, 1863; hæmorrhage, 32 ounces, occurred July 25; both ends ligated in wound on the same day; hæmorrhage recurred on the 27th, but ceased spontaneously; duty May 3, 1864.—Private R. Norris, C, 1st Cavalry, wound of right side of head and neck, May 8, 1864; May 19, hæmorrhage from occipital; May 25, 1864, ligation by A. A. Surgeon F. G. H. Bradford; discharged July 25, 1864.—Private D. H. Roberts, E, 118th New York; wounded October 17, 1864; fracture of external table of occipital bone; November 7, hæmorrhage from occipital; ligation, both ends in wound, on same day; discharged April 20, 1865.—Private J. Horton, D, 57th Massachusetts; wounded May 18, 1864; ball lodged in first dorsal vertebra; May 31, hæmorrhage from occipital; artery ligated in wound by Surgeon R. B. Bontecou, U. S. V.; hæmorrhage recurred; artery re-ligated June 2; death June 2, 1864.

Ligation of Auricular Artery.—CASE 1114.—Private C. Wagner, L, 1st New York Cavalry, aged 25 years; fracture of temporal bone by pistol ball June 26, 1865; ligation of posterior auricular on the same day by Surgeon D. W. Bliss, U. S. V. Discharged October 12, 1865.

Ligations of the Temporal Artery.—There were eighteen cases of ligations of the temporal artery; fourteen were successful and four were fatal; the hæmorrhages in fifteen instances were from the temporal, and in three from branches of this artery.

TABLE CXXVIII.

Condensed Summary of Eighteen Cases of Ligations of the Temporal Artery for Shot Injuries.

[Recoveries, 1—14; Deaths, 15—18.]

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF HÆMORRHAGE.	PROBABLE SOURCE OF HÆMORRHAGE.	DATE OF OPERATION.	OPERATION, OPERATOR.	RESULT.
1	Faucett, R., Pt., B, 8th Michigan, age 45.	May 6, 1864.	Fract. of right mastoid process.	May 19, 1864.	Small branch of right temporal.	May 19, 1864.	Prox. end in wound. Surg. I. I. Hayes, U. S. V.	Transferred to V. R. C. Jan. 23, 1865.
2	Fobes, J., Pt., L, 1st Vt. Cavalry, age 19.	June 24, 1864.	Scalp wound of forehead.	.....	.....	.....	Right	Retur'd to duty September 29, 1864.
3	Fuller, B., Pt., H, 7th Iowa.	Oct. 3, 1862.	Flesh wound; temporal artery severed.	.....	.....	.....	Right; ligated.....	Discharged January 13, 1863.
4	Gilmore, H., Lieut., A, 17th Vermont, age 32.	May 12, 1864.	Flesh wound of scalp.	May 21, 1864.	Temporal artery ..	May 21, 1864.	In continuity, by A. A. Surgeon F. W. Kelly.	Retur'd to duty September 6, 1864.
5	*Hartly, F. C.*, Pt., G, 49th Virginia.	May 31, 1864.	Wound of scalp....	.....	Branch of temporal.	June 5, 1864.	Ligated	Recovered .....
6	Jones, D., Pt., B, 1st Massachusetts, age 26.	May 6, 1864.	Wound of scalp	May 24, 1864.	Temporal artery ..	May 24, 1864.	Left; in cont., by A. A. Surg. S. D. Marshall.	Recovered .....
7	Kullman, H., Corp'l, I, 37th Wis., age 24.	July 30, 1864.	Wound of scalp and right ear.	Aug. 14, 1864.	Temporal artery ..	Aug. 14, 1864.	In cont., by Surg. R. B. Bontecou, U. S. V.	Mustered out May 30, 1865.
8	Miller, L., Pt., D, 46th New York, age 34.	June 30, 1864.	Fracture of parietal, temp., and frontal.	July 28, 1864.	Temporal	July 28, 1864.	Left; ligated	Discharged July 25, 1865.
9	Mullen, J., Pt., A, 100th Pennsylvania.	Nov. 30, 1863.	Wound of scalp; temporal art'y severed.	Nov. 30, 1863.	Temporal	Nov. 30, 1863.	In cont., by Surg. G. B. Coggswell, 29th Massachusetts.	Returned to duty.
10	Reese, H., Pt., I, 53d Pa., age 18.	July 2, 1863.	Flesh wound of scalp; right.	July 13, 1863.	Temporal	July 13, 1863.	One end in wound...	Retur'd to duty Dec. 7, 1863.
11	Smith, A. H. C., Lt., E, 12th N. H.	June 3, 1864.	Scalp wound; temporal artery severed.	June 3, 1864.	Temporal	June 3, 1864.	Ligated.	Discharged June 21, 1865.
12	Talmadge, A. S., Corp'l, E, 11th New Jersey, age 32.	July 3, 1863.	Flesh wound of left temple.	July 14, 1863.	Temporal	July 14, 1863.	Ligated. Surg. I. I. Hayes, U. S. V.	Retur'd to duty Mar. 24, 1864.
13	Taylor, J. C., Corp'l, D, 5th N. J., age 44.	June 1, 1862.	Shot wound of scalp	June 4, 1862.	Temporal	June 4, 1862.	In continuity.....	Retur'd to duty Aug. 19, 1862.
14	Wheeler, W., Pt., B, 91st N. Y., age 37.	April 1, 1865.	Fracture of temporal bone; right side.	Apr. 22, 1865.	Temporal and posterior auricular.	Apr. 22, 1865.	One end in wound...	Discharged June 29, 1865.
15	Dunbar, R., Serg't, B, 19th Mass.	Oct. 14, 1863.	Fracture of left frontal eminence.	Nov. 6, 1863.	Temporal	Nov. 6, 1863.	In wound	Died November 29, 1863. *Spre.* 1951.
16	Jones, L., Pt., C, 115th N. Y., age 23.	Feb. 20, 1864.	Flesh wound of scalp	Feb. 27, 1864.	Anterior temporal	Feb. 27, 1864.	In wound	Died Oct. 15, 1864.
17	Newcomb, J. S., Pt., E, 50th New York.	Sept. 18, 1861.	Scalp wound; temporal artery torn.	Sept. 18, 1861.	Temporal	Sept. 18, 1861.	In continuity	Died September 21, 1861.
18	Taylor, R. I., Pt., F, 1st Maine H. Art., age 25.	May 19, 1864.	Fracture of left temporal bone.	June 3, 1864.	Temporal	June 3, 1864.	Ligated	Died June 5, 1864.

Ligations of the Facial Artery.—Eight cases were reported; five of the patients recovered and three died—one from hæmorrhage, one from tetanus, and one from the severity of the injuries to the bones of the lower portion of the face.

TABLE CXXIX.

Condensed Summary of Eight Ligations of the Facial Artery for Shot Injuries.

[Recoveries, 1—5; Deaths, 6—8.]

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
1	Bessel, A. J., Serg't 14th Michigan.	July 5, 1864.	Fracture of inferior maxilla.	.....	.....	.....	Facial ligated in continuity.	Discharged January 4, 1865.
2	Corwell, J., Pt., D, 4th Pa. Cavalry.	Oct. 18, 1861.	Fracture of left inferior maxilla.	Oct. 19, 1861.	Facial.....	Oct. 19, 1861.	Ligated	Discharged January 9, 1862.
3	Gaines, W., Pt., C, 5th Colored Troops, age 20.	June 18, 1864.	Fracture of superior and inferior maxilla.	June 25, 1864.	Facial artery.....	June 25, 1864.	In continuity. A. A. Surg. C. C. Ela.	Recovered.
4	McCray, J. A., Pt., 145th Pennsylvania.	May 12, 1864.	Fracture of lower jaw.	June 4, 1864.	Facial artery.....	June 4, 1864.	One end in wound...	Recovered.
5	Woodward, C. L., Pt., I, 2d Vt., age 19.	May 3, 1863.	Fracture of lower maxilla.	.....	.....	.....	Left; ligated in wound.	Returned to duty Feb. 19, 1864.
6	Dutton, A. H., Col. 21st Conn., age 25.	May 29, 1864.	Fracture of lower maxilla.	May 31, 1864.	Facial.....	June 2, 1864.	One end in wound...	Died June 4, 1864; tetanic symptoms.
7	Foot, B., Pt., I, 4th C. Troops, age 22.	June 15, 1864.	Fracture of superior maxilla.	June 15, 22, '64.	Ascending palatine artery.	June 23, 1864.	In continuity. A. A. Surg. C. C. Ela.	Died June 23, 1864, from hæmorrhage.
8	Parks, J. D., Pt., A, 29th Conn., age 30.	Oct. 27, 1864.	Fracture of body of inf. maxilla.	.....	.....	.....	Ligation of facial ...	Died November 6, 1864.

Ligation of Submental Artery.—CASE 1115.—Private J. Ketcham, Co. F, 5th Michigan, received at Gettysburg, July 2, 1863, a shot wound of left cheek, severing the submental artery. The vessel was tied on the field. The patient was returned to duty on December 5, 1863.

Ligations of the Subclavian Artery.—Fifty-one cases of ligations of the subclavian artery for shot injuries were reported, of which ten terminated in recovery. In ten cases the operations were performed for aneurism, either diffused or circumscribed. In seventeen instances amputation had been performed prior to the ligation—in seven cases at the shoulder joint, in ten in the arm. In the remaining twenty-four cases the bleeding was from the brachial in three, the posterior circumflex in one, the axillary in eight, the subscapular in one, and the subclavian in five instances; and in six cases the source of hæmorrhage was not indicated. In the following case, of which the specimen is preserved in the Army Medical Museum, the subclavian was ligated in its third portion after the arm had been amputated in the upper third:

CASE 1116.—Private S. R. Peterson, Co. D, 14th Infantry, aged 27 years, was wounded at Chancellorsville, May 3, 1863, and received into Second Division Hospital, Fifth Army Corps. Assistant Surgeon C. Wagner, U. S. A., noted: "Gunshot wound of arm. Amputation by B. Howard, Assistant Surgeon, U. S. A." From the field hospital the patient was, on June 14th, admitted to Douglas Hospital at Washington, and several days afterwards he was transferred to Satterlee Hospital at Philadelphia. Acting Assistant Surgeon D. Kennidy contributed the specimen (*Cat. Surg. Sect.*, 1866, p. 458, *Spec.* 2607) with the following minutes of the case: "Patient was wounded by a shell in the left arm, rendering amputation near the shoulder necessary. The operation was performed upon the battle-field, about fifteen minutes after he received the wound, without the administration of anæsthetics. At the time he was transferred to this hospital he had erysipelas of left side of thorax and back. He was immediately placed on *tinctura ferri chlor. gtts xx* every three hours, and *unguent. ferri sulph.* used locally. The stump, which suppurated freely, was dressed with a poultice. He began to improve, and by June 30th the erysipelas had disappeared and he was fast gaining strength. July 5th: Had slight diarrhœa; prescribed astringents. July 6th: Not so well; very weak. Ordered beef essence and wine whey. July 8th: Bled about a pint from the stump; ice-water and compress applied. July 9th: Had another hæmorrhage early in the morning; subclavian artery ligated at its third part. Present at the operation: Drs. Hayes, Schell, Baldwin, and Roe. Prescribed brandy, one-half ounce every two hours. July 10th: Feels stronger and pulse good; ordered sulphate of quinine, *grs. ii*, three times a day. He continued to do well until the 16th, when he had a hæmorrhage from the artery where it had been ligated; bled about a pint; digital pressure applied. July 17th: No bleeding. Early in the morning of the 18th he lost some blood while changing the fingers. His pulse had been very weak since the 16th, and he was fast losing strength. About 10 o'clock on the morning of the 18th of July he died." The specimen

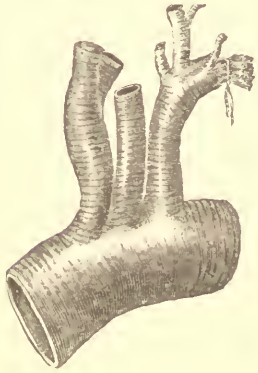

FIG. 422.—Portions of the aorta, innominata, left common carotid, and subclavian arteries. *Spec.* 2607.

consists of a wet preparation of the arch of the aorta, the innominata, left common carotid, and subclavian arteries, terminating at the point of ineffectual ligation of the left subclavian in its third portion, showing the separation of the coats with no formation of clot.

TABLE CXXX.

Condensed Summary of Fifty-one Cases of Ligations of the Subclavian Artery for Shot Injuries.

[Recoveries, 1—10; Deaths, 11—51.]

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF HÆMORRHAGE.	PROBABLE SOURCE OF HÆMORRHAGE.	DATE OF OPERATION.	OPERATION, OPERATOR.	RESULT.
1	*Caughman, G. M.*, K, 13th S. C., age 25.	July 3, 1863.	Shot through chest; subclav'n wounded.	.....	.....	July, 1863.	Ligated in third portion in continuity.	Recovered; arm paralyzed.
2	*Endy, J. T.*, Pt., F, 5th N. C., age 23.	July 2, 1863.	Ball entered below scapula and lodged.	July 16, 17, '63.	.....	July 17, 1863.	In cont. in third portion; lig. subscap.	Furloughed August 31, 1863.
3	Herman, A., Pt., C, 48th N. Y., age 42.	Feb. 20, 1864.	Shot fracture of right humerus; excision.	Sept. 5, 1864.	Posterior circumflex.	Sept. 5, 1864.	In cont. in third portion Surg. A. B. Mott, U. S. V.	Discharged October 4, 1864.
4	Hickey, J., Serg't, M, 1st N. Y. Cav., age 28.	June 5, 1864.	Ball entered below right clavicle.	.....	Axillary aneurism.	Sept. 19, 1864.	Ligated in continuity by Surgeon F. H. Gross, U. S. V.	Discharged May 30, 1865.
5	Hurst, C., Pt., C, 16th Ohio.	Dec. 29, 1862.	Fract. right humerus; amputation.	Jan. 11, 1863.	Brachial on face of stump.	Jan. 11, 1863.	In cont. by Asst. Surg. W. D. Turner, 1st Illinois Art.	Discharged March 7, 1863.
6	Kellogg, E. S., Pt., A, 89th, N. Y., age 21.	June 18, 1864.	Fract. left humerus; amputation arm.	July 25, 1864.	Axillary ligated in stump.	Aug. 8, 1864.	In continuity in third portion by A. A. Surg. R. J. Revis.	Hæm. Aug. 15. Discharged April 6, 1865.
7	Kitrell, J. H., Pt., D, 3d Tennessee.	July 12, 1863.	Fract. right humerus; amp. arm.	July 26, 28, '63.	Hæmorrhage from stump, Aug. 2.	Aug. 2, 1863.	In continuity in third portion.	Furloughed September 3, 1863.
8	Palmer, D. J., Corp'l, C, 8th Iowa, age 20.	Apr. 7, 1862.	Wound of left axillary artery.	April 8, 1862.	Aneurism	Apr. 14, 1862.	In cont. by Surg. T. F. Azpell, U. S. V.	Discharged September 6, 1862.
9	Phelps, J. T., Pt., D, 24th Mass., age 32.	Aug. 16, 1864.	Fract. left shoulder; amputation.	Sept. 26, 1864.	Axillary.....	Sept. 26, 1864.	In cont. by A. A. Surg. J. C. Morton.	Discharged December 13, 1864.
10	Wiggins, C., Pt., G, 9th N. Y. A., age 21.	Mar. 25, 1865.	Ball perforated below right clavicle.	May 7, 1865.	Subclavian.....	May 7, 1865.	Both ends in wound.	Discharged August 3, 1865.
11	Andrews, M., Pt., E, 17th Vt., age 22.	May 12, 1864.	Fract. right humerus; amp. at sh.	July 23, 1864.	Axillary artery	July 27, 1864.	Lig. by A. A. Surg. J. B. Crandall.	Died July 28, 1864.
12	*Averitt, W. S.*, Pt., H, 14th Tennessee.	Aug. 9, 1862.	Fract. left arm; amputation.	.....	Axillary (?)	.....	Ligation of subclavian.	Died January 26, 1863.
13	Brannon, B., Pt., B, 61st N. Y., age 22.	May 8, 1864.	Wound of right shoulder and arm.	May 29, 1864.	Subclavian.....	May 29, 1864.	In cont. by Surg. A. V. Sheldon, U. S. V.	Died June 19, 1864; hæm. rec'd.
14	Broderick, W., Cor'l, C, 199th Pa., age 39.	Apr. 2, 1865.	Left shoulder below clavicle.	Apr. 17, 1865.	Axillary aneurism.	May 30, 1865.	In continuity in outer third.	Died June 11, 1865.
15	Buzzell, H., Serg't, D, 12th N. H., age 21.	June 3, 1864.	Wound right shoulder.	.....	.....	June 17, 1864.	Right; in continuity. Surg. N. R. Moseley, U. S. V.	Died June 29, 1864, of hæm. *Spec.* 2812, A. M. M.
16	*Click, J. B.*, Pt., G, 5th Virginia Cav.	Nov. 8, 1863.	Wound in right axilla; lesion axillary artery.	.....	Large aneurismal tumor.	Dec. 16, 1863.	Right; in continuity. Asst. Surgeon J. C. Baylor, C. S. A.	Died Dec. 17, 1863.
17	Conant, A. E., Pt., K, 8th Maine, age 22.	May 20, 1864.	Fracture head left humerus; amp. at shoulder joint.	May 24, 25, '64.	Axillary	May 26, 1864.	Left; in continuity. A. A. Surgeon T. Liebold.	Died May 29, 1864; exhaustion.
18	Conterman, T. J., Pt., G, 48th N. Y., age 21.	May 9, 1864.	Wound in right axilla.	May 27, 30, '64.	Subscapular artery and axillary vein.	May 31, 1864.	Right; in continuity. A. A. Surgeon G. F. Shrady.	June 2, br. ax. plex. veins lig. Died June 2, 1864. *Spec.* 4331.
19	*Denton, F. M.*, Pt., H, 4th S. C. Cav., age 34.	May 28, 1864.	Flesh wound shoulder and chest.	Aug. 28, 1864.	Axillary aneurism.	Sept. 1, 1864.	Left; in continuity. A. Surg. J. C. McKee, U. S. A.	Amp. at shoulder jt. Died September 2, 1864.
20	Dow, S. E., Color Serg't, 4th N. Y., age 21.	Oct. 27, 1864.	Shot wound of chest.	Nov. 5, 1864.	Subclavian.....	Nov. 5, 1864.	Right; in continuity. Assistant Surgeon H. Allen, U. S. A.	Died November 18, 1864; hæmorrhage.
21	Downing, S., Pt., C, 9th Ill. Cav., age 21.	July 14, 1864.	Fracture right arm; amputation.	Aug. 8, 10, '64.	Brachial	Aug. 10, 1864.	Right; in cont. A. A. Surg. J. N. Sharp.	Died August 30, 1864. *Spec.* 2568.
22	Everly, F. M., Pt., G, 17th Kentucky.	Apr. 7, 1862.	Fract. right humerus; amp. at sh. jt.	Apr. 20, 1862.	Stump	Apr. 20, 1862.	Right; in continuity.	Died April 20, 1862; exhaustion.
23	Gates, E. O., Serg't, M, 4th N. Y. H. A., age 22.	June 4, 1864.	Flesh wound of right arm.	June 25, 1864.	Brachial; axillary ligated.	July 1, 1864.	Right; in continuity. A. A. Surgeon T. G. Morton.	Died July 1, 1864. *Spec.* 2545.
24	Graves, H., Pt., B, 5th Pa. Cav., age 25.	Oct. 7, 1864.	Wound left side of neck.	Dec. 14, 1864.	Subclavian artery.	Dec. 16, 1864.	Left; in continuity. Asst. Surg. W. E. Day, 117th N. Y.	Died December 18, 1864.
25	Grimm, A., Pt., D, 7th Conn., age 21.	June 9, 1864.	Fracture right clavicle.	June 28, 1864.	Aneurism.....	June 30, 1864.	Right; in continuity.	Died July 9, 1864.
26	Grothenn, H., Serg't, K, 5th Cav., age 28.	June 9, 1863.	Right shoulder; axillary artery wound.	Aug. 18, 1863.	Aneurism.....	Aug. 18, 1863.	Right; in cont. Surg. R. H. Coolidge.	Died Aug. 18, 1863. *Spec.* 2609, A. M. M.
27	Henderson, J. H., Pt., F, 57th Pa.	May 31, 1862.	Flesh wound left arm	June 19, 1862.	.....	June 23, 1862.	Left; in continuity..	Died June 27, 1862; pyæmia.
28	Hites, J., Pt., C, 7th Iowa, age 19.	Oct. 3, 1862.	Wound in right axilla	Oct. 22, 1862.	Axillary artery....	Oct. 22, 1862.	R't; in cont. Surg. J. S. Hodgden, U. S. V.	Died Oct. 31, 1862.
29	*Holshowes, W. W.*, Serg't, 3d S. C. Bat.	Nov. 30, 1863.	Wound left lung	Feb. 27, 1864.	Subclavian.....	Feb. 27, 1864.	Left; in cont. Surg. B. B. Breed, U. S. V.	Died March 11, 1865; pyæmia.
30	*Howard, A. C.*, Confederate.	May 31, 1862.	Left shoulder; inj. spine.	.....	.....	June 7, 1862.	Left; in continuity..	Died June 8, 1862.
31	Ingalls, D. W., Pt., B, 6th Conn., age 35	May 20, 1864.	Wound of chest.....	.....	Branches axillary.	June 18, 1864.	Ligation; in continuity.	Died June 24, 1864; pyæmia. *Spec.* 4089.
32	*Jordan, J. F.*, Capt., B, 13th Va Cavalry, age 31.	June 21, 1863.	Left axillary artery divided.	July 12, 1863.	Aneurism.....	July 14, 1863.	Left; in cont. Surg. J. A. Lidell, U. S. V.	Died Aug. 29, 1863. *Spec.* 1684, A. M. M.
33	*Kahea, K. P.*, Pt., B, Jeff. Davis' Legion, age 29.	June 14, 1864.	Through left axilla, sev. axillary artery.	July 10, 1864.	Aneurism.....	July 23, 1864.	Left; in continuity. Surg. W. Seldon, C. S. A.	Died July 31, 1864.
34	*King, J. W.*, Pt., C, 29th N. Carolina.	Sept. 19, 1863.	Fracture head; right humerus.	Oct. 10, 11, '63.	.....	Oct. 11, 1863.	Right; in continuity	Died Oct. 21, 1863.
35	Klechner, G. M., Cor. D, 93d Ill., age 23.	Oct. 5, 1864.	Left arm and chest..	.....	.....	Oct. 13, 1864.	Left; in cont. Surg. J. H. Grove, U. S. V.	Died Oct. 13, 1864.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
36	L'Aimée, A. B., Pt., G, 51st N. Y., age 21.	Mar. 14, 1862.	Fracture right humerus; amp. arm.	Mar. 29, 1862.	Stump	Mar. 29, 1862.	Right; in cont. Surg. G. Derby, 23d Mass.	Died April 5, 1862; pyæmia.
37	McMichael, H., Pt., A, 57th Ind., age 19.	Nov 30, 1864.	Wound chest, inj. axillary artery.	Dec. 11, 1864.	Axillary artery....	Dec. 11, 1864.	Right; in cont. Surg. S. E. Fuller, U. S. V.	Died Dec. 16, 1864.
38	Malott, E., Pt., K, 62d Ohio, age 28.	April 2, 1865.	Fracture right humerus; excision.	April 18, 1865.	Brachial artery....	April 18, 1865.	Right; in continuity.	Died April 20, 1865.
39	Moore, W. R., Pt., E, 57th Mass., age 23.	Oct. 8, 1864.	Fracture right humerus; amputat'n at shoulder joint.	Nov. 21, 1864.	Axillary artery ..	Nov. 21, 1864.	Right; in continuity. Asst. Surg. C. Wagner, U. S. A.	Died November 27, 1864.
40	Mowrey, H. B., Corporal, B, 6th Pa. Res., age 26.	Sept. 17, 1862.	Fracture left humerus.	Sept. 26, 1862.	.....	Sept. 26, 1862.	Left; in continuity. Surg. A. B. Hasson, U. S. A.	Amputat'n at shoulder j't. Died September 27, 1862.
41	Peterson, S. R., Pt., D, 14th Inf.	May 3, 1863.	Left arm shattered; amputation arm.	July 8, '9, '63.	Stump	July 9, 1863.	Left; in continuity. A. A. Surg. D. Kennidy.	Died July 18, 1863. *Spec.* 2607, A. M. M.
42	Pflüger, E., Pt., H, 2d Pa. Art., age 28.	June 27, 1864.	Fracture right scapula.	July 14, 1864.	——; lig. axillary artery.	July 25, 1864.	Right; in continuity.	Died August 10, 1864.
43	Reed, A., Pt., B, 6th Massachusetts.	Jan. 30, 1863.	Fracture right arm; amputat'n at shoulder joint.	Feb. 6, 1863.	Axillary artery ...	Feb. 7, 1863.	Right; in cont. Asst. Surg. O. M. Humphrey, 6th Mass.	Died February 27, 1863.
44	Shasteen, W., Scout	Nov. 15, 1864.	Fracture right clavicle and rib.	.....	.....	Dec. 14, 1864.	Right; in continuity. Asst. Surg. S. C. Ayres, U. S. V.	Died December 14, 1864. *Spec.* 4729, A. M. M.
45	Smith, A. H., Pt., F, 25th Iowa, age 30.	Jan. 11, 1863.	Fracture right elbow joint; amputation arm.	April 4, 6, '63.	Brachial artery....	April 6, 1863.	Right; in continuity. Surg. C. T. Alexander, U. S. A.	Died April 14, 1863.
46	Smith, P., Sergt., E., 84th Pa., age 33.	Sept. 30, 1864.	Flesh wound right arm.	Oct. 12, 1864.	Brachial artery; artery ligated.	Oct. 21, 1864.	Right; in continuity. A. A. Surg. J. C. Morton.	Died November 22, 1864; pyæmia.
47	Staines, S., Pt., C., 53d Pa., age 25.	July 2, 1863.	Flesh wound right arm.	July 23, 1863.	Brach. artery lig.; Aug. 2, amp. arm.	Aug. 23, 1863.	Right; in continuity.	Died September 2, 1863.
48	Stilwell, J., Pt., I, 1st Maryland Cavalry, age 21.	Aug. 16, 1864.	Fracture head; left humerus; Sept. 21, excision.	Sept. 21, 1864.	Axillary artery....	Sept 21, 1864.	Left; in continuity. A. A. Surg. J. C. Morton.	Died September 23, 1864.
49	Ward, T., Corp'l, C, 2d Pa. Res.	June 25, 1862.	Wound in left axilla	Mar. 14, 1863.	Aneurism.....	Mar. 15, 1863.	Left; in continuity. Prof. S. D. Gross.	Died March 17, 1863.
50	Wisser, H. H., Corporal, F, 27th Massachusetts, age 34.	June 15, 1864.	Left arm shattered; amputat'n at shoulder joint.	July 13, 1864.	Stump; axillary ligated.	Aug. 6, 1864.	Left; in continuity..	Died August 17, 1864.
51	Wright, S. A., Capt., F, 55th Illinois.	April 6, 1862.	Fracture left humerus; wound of hip.	May 9, 1862.	Axillary artery....	May 9, 1862.	Left; in continuity..	Died May 12, 1862.

Twelve cases of ligations of branches of the subclavian were reported. Two were ligations of the internal mammary, six of the intercostals, one of the thyroid axis, one of the superficial cervical, and two of the suprascapular arteries. The two operations on the internal mammary and two of the ligations of the intercostal artery were fatal:

Ligations of the Internal Mammary.—Cases 1117-1118.—Private A. Campbell, Co. A, 2d Pennsylvania Heavy Artillery, wounded near Petersburg, June 29, 1864; penetration of chest near second rib; hæmorrhage July 13; ligation of internal mammary by Surgeon O. A. Judson, U. S. V.; death July 19, 1864. (*First Surg. Vol.*, p. 548.)—Private J. Gallin, F, 65th New York, aged 30; wounded at Spottsylvania May 8, 1864; penetration of chest and wound of internal mammary; hæmorrhages; ligation of artery May 19, 1864, by Surgeon R. B. Bontecou, U. S. Vols.; death May 24, from recurring hæmorrhage. (*First Surg. Vol.*, p. 548.)

Ligations of Intercostals.—Cases 1119-1124.—Private R. Morris, K, 142d Pennsylvania, aged 25; shot wound of chest, Fredericksburg, Dec. 12, 1862; hæmorrhage January 20, 1863; ligation of intercostal, one end in wound; discharged from service June 13, 1863. (*First Surg. Vol.*, p. 550.)—Private S. Scofield, D, 6th Connecticut, age 21; shot wound of chest, Drury's Bluff, May 14, 1864; hæmorrhage May 27; ligation of intercostal artery by Asst. Surg. W. H. Gardner, U. S. A.; ligature passed around rib; no recurrence of hæmorrhage; discharged September 3, 1864. (*First Surg. Vol.*, p. 550.)—Private *J. B. Bruce*, C, 31st Alabama, aged 17; shot fracture of ninth rib, at Shiloh, April 6, 1862; April 29, hæmorrhage from intercostal; both ends ligated in wound by Asst. Surg. B. Howard, U. S. A.; ligature included rib; death April 29, from hæmorrhage. (*First Surg. Vol.*, p. 550.)—Private J. H. Butterfield, F, 3d Vermont, wounded in chest, at Lee's Mill's, April 16, 1862; hæmorrhage April 25; ligation of intercostal artery; hæmorrhage recurred April 27; artery religated; death May 4, 1862. (*First Surg. Vol.*, p. 551.)—Private J. Mahew, D, 100th Pennsylvania; shot fracture of rib May 24, 1864; ligation of intercostal; death May 26, 1864. (*First Surg. Vol.*, p. 551).—Private P. F. Wilson, A, 33d Ohio; penetrating wound of chest, Chickamauga, September 20, 1863; hæmorrhage October 4; ligation of intercostal October 5; death October 30, 1863. (*First Surg. Vol.*, p. 551.)

Ligation of Thyroid Axis.—Case 1125.—Private A. P. Dunem, Co. H, 1st New Jersey Cavalry, aged 46; shot wound of right shoulder, ball passing over clavicle, June 3, 1864; June 30th, hæmorrhage of thirty ounces from thyroid axis; artery ligated on the same day, one end in wound; returned to duty December 7, 1864.

Ligation of Superficial Cervical Artery.—Case 1126.—Private J. H. Potter, F, 15th Massachusetts; shot wound of left posterior triangle of neck June 18, 1864; July 13, hæmorrhage from superficial cervical; one end ligated in wound on the same day; transferred to V. R. C. May 16, 1865.

Ligations of Suprascapular Arteries.—Cases 1127-1128.—Corporal T. Barrick, 44th New York, age 25; shot wound of side of neck July 2, 1863; hæmorrhage from suprascapular July 21st; artery ligated on same day by A. A. Surgeon D. Kennidy; discharged March 26, 1864. (*First Surgical Volume*, p. 422.)—Private S. Sickles, H, 14th New Jersey, age 27; shot penetration of chest and fracture of scapula July 9, 1864; hæmorrhage, probably from diffuse aneurism, August 1, 1864; both ends of suprascapular artery ligated; no recurrence; discharged July 6, 1865. (*First Surgical Volume*, p. 549.)

Ligations of the Axillary Artery.—The total number of ligations of the axillary artery reported is forty-nine; of these seven recovered and forty-two proved fatal, a mortality rate of 85.7 per cent. The operation was on the right side in seventeen, on the left in twenty-five instances; in seven the side was not stated. In fifteen instances amputation of the arm had been performed. In four of these fifteen cases re-ligation of the artery was performed on the face of the stump, and in eleven in the continuity. In one instance only was the artery ligated on the field immediately after the injury, for primary bleeding. Of the forty-nine operations, hæmorrhages recurred in twenty-one, only one of which terminated in recovery after amputation of the arm. Four operations were performed for aneurism. The specimen (No. 3630, *Surg. Sect.*) of one of these cases is preserved in the Army Medical Museum and is shown in FIG. 423. It is a wet preparation of the axillary artery, and shows loss of substance by sloughing; slight hæmorrhage occurred on the seventeenth day, which was controlled by pressure; severe hæmorrhage followed on the nineteenth day; an immense aneurism formed, which was opened, and ligatures placed on both sides of the injury; mortification supervened; the arm was amputated at the shoulder, but death ensued several hours after the operation. The case is reported in detail on page 443 of the *Second Surgical Volume* (CASE 1255).

FIG. 423.—Axillary art'ry showing loss of substance from sloughing. *Spec.* 3630.

TABLE CXXXI.

Condensed Summary of Forty-nine cases of Ligation of the Axillery Artery for Shot Injuries.

[Recoveries, 1—7; Deaths, 8—49.]

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF HÆMORRHAGE.	PROBABLE SOURCE OF HÆMORRHAGE.	DATE OF OPERATION.	OPERATION, OPERATOR.	RESULT.
1	Coolream, P., Pt., B, 61st N. Y., age 45.	May 8, 1864.	Fract. head right hum.; excision.	May 24, 1864	.....	May 24, 1864.	Right; in continuity	Discharged October 13, 1865.
2	Cutler, F. R., Pt., K, 72d Pennsylvania.	Sept. 17, 1862.	Fract. right hum.; ampt'n at sh'd'r j't.	Oct. 19, 1862.	Axillary	Oct. 20, 1862.	Right; in cont. Surg. H. S. Hewit, U. S. V.	Disch. Aug. 10, 1864. Died May 11, 1873.
3	Fries, A., Corp'l, E, 100th Ill., age 26.	Sept 19, 1863.	Fract. right hum.; amputation arm.	Nov. 8, 9, 1863.	.....	Nov. 9, 1863.	Right; in cont. Surg. A. McMahon, 64th Ohio.	Discharged April 18, 1864.
4	James, W., —, D, 83d Pa., age 20.	July 2, 1863.	Wound in brachial border axilla.	July 14, 1863.	Brachial	July 14, 1863.	——; in continuity ..	Recovered.
5	Sobbey, W., Pt., G, 51st Pa., age 29.	July 12, 1864.	Flesh wound right arm.	July 23, 24, 1864.	Brachial	July 24, 1864.	Right; in continuity	Recovered.
6	Vancellette, T., Pt., D, 3d Vt., age 21.	Apr. 16, 1862.	Flesh wound left arm.	Apr. 18, 23, 1862.	Brachial	April 23, 1862.	Left; in cont. Surg. R. B. Bontecou, U. S. V.	Apr. 25; ampt'n arm. Disch. Jan. 13, 1863.
7	Williams, A. E., Pt., B, 7th Mich., age 27.	July 2, 1863.	Flesh wound right arm.	Aug. 4, 1863.	.. ..	Aug. 4, 1863.	Right; both ends in wound.	Ret'd to duty April 25, 1864.
8	Aldrich, A., Pt., F, 25th Mass., age 25.	June 3, 1864.	Wound in left axilla	June 15, 1864.	Small artery ligated.	June 17, 1864.	Left; in continuity..	Died June 17, 1864. *Spec.* 2576, A. M. M.
9	*Baggs, W. A.*, Pt., E, 20th Georgia Cav.	.....	Flesh wound right shoulder.	June 23, 24, 1864.	Axillary	June 25, 1864.	Artery ligated	Died June 28, 1864.
10	Corrie, J. S., Serg't, A, 11th Mo., age 25.	May 22, 1863.	Fracture left hum.; ampt'n at sh'd'r j't.	June 6, 7, 1863.	Posterior circumflex.	June 7, 1863.	Left; in continuity; recurred.	June 8, brs. acrom. thor.lig. Died June 9, 1863.
11	*Davis, H. J.*, Pt., G, 5th N. C., age 41.	June 21, 1864.	Fracture left humerus.	June 22, 1864.	Brachial	June 22, 1864.	Left; in continuity; amputation arm.	Hæm. July 3. Died July 6, 1864.
12	Dawson, M. M., Lt. Col., 100th Pennsylvania, age 38.	June 17, 1864.	Flesh wound left shoulder.	June 27, 1864.	Axillary artery ...	June 27, 1864.	Left; both ends in wound.	Hæm recur'd. Died June 30, 1864.
13	Downing, W. E., Pt., I, 16th Pennsylvania Cavalry, age 19.	May 28, 1864.	Wound through left axillary space.	June 12, 1864.	Axillary artery ..	June 15, 1864.	Left; both ends in wound; vein also tied.	Died June 28, 1864.
14	Dunn, N., Pt., H, 38th Wisconsin, age 19.	Apr. 2, 1865.	Fracture left humerus.	.....	Axillary	May 4, 1865.	Left; in cont. Ass't Surg. O. P. Sweet, U. S. V.	Died May 8, 1865; exhaustion.
15	Foley, M., Pt., K, 11th Ill. Cav., age 20.	Mar. 3, 1864.	Wound right arm; cutting axillary.	Mar. 3, 1864.	Axillary	Mar. 5, 1864.	One end in wound. A. A. Surg. W. B. Trull.	Religated. Died March 10, 1864.
16	Friedeboldt, F., Pt., K, 5th Michigan.	May 31, 1862.	Flesh wound arm; injury brachial art.	.....	Brachial	June 10, 1862.	In cont. A. A. Surg. C. C. Page; subscap. artery also tied.	Died July 14, 1862.
17	Gillies, P., Pt., H, 131st N. Y., age 25.	Oct. 19, 1864.	Fracture head left humerus.	Oct. 26, 1864.	Aneurism; amputation sh'd'r j't.	Oct. 31, 1864.	Left; on face stump	Died Nov. 1, 1864, of rec. hæmorrhage.
18	Goodheart, J. F., Pt., F, 88th Pa., age 29.	May 10, 1864.	Fracture left arm; amputation arm.	.....	Stump	June 4, 1864.	Left; in continuity..	Died June 5, 1864.
19	Hall, W., Pt., H, 15th Infantry, age 19.	Jan 11, 1866.	Wound of chest; fractured rib.	Jan. 11, 20, 1866.	Axillary	Jan. 22, 1866.	Right. A. A. Surg. R. W. Coale.	Died Jan'ry 22, 1866. *Spec.* 2674.
20	Hankin, J., Pt., H, 1st Mich. S.S., age 17.	June 17, 1864.	Fract. head of right humerus; excision.	July 23, 1864.	Axillary	July 23, 1864.	Right axillary art'y ligated.	Died July 24, 1864; hæmorrhage.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
21	Herpst, H., Serg't, H, 119th Pa., age 25.	May 5, 1864.	Fract. r't humerus; amputation arm.	June 13, 1864.	Axillary	June 13, 1864.	Right; in cont. A. A. Surg. J. C. Nelson.	Died June 15, 1864. *Spec.* 2463, A. M. M.
22	Hills, J. W., Pt., A, 145th Pa., age 24.	Dec. 13, 1862.	Wound through left axilla.	Dec. 23, 1862.	Subscapular art'y.	Dec. 23, 1862.	Left; in continuity..	Died Dec. 29, 1862.
23	Hoggard, J., Pt., E, 137th Ills., age 20.	Aug. 21, 1864.	Fract. right humerus; amp. sh. joint.	Sept. 9, 1864.	Brachial	Sept. 9, 1864.	Right; in continuity; relig. Sept. 11.	Hæm. Died Sept. 12, 1864.
24	Hollingshead, A., Corp'l, H, 12th Ky.	June 21, 1864.	Wound in upper 3d right arm.	June—, 1864.	Brachial aneurism	June 24, 1864.	Right; both ends in wound. Surg. E. Shippen, U. S. V.	Died June 26, 1864.
25	Hurd, F., Corp'l, F, 8th Maine, age 24.	May 16, 1864.	Flesh wound of left arm.	May 21, 1864.	Brachial; art. tied; hæm. rec. May 25, June 1.	June 1, 1864.	Left; in cont. A. A. Surg. J. H. Jamar.	Died June 1, 1864.
26	Leddic, J., Pt., E, 118th New York.	June 30, 1864.	Flesh wound of left arm.	June 30, 1864.	Brachial	June 30, 1864.	Left; in cont. Surg. T. H. Squire, 89th New York.	Died July 2, 1864.
27	Lightfoot, J., Pt., E, 25th Mass., age 28.	Aug. 10, 1864.	Flesh wound of left shoulder.	Aug. 27, 29, 1864.	Axillary; diffused aneurism.	Sept. 17, 1864.	Left; both ends in wound. A. A. Surg. L. K. Baldwin.	Sept. 19, amp. at sh. j. Died Sept. 19, 1864. *Spec.* 3630.
28	*McTough, J. H.*, Pt., I, 45th Ga., age 23.	May 3, 1863.	Fracture humerus; amp. at sh. joint.	May 27, 1863.	Axillary artery ...	May 27, 1863.	Ligated on face of stump.	Died June 3, 1863.
29	Mackey, J., Serg't, I, 50th Pa., age 23.	May 25, 1864.	Wound left arm, div. axillary artery.	.....	Axillary	June 5, 1864.	Left axillary. A. A. Surg. H. Craft.	Died June 5, 1864.
30	Marquis, W. H., Pt., E, 85th Pa., age 20.	Aug. 27, 1863.	Fracture right arm; amp. at sh. joint.	Sept. 12, 1863.	Brachial	Sept. 12, 1863.	Right; on face of stump.	Died Sept. 12, 1863.
31	Melley, E. C., Pt., K, 2d West Virginia.	Nov. 6, 1863.	Wound of chest	Nov. 18, 1863.	Aneurism	Nov. 19, 1863.	Right axillary tied. Surg. S. N. Sherman.	Died Nov. 19, 1863.
32	Miller, E. D., Pt., F, 90th Pennsylvania.	Aug. 30, 1862.	Flesh wound of arm, inj. brachial art.	Sept. 5, 1862.	Brachial	Sept. 6, 1862.	Axillary tied in continuity.	Died Sept. 12, 1862.
33	*Moore, H. C.*, Pt., A, 26th Georgia.	May 12, 1864.	Flesh wound, left arm.	May 19, 1864.	Axillary	May 19, 1864.	Left axillary tied ...	May 23, amputation at shoulder joint. Died May 23, 1864.
34	Morgan, W., Pt., F, 126th N. Y., age 22.	July 2, 1863.	Fracture humerus; amputation sh. jt.	July 19, 1863.	Axillary	July 19, 1863.	Axillary tied in continuity.	Died July 19, 1863.
35	Morgan, W. B., Pt., F, 17th Connecticut, age 24.	July 3, 1863.	Fracture left arm; amputation arm.	July 20, 1863.	.....	July 20, 1863.	Left; in continuity. Aug. 3, religated.	Died Aug. 16, 1863.
36	Moser, J., Pt., B, 51st Ill., age 18.	Nov. 30, 1864.	Fracture right scapula.	Dec. 12, 1864.	Enlarged vessel, collateral circula.	Dec. 14, 1864.	Right; in continuity	Hæm. rec. Dec. 19. Died Dec. 21, 1864.
37	Oldfield, T., Sergt., D, 10th Michigan, age 33.	July 20, 1864.	Flesh wound left arm	.....	.....	Aug. 10, 1864.	Left; in continuity. A. A. Surg. J. C. Thorpe.	Died Aug. 16, 1864; irritative fever.
38	Ourish, P., Sergeant, E, 32d Massachusetts, age 19.	May 30, 1864.	Fract. left humerus	May 31, 1864.	Axillary	May 31, 1864.	Left; in cont., June 7, relig. A. Surg. G. A. Mursick, U. S. V.	June 8, amputation shoulder jt. Died June 8, 1864.
39	Packard, G. R., Pt., F, 3d Me., age 21.	May 31, 1862.	Fract. left humerus; amputation arm.	July 1, 1862.	....	July 28, 1862.	Left; in cont. A. A. Surg. S. Teal.	Died Aug. 5, 1862; recurrent hæm.
40	*Raper, W.*, Pt., G, 5th N. C.	May 5, 1862.	Flesh wound right arm.	June 13, 1862.	.....	June 13, 1862.	Right; in continuity. Surg. R. B. Bontecou, U. S. V.	Died June 14, 1862.
41	Richards, S., Corp., M, 11th Pa., age 25.	Aug. 25, 1864.	Flesh wound left arm	Sept. 6, 1864.	Brachial	Sept. 6, 1864.	Left; in cont. A. A. Surg. W. P. Moon. Relig. Sept. 11.	Died Sept. 18, 1864.
42	Sawyer, D., Pt., D, 31st Me., age 33.	July 30, 1864.	Fracture head left hum.; amp. sh. jt.	Aug. 8, 9, 1864.	.....	Aug. 8, 9, 1864.	Left; tied 3 times on face of stump.	Died Aug. 9, 1864; asthenia.
43	Sheppard, J. F., Pt., A, 18th Mass., age 25.	July 2, 1863.	Wound through left axillary space.	July 14, 1863.	.....	July 14, 1863.	Left; in continuity; religated July 19, 23.	Died July 24, 1863.
44	Smith, D., Pt., E, 6th Penn. Cavalry, age 29.	June 12, 1864.	Flesh wound left arm		Aneurism; brach.; lig. twice; amp. at shoulder joint.	Aug. 7, 8, 1864.	Left; in cont. Asst. Surg. H. S. Schell, U. S. A. Religated.	Died Aug. 8, 1864.
45	Stetson, S. M., Pt., B, 32d Me., age 19.	May 31, 1864.	Fracture right arm; amputation arm.	June 22, 1864.	.....	June 22, 1864.	Right; in cont. A. A. Surgeon J. F. Thompson.	Died June 22, 1864; exhaustion.
46	Tighe, C., Pt., F, 56th Mass., age 18.	June 16, 1864.	Wound left chest and arm.	July 1, 1864.	Axillary	July 2, 1864.	Axillary tied. Surg. R. B. Bontecou, U. S. V.	Died July 4, 1864; exhaustion.
47	Van Gasback, W. A., Pt., 11th New York Battery, age 23.	June 6, 1864.	Fract. left humerus; amputation at sh. joint.	June 12, 1864.	.....	June 18, 1864.	Left; in continuity; religated June 23.	Died June 23, 1864; exhaustion.
48	Walsh, D., Pt., D, 106th N. Y., age 23.	Oct. 19, 1864.	Wound left shoulder.	Nov. 3, 1864.	Axillary art. and vein.	Nov. 3, 1864.	Left; axillary artery and vein tied. A. A. Surg. E. L. Duer.	Hæm. recurred Nov. 13, 15. Died Nov. 15 1864.
49	Yoho, P., Corpl., F, 116th Ohio, age 37.	Sept. 19, 1864.	Flesh wound left arm	Oct. 4, 1864.	Brachial	Oct. 7, 1864.	Left; in cont. A. A. Surg. W. L. Wells.	Died Oct. 22, 1864; pyæmia. *Spec.* 3679.

Twenty-two ligations of branches of the axillary were reported: one (fatal) of a branch of the acromial thoracic artery; two (one recovery, one fatal) of the subscapular; eighteen (eleven recoveries, seven fatal) of the circumflex; and one (fatal) of the muscular branch.

Ligation of Branch of the Acromial Thoracic Artery.—Case 1129.—Lieutenant A. Stephens, C, 121st Ohio, wounded at Chickamauga September 19, 1863, in right chest; hæmorrhage October 6th; October 10th, ligation of branch of acromial thoracic in wound; hæmorrhage recurred; death October 22, 1863.

Ligations of Subscapular Artery.—Cases 1130–1131.—Private E. Burk, I, 81st Pennsylvania, age 20; fracture of head of left humerus May 12, 1864; May 20, excision; May 23, hæmorrhage from subscapular; ligation in wound on the same day; hæmorrhage recurred May 28; death from pyæmia June 28, 1864.—Private J. Stottlemeyer, C, Cole's Maryland Cavalry; fracture of spine of left scapula June 6, 1864; June 19, 20, hæmorrhages; July 24, ligation of subscapular in continuity; returned to duty December 3, 1864.

Ligations of Circumflex.—Of eighteen cases, eleven recovered and seven were fatal.

TABLE CXXXII.

Condensed Summary of Eighteen Ligations of the Circumflex Artery for Shot Injury.

[Recoveries, 1—11; Deaths, 12—18.]

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
1	Boothman, W., Pt., B, 173d N. Y., age 18.	June 14, 1863.	Fracture right shoulder; excision.	June 25, 1863.	Circumflex artery	June 25, 1863.	Right; both ends in wound.	Discharged Jan. 31, 1864.
2	Detweiler, —, Corp'l, G, 198th Pa., age 18.	Mar. 29, 1865.	Wound right arm ...	Apr. —, 1865.	Posterior circumflex.	Apr. —, 1865.	Posterior circumflex ligated.	Discharged June 10, 1865.
3	Gear, S., Corp'l, H, 49th Ohio, age 18.	Dec. 16, 1864.	Fracture right humerus; excision.	Dec. 26, 1864.	Posterior circumflex.	Dec. 26, 1864.	Right; one end in wound. A. A. Surg. S. M. Blackwood.	Discharged June 29, 1865.
4	Howard, J. R., Pt., B, 7th Iowa.	Nov. 7, 1861.	Fracture humerus; amputation arm.	Nov. 24, 1861.	Anterior circumflex.	Nov. 24, 1861.	Ligated on face of stump.	Discharged June, 1863.
5	[1] Irvine, S., Corp'l, I, 67th Pa., age 23.	Sept. 22, 1864.	Right arm, injured humerus.	Oct. 28, 1864.	Anterior circumflex artery.	Oct. 28, 1864.	Right anterior circ. artery ligated.	Amp. at sh. jt. Dis. Sept. 9, 1865.
6	Sharp, H. J., Serg't, F, 6th N. Y. Cav., age 21.	Aug. 29, 1864.	Flesh wound of left shoulder.	Sept. 8, 1864.	Posterior circumflex artery.	Sept. 8, 1864.	Left; both ends in wound.	Vet. Reserve Corps Feb. 10, 1865.
7	Smith, S., Pt., H, 150th Pa., age 36.	May 10, 1864.	Fracture right humerus; excision.	May 26, 28, 1864.	Posterior circumflex artery.	May 28, 1864.	Right; in wound....	Discharged Jan. 7, 1865.
8	Spray, J. C., Pt., G, 71st Ohio, age 22.	Dec. 16, 1864.	Fracture right humerus; excision.	Jan. 10, 1865.	....	Jan. 10, 1865.	Right; post. circ. Surg. J. H. Grove, U. S. V.	Jan. 22, amputated arm. Discharged May 16, 1865.
9	Wager, S., Pt., B, 1st Art.	June 3, 1864.	Fracture right humerus; amp. sh. jt.	June 10, 1864.	Circumflex	June 10, 1864.	Right; on face of stump.	Disch. Mar. 16, 1865. Died Dec. 31, 1868.
10	Ward, A. D., Corp'l, F, 15th Mass., age 25.	July 2, 1863.	Flesh wound of left shoulder.	July 13, 1863.	Posterior circumflex artery.	July 13, 1863.	Left; one end in wound.	Discharged July 28, 1864.
11	Yarick, R., Pt., G, 1st Mich., age 27.	June 3, 1864.	Flesh wound, left arm	July 14, 1864.	Anterior circumflex artery.	July 14, 1864.	Left; one end in wound.	Vet. Reserve Corps Feb. 10, 1865.
12	Beckwith, R. J., Pt., B, 12th New York Cav., age 28.	Mar. 9, 1865.	Fracture head right humerus; excision.	May 8, 1865.	Posterior circumflex artery.	May 8, 1865.	Right; in continuity	Died May 12, 1865; pyæmia.
13	Lyon, Z. S., Pt., I, 17th Vt., age 20.	Apr. 2, 1865.	Fract. r't scapula; ball lodged in lung.	Apr. 14, 1865.	Brs. circumflex artery.	Apr. 16, 1865.	Several small brs. circumflex ligated.	Died April 21, 1865.
14	Monahan, J., Corp'l, E, 22d Mass., age 38.	May 5, 1864.	Fract. rt. hum.; exc.; amputation arm.	Sept. 19, 1864.	Anterior circumflex.	Sept. 19, 1864.	Right; in continuity	Amp. sh. jt. Died Sept. 26, 1864. *Spec.* 3331, A. M. M.
15	Sanford, J. E., Pt., D, 7th Mass., age 24.	May 6, 1864.	Fracture right humerus; excision.	June 7, 1864.	Circumflex artery.	June 7, 1864.	Right; one end in wound.	Hæm. recur'd. Died June 16, 1864.
16	Stoutenberg, M., Serg't, C, 148th N. Y., age 24.	May 5, 1864.	Fracture left humerus.	June 15, 1864.	Posterior circumflex artery.	June 16, 1864.	Left. Surg. H. Palmer, U. S. V.	Died June 18, 1864.
17	Welch, B. A., Serg't, H, 1st D. C. Cav., age 20.	Aug. 25, 1864.	Fract. left hum.; excision; amputation at shoulder joint.	Sept. 24, 1864.	Stump	Sept. 24, 1864.	Anterior and posterior circumflex on face of stump.	Died Oct. 11, 1864. *Spec.* 3675, A. M. M.
18	Zwick, G. T., Serg't, I, 27th Mich., age 27.	May 12, 1864.	Flesh wd. left shoulder.	July 2, 1864.	Posterior circumflex artery.	July 2, 1864.	Left; in wound	Died July 15, 1864; exhaustion.

Ligation of Muscular Branch of Axillary.—CASE 1132.—Private E. Draper, A, 3d Delaware, aged 23; shot flesh wound of axilla; axillary artery divided March 31, 1865; amputation at shoulder April 9, 1865; hæmorrhage from muscular branch April 16th, ligation on face of stump; no recurrence of hæmorrhage; death from exhaustion April 16, 1865.

Ligations of the Brachial Artery.—One hundred and seventy cases of ligation of the brachial artery were reported; one hundred and nineteen were successful and fifty-one were fatal, a mortality rate of 30.0 per cent.

TABLE CXXXIII.

Summary of One Hundred and Seventy Cases of Ligations of the Brachial Artery.

[Recoveries, 1—119; Deaths, 120—170.]

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
1	Babcock, F., Serg't, M, 6th Ill. Cav.	Feb. 21, 1864.	Flesh; left hand	——— 1864.	Palmar arch	Mar. 14, 1864.	In continuity. A. A. Surg. A. Sterling.	Duty, July 13, 1864.
2	Babcock, O. P., Serg't, H, 207th Pa., age 25.	April 2, 1865.	Fracture left radius, upper third.	Apr. 12, 1865.	Rec. branch radial.	Apr. 12, 1865.	In continuity, lower fourth. A. Surg. H. Allen, U. S. A.	Discharged June 2, 1865.
	Becker, W., Serg't, B, 98th Pennsylvania.	July 2, 1863.	Fracture left wrist ..	July 14, Aug. 30, 31, 1863.	Ulnar radial.....	After Aug. 31, 1863.	In continuity.....	Discharged August 17, 1864.
4	Bergner, F., Pt., B, 121st Pa., age 21.	May 25, 1864	Flesh; left arm, middle.	June 13, 1864.	Brachial	June 11, 13, 1864.	Both ends in wound. A. A. Surg. E. De Witt.	Duty.
5	Berry, P., Corp'l, G, 23d Illinois, age 27.	June 21, 1864.	Fract. left humerus; elbow joint amp.	July 1, 1864.	Stump	July 1, 1864.	On face of stump...	Discharged December 5, 1864.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
6	Bettenhauser, C., Pt., I, 61st N. Y., age 22.	July 2, 1863.	Flesh; left arm	Aug. 12, 1863.	Brachial	Aug. 12, 1863.	One end in wound	V. R. C. May 13, 1864.
7	Bird, W. A., Pt., G, 68th Ind., age 32.	Aug. 14, 1864.	Fract. left humerus, lower third.	Sept. 9, 15, 1864.	Humeral	Sept. 9, 1864.	In continuity; hæm. Sept. 15.	Sept. 15, amp.; discharged November 26, 1864.
8	Bowman, G. W., Pt., C, 107th Illinois.	Aug. 6, 1864.	Left elbow, cut brachial artery.	Aug. 6, 1864.	Brachial	Aug. 6, 1864.	Both ends in wound	Discharged April 11, 1865.
9	Boynton, A. J., Pt., H, 13th Wis., age 23.	Nov. 21, 1864.	Fract. left humerus; Nov. 22, amp. arm.	Dec. 4, 7, 1864.	Brachial	Dec. —, 1864.	In continuity	Discharged April 8, 1865.
10	Brannagán, T., Pt., B, 22d Mass., age 19.	June 18, 1864.	Flesh; right arm	July 20, 24, '64.	Brachial	July 24, 1864.	One end in wound. A. A. Surg. H. Sanders.	V. R. C. May 2, 1865.
11	Brooks, J., Pt., E, 22d Mass., age 18.	July 2, 1863.	Fract. left humerus; amp. arm.	July 15, 1863.	Brachial	July 15, 1863.	In continuity	Recovery.
12	[1] *Broom, P.*, Serg't, A, 48th N. C.	Aug. 25, 1864.	Mid. finger left hand		Palmar arch	Aug. 30, 1864.	In continuity. Surg. P. Wright, P. A. C. S.	Recovery.
13	Budd, J., Pt., F, 100th Pa., age 22.	Mar. 25, 1865.	Fract. right humerus, lower third.	Apr. 2, 1865.	Superior profunda	Apr. 3, 1865.	In cont. Surg. N. R. Moseley, U. S. V.	Discharged June 27, 1865.
14	Caden, L., Pt., C, 8th New Jersey, age 19.	June 16, 1864.	Flesh; right arm, middle.	July 2, 1864.	Minor profunda	July 2, 1864.	One end in wound. A. A. Surg. W. Hooper.	Duty January 15, 1865.
15	Callahan, P., 4th N. J. Battery, age 26.	Aug. 16, 1864.	Brachial artery, right arm.		Brachial	Aug. 16, 1864.	In continuity; Sept. 1, 13, religated.	Discharged October 31, 1865.
16	Canning, W. J., Pt., D, 95th Pa., age 24.	Feb. 6, 1865.	Fract. left radius, up. third, wd. radial.		Radial		In continuity, middle third.	Discharged September 9, 1865.
17	Carnaghan, J., Pt., C, 29th Pa., age 21.	July 2, 1863.	Left hand	July 21, 1863.	Superficial palmar arch.	July 21, 1863.	In continuity, middle third.	V. R. C. Feb. 24, 1864.
18	Carr, S. H., Pt., C, 90th Ohio, age 21.	June 20, 1864.	Flesh; left arm, low. third.	July 12, 13, 1864.	Brachial	July 12, 1864.	In cont. A. A. Surg. D. J. Griffith.	July 13, amp.; disch. Sept. 23, 1864.
19	Carroll, J., Pt., E, 39th N. Y., age 28.	May 6, 1864.	Right brachial artery, high up.	May 12, 1864.	Brachial	May 12, 1864.	One end in cont. A. A. Surg. F. G. H. Bradford.	Discharged July 28, 1864.
20	Clark, O. A., Serg't, D, 21st Ohio, age 31.	July 9, 1864.	Flesh; left arm, middle.	July 24, 1864.	Brachial	July 24, 1864.	In cont. A. A. Surg. A. H. Hoy.	Discharged.
21	[2] Cloud, A., Pt., H, 22d Iowa, age 41.	May 22, 1863.	Fract. left humerus, lower third, amp.	Aug. 17, 1863.	Stump	Aug. 17, 1863.	On face of stump	Discharged Sept. 19, 1863.
22	Cole, N., Lieut., 20th Wisconsin.	Dec. 7, 1862.	Brachial artery, left arm.		Brachial	Dec. 16, 1862.	In continuity	Discharged Feb. 27, 1863.
23	Daniels, D., Pt., C, 3d Wis. Cav., age 30.	Oct. 16, 1864.	Flesh; right forearm	Repeated.	Diffused aneurism	Oct. 28, 1864.	In cont., mid. Surg. P. Harvey, U. S. V.	Discharged May 31, 1865.
24	David, W., Pt., D, 107th Illinois.	Aug. 18, 1864.	Brachial artery, bend of left elbow.		Brachial		Both ends in wound	Discharged July 2, 1865.
25	Davis, J. H., Pt., E, 39th C. T., age 21.	July 30, 1864.	Flesh; right hand			July 31, 1864.	In continuity, upper third.	Recovered Jan. 19, 1865.
26	Davis, W., Pt., E, 3d Artillery, age 24.	Feb. 20, 1864.	Flesh; left forearm	Mar. 7, 1864.	Ulnar and interosseous.	Mar. 7, 1864.	In cont., mid. A. A. Surg. J. T. Kennedy.	Duty Apr. 24, 1864.
27	Donnelly, J., Pt., D, 16th Mass., age 41.	May 12, 1864.	Flesh; left arm, upper brachial artery.	May 24, 1864.	Brachial	May 12, '64.	Both ends in wound. A. A. Surgeon E. G. Waters.	Discharged Jan. 10, 1865.
28	Downey, J. N., Pt., 6th Maine Battery, age 21.	June 18, 1864.	Right forearm			July 6, 1864.	In cont. A. A. Surg. G. E. Brickett.	Discharged June 3, 1865.
29	Duffy, H., Lieut., D, 155th N. Y., age 46.	June 3, 1864.	Brachial artery, left arm.		Brachial	July 13, 1864.	Ligation	July 21, amputated; disch. Oct. 11, 1864.
30	Ellis, D., Pt., A, 12th N. H., age 34.	May 3, 1863.	Right elbow; amp. arm.	June 29, 1863.	Brachial	June 29, 1863.	In continuity, high up.	Discharged Aug. 29, 1863.
31	Ells, W., Pt., K, 9th N. Y. Cav., age 20.	Aug. 1, 1863.	Flesh; left arm, lower third.	Aug. 11, 12, '63.	Branch brachial	Aug. 12, 1863.	In cont. A. A. Surg. J. E. Smith.	Duty Oct. 10, 1863.
32	Estes, H., Pt., H, 11th Ky., age 18.	June 9, 1863.	Flesh; right hand	June 13, 1863.	Palmar arch; lig. radial June 13.	June 19, 1863.	In continuity	Discharged Jan. 16, 1864.
33	Fisher, A., Corp'l, G, 36th Mass.	June 22, 1864.	Flesh; right arm	On field		On field	Ligation	Discharged Dec. 23, 1864.
34	Flewellen, A., Pt., I, 29th Ind., age 20.	Apr. 6, 1862.	Flesh; left hand	Apr. 20, 1862.	Palmar arch	Apr. 21, 1862.	In continuity	Discharged July 2, 1862.
35	Ford, I. C., Pt., C, 10th Mich., age 21.	Feb. 25, 1864.	Fracture left carpus	Mar. 25, 1864.	April 20, 21, recurred.	Apr. 21, 1864.	In continuity, lower third. A. A. Surg. D. O. Farrand.	Discharged Dec. 7, 1864.
36	Frank, P., Pt., D, 5th Minnesota, age 27.	Dec. 16, 1864.	Left arm, upper third.			Dec. 23, 1864.	Ligation	Duty Sept. 5, 1865.
37	Fritschey, W., S'gt, M, 12th Pa. Cav., age 24.	Mar. 21, 1865.	Flesh; left arm, middle third.	Apr. 23, 1865.	Brachial	Apr. 23, 1865.	In cont. Surg. J. B. Lewis, U. S. V.	Hæm. rec.; May 14, amputated; disch. June 27, 1865.
38	Gates, R., Pt, I, 4th N. Y., age 19.	Dec. 13, 1862.	Fracture left wrist joint.	Jan. 13, 1863.	Ulnar	Jan. 13, 1863.	In cont. at bend of elbow.	Furloughed.
39	Gilboa, A., Pt., C, 8th Mich. Cav., age 27.	Jan. 29, 1864.	Left elbow joint		Brachial	Feb. 11, 1864.	Both ends in cont. A. A. Surg. H. C. May.	Discharged Nov. 14, 1864.
40	*Giltard, M.*, Pt., K, 16th Miss., age 27.	Aug. 24, 1864.	Flesh; through biceps.		Brachial	Sept. 7, 1864.	Both ends in wound. A. A. Surg. J. Morris.	To prison Feb. 5, 1865.
41	Girrbach, A., Pt., B, 5th Penn. Cav., age 26.	June 25, 1864.	Flesh; right wrist	Sept. 5, 14, '64.	Ulnar ligated Sept. 5.	Sept. 15, 1864.	In continuity, mid. A. Surgeon J. H. Merriam, U. S. V.	Discharged May 16, 1865.
42	Goodwin, A. K., Pt., I, 4th N. H., age 23.	May 16, 1864.	Right arm fractured amp.	June 21, 1864.	Brachial	June 21, 1864.	Both ends in continuity.	Discharged Sept. 23, 1864.
43	Grady, J., Pt., C, 164th N. Y., age 47.	June 16, 1864.	Flesh; right arm	July 2, 4, 1864.	Brachial	July 4, 1864.	Both ends in wound. Assist. Surgeon H. S. Schell, U. S. A.	Discharged Feb. 6, 1865.
44	Graham, R., Pt., B, 81st Penn., age 43.	July 1, 1862.	Radial artery, left forearm, up.	Prim. and recurring.	Radial	July 9, 1862.	In continuity, lower third.	Discharged Dec. 9, 1862.
45	Griggs, E. P., Pt., F, 14th Inf., age 21.	Aug. 30, 1862.	Fractured metacarpal, right hand.	Sept. 26, 1862.		Sept. 26, 1862.	Radial, ulnar, and brachial in cont.	Discharged Nov. 10, 1862.
46	[3] Hamilton, J., Pt., I, 51st Penn., age 22.	Jan. 1, 1862.	Left hand, fract. met. Jan. 1, excision.	Jan. 10, 15, Mar. 1, 1862.	Palmar arch; lig. radial Jan. 10.	Jan. 23, Mar. 1, 1862.	In continuity	Recovered March —. 1862.

136	Hamlin, F. N., Lt., K, 147th N. Y., age 32.	May 5, 1864.	Fracture left forearm, ulnar artery divided.	June 5, 1864.	Ulnar	June 5, 1864.	In cont'ty; after lig. ulnar. Surg. H. W. Ducachet, U. S. V.	Died June 25, 1864; exhaustion.
137	[1]*Hardy, F. S.*, Pt., B, 30th N. C., age 22.	July 12, 1864.	Fracture left ulna and right radius.	Aug. 13, 1864.	Right brachial	Aug. 13, 1864.	In cont'ty; slough.; hæm. recurred.	Died Aug. 14, 1864; exhaustion.
138	Heatherly, J., Pt., E, 11th W. Va., age 35.	Oct. 28, 1864.	Fracture left forearm, upper third; Oct. 29, excision.	Dec. 10, 16, 19, 1864.	Brachial	Dec. 19, 1864.	In continuity, above bifurcation; hæm. recurred.	Jan. 4, 1865; amputation. Died Jan. 21; pyæmia.
139	Hendrix, A., Pt., C, 140th N. Y.	July 2, 1863.	Fracture right elbow joint.	July 26, Aug. 2, 1863.	.....	Aug. 4, 1863.	In wound; hæmorrhage recurred Aug. 14, 16.	Died Aug. 18, 1863.
140	Howard, G., Pt., H, 8th N. Y. Heavy Artillery, age 20.	June 3, 1864.	Fracture right forearm.	June 29, 1864.	Brachial	June 29, 1864.	Both ends in wound	Died July 1, 1864; exhaustion.
141	Iler, W. S., Bugler, D, 15th Ohio, age 22.	May 27, 1864.	Fracture right arm, elbow; amp.	Sept. 6, 1864.	Brachial	Sept. 6, 1864.	On face of stump ...	Died Sept. 16, 1864.
142	Johnson, O., Pt., C, 33d Iowa.	July 4, 1863.	Flesh; right forearm.	July 30, Aug. 5, 1863.	Radial and ulnar..	Aug. 5, 1863.	In continuity	Died Aug. 13, 1863.
143	Jones, J., Pt., A, 143d Penn., age 28.	July 1, 1863.	Frac. right wrist; amputation.	July 17, 1863.	Brachial	July 17, 1863.	In continuity	Died July 18, 1863.
144	*Kane, J. F.*, Pt., D, 27th Georgia.	June 1, 1864.	Fracture humerus, upper third; amputation.	June 13, 16, 1864.	Brachial	June 15, 16, 1864.	In continuity	Died June 16, 1864.
145	Lake, J. F., Corp'l, A, 14th N. J., age 44.	Nov. 27, 1863.	Fracture left humerus; amp.	Dec. 15, 1863.	Brachial	Dec. 15, 1863.	In continuity; Dec. 24, lig. sup. prof.	Died Dec. 25, 1863.
146	Lamareaux, A., Corporal, E, 14th N. Y., age 20.	April 1, 1865.	Fracture left radial, upper third; radial artery severed.	Apr. 9, 12, 15, 1865.	.....	Apr. 15, 1865.	In continuity	Died April 16, 1865; exhaustion. *Spec.* 4186.
147	Lanoni, C., Pt., I, 9th N. H., age 23.	Sept. 13, 1864.	Right arm.....	Oct. 10, 1864.	Brachial	Oct. 10, 1864.	One end in wound. A. A. Surg. G. Sweet.	Died Nov. 13, 1864; chronic diarrhœa.
148	Marshall, H., Pt., E, 1st Mich. C., age 20.	May 28, 1864.	Flesh; right arm ...	June 19, 1864.	Radial and ulnar..	June 19, 1864.	In continuity; hæmorrhage recurred.	June 24, 1864, amp. Died July 11, 1864; pyæmia.
149	McCriden, B., Pt., D, 63d N. Y., age 30.	June 16, 1864.	Fracture left humerus; 23d, exc. sh. jt.	June 29, 1864.	.....	June 29, 1864.	Ligation	Died July 8, 1864.
150	Morgan, L., Pt., D, 14th Mich. age 22.	Mar. 25, 1865.	Flesh; left arm, middle third.	April 8, 1865.	Brachial	April 8, 1865.	Both ends in wound.	Died April 13, 1865; pyæmia.
151	Mullan, P., disch'd soldier, age 30.	Jan. 29, 1862.	Inj. humerus and thoracic parietes.	Oct. 20, 1862.	Brachial	Oct. 20, 1862.	Ligation	Oct. 21, amputated; died Nov. 5, 1862.
152	Nash, J. E., Pt., B, 9th N. Y. A., age 25.	July 9, 1864.	Left elbow joint; amputation.	Aug. 2, 1864.	Brachial	Aug. 2, 1864.	On face of stump....	Died Aug. 7, 1864; pneumonia.
153	*Nunn, T. P.*, Pt., F, 12th Ga.	.....	Right elbow, cutting brachial.	.....	.....	....	In continuity	Died June 20, 1864.
154	Palmer, U., Pt., B, 4th Art.	July 1, 1863.	Left arm.....	July 12, 16, 1864.	Brachial; July 12, amp. arm.	July 16, 1864.	On face of stump....	Died July 21, 1864.
155	Parmenter, R. B., Pt., A, 21st Mich., age 32.	Dec. 16, 1862.	Left hand	.....	.....	Dec. —, 1862.	In continuity near elbow.	Died Jan. 1, 1863; mortification.
156	Rea, J. H., Pt., H, 102d Penn., age 17.	May 5, 1864.	Left arm, upper third.	.....	Brachial	May —, 1864.	Ligation	May 17, amputated; died Dec. 1, 1864; phth. and diar.
157	Reagles, L., Pt., A, 64th N. Y., age 20.	Oct. 14, 1864.	Arm nearly severed at middle; amputated in upper third	Oct. 18, 1864.	Brachial	Oct. 18, 1864.	In continuity at axilla. A. A. Surg. C. P. Bigelow.	Died Oct. 20, 1864; recur. of hæm.
158	Rees, G. W., Pt., G, 20th Pa. C., age 22.	April 1, 1865.	Fracture left radius, middle third.	Apr. 12, 1865.	Radial	Apr. 12, 1865.	In cont. A. A. Surg. J. Morris.	Died April 26, 1865; pneumonia.
159	Richardson, O. B., Serg't, E, 32d Me., age 21.	June 3, 1864.	Fracture right radius.	July 1, 1864.	.....	July 5, 1864.	Both ends in cont. Surg. E. Russell, Farmington, Me.	July 15, amputated; died Aug. 23, 1864.
160	Roberts, J., Corp'l, H, 24th N. Y. Cav.	June 3, 1864.	Right arm, lower third.	.....	....	June 28, 1864.	Ligated	Died July 8, 1864; pyæmia.
161	Satterfield, E., Pt., F, 12th W. Va.	Apr. 2, 1864.	Left elbow joint; amputation arm.	Aug. 6, 1864.	Brachial	Aug. 6, 1864.	On face of stump....	Died August 7, 1864; pyæmia.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
162	Slater, J., Corp'l, K, 7th New York Artillery, age 20.	June 16, 1864.	Fracture right radius and ulna, mld.; amputation.	June 30, 1864.	Radial and ulnar	June 30, 1864.	In continuity	Died July 8, 1864. *Spec.* 2700.
163	Tipton, J., Pt., C, 78th Illinois, age 30.	Sept.—, 1862.	Left wrist joint	Oct. 15, 1862.		Oct. 15, 1862.	In continuity; Oct. 17, amputation.	Disch'g'd; died Nov. 30, 1862; lung fever.
164	Urmston, J., Pt., K, 86th Indiana.	Sept. 19, 1863.	Thro' carpus right hand; amputation.			Oct. 20, 1863.	In continuity at lower third.	Died October 21, 1863.
165	Vandersliee, J., Pt., D, 96th Pennsylvania, age 49.	June 3, 1864.	Flesh; arm	June 14, 1864.	Brachial	June 14, 1864.	One end in wound. A. A. Surg. D. Kendy.	Died July 16, 1864; pyæmia.
166	Waite, W., Pt., E, 53d Ohio.	May 31, 1864.	Flesh; right arm, upper third; brachial artery cut.	May 31, 1864.	Brachial	May 31, 1864.	Ligated. Surg. J. N. Barnes, 116th Illinois.	Died May 31, 1864; effect of chlorof'm.
167	Walker, H. H., Pt., A, 27th New York, age 29.	June 27, 1862.	Flesh; middle third arm.	Aug. 3, 1862.		Aug. 3, 1862.	Ligation	Died August 3, 1862.
168	*Walker*, W., Pt., C, 18th Georgia.	1863.	Fracture humerus				Ligation; hæm. rec. December 10.	Died December 11, 1863.
169	Williamson, J., Corporal, F, 111th Illinois, age 26.	Dec. 13, 1864.	Right forearm, injuring ulnar artery.	Dec. 30, 1864.	Ulnar	Jan 2, 1865.	In continuity. A. A. Surg. H. Leaman. Jan. 6, re-ligated.	January 7, amputation. Died February 1, 1865; pyæmia.
170	Wolfe, F., Pt., N, 9th New York Artillery, age 28.	Oct. 19, 1864.	Flesh; injuring brachial artery.	Oct. 29, 1864.	Brachial	Oct. 29, 1864.	Both ends in wound. A. A. Surg. H. L. Snyder.	Died November 14, 1864, of pyæmia.

Of the one hundred and seventy cases amputation of the arm had been performed in twenty-nine, and the subsequent ligations were on the face of the stump in ten and in the continuity in nineteen instances. Hæmorrhages recurred after ligations in thirty-eight instances, causing fatal terminations in sixteen cases.

Ligations of Branches of the Brachial Artery.—These include three cases of ligations of muscular branches (one recovery, two fatal), seven ligations of the profunda (five recoveries, two deaths), and a fatal case of ligation of the anastomotica magna:

Ligations of Muscular Branch of Brachial Artery.—Cases 1133–1135.—Private R. Richards, G, 4th New Hampshire, aged 29; shell wound of right elbow February 21, 1865; amputation of arm on same day; hæmorrhage March 27; muscular branch ligated on face of stump; discharged June 11, 1865.—Private W. Fitzgerald, B, 1st U. S. Sharpshooters, age 19; shot fracture of elbow joint November 7, 1863; excision November 8, 1863; amputation of arm November 12th; hæmorrhage November 24th from muscular branch; ligation on face of stump by Assistant Surgeon W. F. Norris, U. S. A.; death from pyæmia November 29, 1863.—Lieut. D. A. Walbridge, A, 11th Vermont, age 31; shot fracture of right humerus June 4, 1864; amputation of arm on same day; hæmorrhage June 18th; ligation of muscular branch on face of stump; hæmorrhage recurred; artery re-ligated; death June 19, 1864, from exhaustion.

Ligations of Profunda Arteries.—Cases 1136–1142.—Private G. C. Figgens, 8th Illinois, age 25; right shoulder joint April 9, 1865; excision of neck of humerus same day; hæmorrhage from profunda May 9th; ligation in wound May 9th; no recurrence; discharged July 22, 1865.—Private E. Getchell, C, 3d Maine, age 29; shot fracture of left arm May 5, 1864; amputation of arm May 6th; hæmorrhage from profunda May 9th; ligation on face of stump; discharged December 13, 1864.—Private G. Johnson, I, 9th U. S. Colored Troops; shot fracture of right humerus September 29, 1864; hæmorrhages October 16–26; excision of head of humerus and ligation of profunda; discharged December 9, 1865.—Corporal A. C. Vantine, B, 123d Ohio, age 23; shot wound of right elbow September 22, 1864; amputation of arm October 12th; hæmorrhage from profunda October 16th; ligation on face of stump; no recurrence; discharged February 21, 1865.—Private L. G. Williams, H, 84th Illinois, age 30; flesh wound of arm September 19, 1863; hæmorrhage from profunda October 8th; ligation of cardiac end in wound October 8th; no recurrence; discharged February 28, 1865.—Private J. P. Wells, E, 104th New York, age 19; flesh wound of arm July 1, 1863; hæmorrhage from profunda July 7th; ligation July 9th; death July 20, 1863.—Private J. Woods, C, 85th Pennsylvania, age 23; fracture of left humerus September 2, 1863; amputation of arm September 9, 1863; hæmorrhage from profunda September 12th; artery ligated on face of stump; death September 17, 1863, from exhaustion.

Ligation of Anastomotica Magna.—Case 1143.—Corporal J. Foster, K, 38th Illinois; flesh wound of arm September 19, 1863; hæmorrhage from anastomotica magna September 29th; wound enlarged and artery ligated same day; gangrene October 7th; death from exhaustion October 9, 1863.

Ligations of the Radial Artery.—Fifty-nine cases with forty-five recoveries and fourteen deaths were reported, a fatality rate of 23.7 per cent. In four cases, of which one proved successful and three fatal, the ulnar artery was also ligated. The ligation was performed after amputation in the forearm in seven instances; in three cases of recovery on the face of the stump; and in four cases, with two recoveries and two deaths, in the continuity. In four instances primary ligation was performed on the field; all recovered.

TABLE CXXXIV.

Condensed Summary of Fifty-nine Ligations of the Radial Artery for Shot Injury.

[Recoveries, 1—45; Deaths, 46—59.]

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
1	Blackney, J., Pt., G, 63d Penn., age 40.	June 16, 1864.	Fracture right radius.	June 28, 1864.	Radial artery.....	June 28, 1864.	Right; both ends in wound. Act. Asst. Surg. C. Eberhardt.	Discharged July 7, 1865.
2	Brown, D., Pt., I, 7th West Va. Cavalry.	Nov., 1864.	Wound left hand....	.....	.....	Nov., 1864.	Left; radial ligated.	Mustered out Aug., 1865.
3	Clough, A., Pt., C, 31st Maine, age 18.	June 3, 1864.	Fracture right radius.	June 8, 1864.	Radial artery.....	June 8, 1864.	Right; both ends in cont. Act. Asst. Surg. C. Eberhardt.	Veteran Reserve C. Feb. 18, 1865.
4	Cottrell, C. H., Pt., I, 7th N. J., age 18.	May 12, 1864.	Fracture left radius.	.....	.....	.....	Left. A. Surg. H. M. Sprague, U. S. A.	Duty Oct. 17, 1864.
5	Dieffenbach, H., Lt., I, 111th Pa., age 30.	July 20, 1864.	Fracture right radius; excision.	July 20, 1864.	Radial.....	July 20, 1864.	Right. Surg. A. K. Fifield, 29th Ohio.	Discharged Nov. 3, 1864.
6	Engle, G. D., Pt., A, 28th Mich., age 18.	Mar. 10, 1865.	Fracture left radius; excision.	Mar. 18, 1865.	Radial.....	Mar. 18, 1865.	Left; radial ligated..	Discharged July 20, 1865.
7	Fairfield, E. F., Corp'l, D, 74th N. Y.	Aug. 29, 1862.	Fracture left hand; amputation finger.	.....	.....	.....	Rad. and ulnar art. in cont., lower third.	Discharged Oct. 31, 1862.
8	Fisher, R., Pt., K, 121st N. Y., age 18.	May 10, 1864.	Flesh wounds right forearm and arm.	June 7, 1864.	Radial.....	June 7, 1864.	Right; both ends in wound. Act. Asst. Surg. A. A. Smith.	Discharged Dec. 10, 1864.
9	Gaunt, B., Pt., A, 12th N. J., age 26.	June 5, 1864.	Fracture right forearm; amputation.	June 30, 1864.	Radial.....	June 30, 1864.	Right; on face stump.	Discharged Oct. 26, 1864.
10	Gracey, A., Pt., E, 52d Ohio, age 40.	July 1, 1864.	Flesh wound left forearm.	July 20, 1864.	Radial.....	July 20, 1864.	Left; both ends in wound.	July 22, amp. arm. Disch'd May 2, 1865.
11	Greenly, H., Pt., K, 34th New York.	June 30, 1862.	Shell wound right wrist.	July 15, 1862.	.....	July 18, 1862.	Right; in continuity.	Discharged Jan. 10, 1863.
12	Hakes, A., Pt., A, 32d N. Y., age 23.	Sept. 17, 1862.	Fracture right radius.	Oct. 9, 1862.	Radial artery.....	Oct. 9, 1862.	Right; one end in wound.	Duty Feb. 13, 1863.
13	Hall, J. M., Pt., E, 20th Illinois.	April 6, 1862.	Fracture right radius.	.....	.....	....	Right; radial ligated.	Discharged Aug. 28, 1862.
14	Hannaberry, W. A., Pt., A, 26th Penn., age 20.	July 2, 1863.	Fracture left ulna...	July 19, 1863.	Radial artery.....	July 19, 1863.	Left; one end in wound.	Discharged Feb. 9, 1864.
15	Harding, H. S., Capt., A, 122d Ohio, age 42.	June 3, 1864.	Fracture left radius.	June 3, 1864.	Radial artery.....	June 3, 1864.	Left; on field.	Discharged Oct. 27, 1864.
16	Hart B., Pt., D, 28th Mass., age 38.	July 3, 1863.	Fracture bones right hand.	July 4, 1863.	Radial artery.....	July 4, 1863.	Right; in continuity.	Discharged Feb. 28, 1864.
17	Hathaway, L., C'p't, I, 25th Mass., age 25.	June 2, 1864.	Flesh wound left forearm.	June 6, 1864.	.....	June 13, 1864.	Left; in cont. Surg. E. Bentley, U. S. V.	Discharged Oct. 27, 1864.
18	Hayden, J., Corp'l, H, 17th Wis., age 25.	Aug. 22, 1864.	Fracture left hand and wrist.	Sept. 9, 1864.	Radial artery.....	Sept. 9, 1864.	Left; in cont. Surg. J. G. Miller, 11th Iowa.	Discharged May 5, 1865.
19	Hulse, S., Pt., I, 84th Penn., age 27.	May 15, 1864.	Flesh wound, injuring right rad. art.	May 26, 1864.	Radial artery.....	May 26, 1864.	Right; in cont.; both ends. Act. Asst. Surg. J. Evans.	Deserted October 16, 1864.
20	Lamper, C., Pt., F, 82d Penn., age 21.	June 1, 1864.	Fracture left ulna...	July 27, 1864.	Radial artery.....	July 27, 1864.	Left; both ends in wound. Act. Asst. Surg. W. F. Atlee.	Discharged May 17, 1865.
21	Lewis, E. H., Pt., E, 145th Penn., age 18.	Dec 13, 1862.	Frac. left carpus j't; excis.; amp. forearm.	Mar. 7, 1863.	Radial artery.....	Mar. 7, 1863.	Left; in continuity..	Discharged June 13, 1864.
22	McIsaacs, J., Corp'l, G, 5th Mich., age 21.	May 10, 1864.	Flesh wound left forearm.	May 24, 1864.	Radial artery.....	May 24, 1864.	Radial; both ends in wound. Act. Asst. Surg. W. R. Dunton	Duty Aug. 12, 1864.
23	McMullin, S., Serg't, A, 14th Penn. Cavalry, age 43.	Sept. 18, 1864.	Fracture right carp. bones.	Oct. 18, 1864.	Radial artery	Oct. 18, 1864.	Right; both ends in wound. A. A. Surg. J. M. McGrath.	Oct. 21, amputation forearm. Disch'd Aug. 21, 1865.
24	Miller, I., Pt., K, 97th Penn., age 25.	May 20, 1864.	Flesh wound left forearm.	.....	.....	June 12, 1864.	Left; both ends in wound. A. A. Surg. T. Liebold.	Vet. R. Corps April 12, 1865.
25	Nevins, H. M., Serg't E, 25th New York Cavalry, age 23.	July 11, 1864.	Wound right wrist, rad. art. severed.	July 11, 1864.	Radial artery	July 11, 1864.	Right; in continuity. Aug. 1, 2, hæm., palm. arch.	Aug. 2, amputation forearm. Disch'd May 18, 1865.
26	O'Brien, M., Pt., I, 169th N. Y., age 24.	June 30, 1864.	Flesh wound left forearm.	July 14, 1864.	Radial artery	July 15, 1864.	Left; both ends in wound. Asst. Surg. E. Curtis, U. S. A.	Aug. 2, amputation arm. Discharged Feb. 11, 1865.
27	O'Donnell, E., Pt., C, 3d Pa. Art., age 20.	July 3, 1863.	Fracture left ulna...	July 21, 1863.	Radial artery	July 21, 1863.	Left; in continuity..	Discharged May 16, 1864.
28	Perkins, G. W., Pt., G, 8th Mich., age 25.	Aug. 19, 1864.	Fracture left wrist; amp. forearm.	Oct. 9, 1864.	Radial artery	Oct. 9, 1864.	Left; in continuity..	Discharged Jan. 17, 1865.
29	Ray, D., Pt., I, 5th Conn., age 22.	May 25, 1864.	Flesh wound left forearm.	July 22, 1864.	Musc. branch radial artery.	July 22, 1864.	Left; both ends in wound.	Duty Jan. 26, 1865.
30	Reichneider, P., Pt., H, 28th Penn., age 24.	July 20, 1864.	Fracture left wrist joint; amputation; forearm re-amp.	June 16, 1865.	Radial artery	June 16, 1865.	Left; on face of stump	Discharged Sept. 9, 1865.
31	Richards, G. W., Pt., A, Vet. Res. Corps.	Sept. 3, 1864.	Fracture right wrist and hand; amputation forearm.	Sept. 10, 1864.	Radial artery	Sept. 10, 1864.	Right; in wound; one end.	Discharged July 2, 1865.
32	Rose, G. M., Pt., G, 6th Cavalry, age 22.	Mar. 29, 1864.	Fracture ulna, radial artery injured.	Apr. 2, 1864.	Radial artery	Apr. 7, 1864.	One end in wound. A. A. Surg. W. P. Wolhaupter.	Duty July 12, 1864.
33	Smith, J., Pt., K, 119th Pa., age 22.	Nov. 7, 1863.	Fracture right rad. at wrist.	Nov. 20, 1863.	Radial artery	Nov. 20, 1863.	Right; in cont. A. A. Surg. J. Stearns.	Discharged.
34	Smith, S., Pt., H, 71th Ohio, age 36.	Oct. 2, 1863.	Fracture left radius.	Oct. 26, 1863.	Radial artery.	Oct. 26, 1863.	Left. A. A. Surg. J. Grant.	Duty Sept. 7, 1864.
35	Swords, J. W., Serg't, H, 26th Iowa.	Mar. 20, 1865.	Fracture left radius; resection.	.....	.....	Mar. 20, 1865.	Left radial artery lig.	Discharged June 6, 1865.
36	Tate, W. C., Pt., B, 56th Illinois.	Oct. 4, 1862.	Flesh wound right fore'm, rad. art. sev.	Oct. 4, 1862.	Radial artery	Oct. 4, 1862.	Right; in wound....	Duty Nov. 11, 1862.
37	Thomas, J., Pt., G, 75th Illinois, age 22.	Oct. 8, 1862.	Flesh; right forearm.	Oct. 20, 1862.	Radial artery	Oct. 20, 1862.	Right; both ends in wound.	Discharged Dec. 7, 1862.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
38	Thompson, W. M., Pt., E, 1st Maryland, age 24.	June 3, 1864.	Flesh; left forearm, inj. rad. art.	June 11, 1864.	Radial	June 12, 1864.	Left; both ends in wound. Surg. E. Bentley, U. S. V.	Duty Sept. 19, 1864.
39	Van Kirk, P., Pt., A, 26th Penn., age 21.	July 2, 1863.	Fracture left ulna ..	July 22, 1863.	Radial artery	July 22, 1863.	Left; one end in wound.	Duty May 3, 1864.
40	Washington, M., Pt., K, 8th Colored Troops, age 30.	Aug. 16, 1864.	Fracture left wrist..	Sept. 9, 1864.	Radial artery	Sept. 9, 1864.	Rad. tied in wound..	Discharged May 26, 1865.
41	White, P., Pt., B, 22d Mass., age 42.	July 2, 1863.	Flesh wound left hand.	July 10, 1863.	Dorsal artery	July 10, 1863.	Left; in continuity..	Recovered. Killed June 3, 1864.
42	Wiggins, H., Pt., I, 20th Mass., age 31.	Feb. 26, 1863.	Fracture left carpus; excis.	Mar. 9, 1863.	Recurred March 10, 11, 12.	Mar. 12, 1863.	Left; in continuity..	Discharged Dec. 29, 1863.
43	Woodruff, J., Pt., A, 27th Mich., age 33.	June 18, 1864.	Fracture fingers left hand; amputation.	July 3, 1864.	Radial	July 3, 1864.	Left; on face stump	Transferred July 28, 1864.
44	Wright, W. C., Corp'l, F, 107th N. York, age 21.	July 20, 1864.	Flesh wound right forearm, rupturing radial artery.	.....	Radial	Aug. 5, 1864.	Right; in wound. A. A. Surg. S. W. Blackwood.	Duty July 13, 1865.
45	Wrightman, G., Sgt., L, 6th Mich. Cav., age 23.	May 28, 1864.	Flesh wounds left hand and thigh.	June 27, 28, '64.	Radial artery	June 28, 1864.	Left; one end in wound.	Furloughed Aug. 19, 1864.
46	Beach, H. M., Serg't, C, 5th Minn., age 31.	Dec. 16, 1864.	Flesh wound right arm, inj. rad. and uln. arteries.	Jan. 10, 1865.	Radial and ulnar arteries.	Jan. 10, 1865.	Right; rad. and uln. arteries tied, one end in wound. A. A. Surg. J. Sloan.	Died Jan. 27, 1865; jaundice, etc.
47	Daniels, L., Pt., B, 69th N. Y., age 26.	Mar. 25, 1865.	Flesh wound left forearm and chest.	.....	Radial artery.....	.....	Left; both ends in wound.	Died April 12, 1865, of asthma.
48	Frantz, P., Corp'l, H., 148th Penn., age 21.	May 10, 1864.	Fracture left forearm.	.....	Radial artery.....	May 30, 1864.	Left; rad. art. and musc. branch. A. A. Surg. A. A. Smith.	Died Sept. 3, 1864; pharyngitis.
49	Grundy, J. N., Corp., F, 98th N. York, age 21.	Sept. 29, 1864.	Flesh wound left arm.	Oct. 9, 13, '64.	Radial and inter. arteries.	Oct. 16, 1864.	Left; one end in wound.	Died Oct. 26, 1864.
50	Humphrey, J. M., Pt., B, 183d Penn., age 32.	May 18, 1864.	Wound left hand; amp. fingers.	May 23, 1864.	Radial artery.....	May 23, 1864.	Left; in continuity..	Died June 8, 1864.
51	Jackson, T., Pt., B, 95th N. Y., age 19.	Feb. 7, 1865.	Fracture left radius; wounds both hands.	Feb. 21, 1865.	Radial artery.....	Feb. 21, 1865.	Left; in continuity...	Feb. 21, amp. forearm. Died April 8, 1865; pyæmia.
52	Knock, A., Serg't, B, 84th Ill., age 26.	June 27, 1864.	Flesh wound left forearm.	July 22, 1864.	Radial artery.....	July 22, 1864.	Left; one end in wound.	July 24, amp. arm. Died Oct. 11, 1864; diarrhœa.
53	Kuhn, J. G., Pt., G, 75th Pa., age 42.	July 3, 1863.	Fracture left hand; amp. fing.	July 24, 1863.	Radial artery.....	July 24, 1863.	Left; both ends in wound.	July 29, amp. forearm. Died August 19, 1863; pyæmia. *Specs.* 2615, 2616, 2773, A. M. M.
54	McCready, J. S., Captain, H, 126th Ohio, age 35.	May 10, 1864.	Fracture left ulna; exc. ulna May 20.	May 19, 1864.	Radial artery.....	May 20, 1864.	Left; both ends in wound. Surg. N. R. Moseley, U. S. V.	July 6, amp. forearm. Died Sept. 7, 1864; pyæmia. *Spec.* 2810, A. M. M.
55	Merrick, T., Serg't, F, 102d Ill., age 35.	Oct. 20, 1864.	Fracture left radius; wound left hip.	Nov. 6, 1864.	Radial artery	Nov. 6, 1864.	Left; in continuity..	Nov. 6, amp. arm. Died Nov. 15, 1864; exhaustion.
56	Palmer, A., Pt., K, 73d Ohio, age 40.	July 3, 1863.	Flesh wound forearm	July 29, 1863.	Radial	July 29, 1863.	One end tied in wound.	July 29, amp. forearm. Died July 31, 1863.
57	Pohlman, W. H., Adjutant, 59th N. Y.	July 3, 1863.	Wounds r't forearm and left shoulder.	.....	.....	July —, 1863.	Right; radial ligated	Died July 21, 1863.
58	*Strickland, M. P.*, —, G, 50th Ga., age 22.	Sept 14, 1862.	Fracture left radius; amp. forearm.	Oct. 20 1862.	Radial and ulnar arteries.	Oct. 20, 1862.	Left; radial and ulnar arteries in continuity.	Died Dec. 3, 1862; pyæmia. *Spec.* 217, A. M. M.
59	Washburn, J., Pt., H, 38th Ind.	Sept 19, 1863.	Fracture met. bone right thumb; amp.	Oct. 3, 1863.	.....	Oct. 3, 1863.	Right; radial and ulnar arteries ligated.	Oct. 26, amp. forearm. Died Oct. 29, 1863; pyæmia.

Ligations of the Ulnar Artery.—There were twenty-two cases of ligation of this artery with two deaths, the fatal issue being ascribed to hæmorrhage in one instance and to exhaustion following hæmorrhage in the other. In a case of aneurism of the ulnar artery both ends of the vessel were ligated in the wound; the bleeding did not recur, and the patient recovered without further untoward accident.

Table CXXXV.

Condensed Summary of Twenty-two Ligations of the Ulnar Artery for Shot Injuries.

[Recoveries, 1—20: Deaths, 21—22.]

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
1	Black, J. A., Capt., B, 56th Pa., age 36.	May 23, 1864.	Fracture left ulna; excision.	May —, 1864.	.....	May 28, 1864.	Left; in wound ...	Discharged July 1, 1865.
2	Booth, G. W., Pt., F, 1st Mich., age 26.	Aug. 21, 1864.	Flesh wound; left forearm.	Sept. 6, 7, '64.	Aneurism of ulnar artery.	Sept. 7, 1864.	Left; both ends in wound. A. Surg. H. Allen, U. S. A.	Discharged Feb. 25, 1865.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
3	Bruso, T., Pt., A, 121st N. Y., age 21.	Apr. 6, 1865.	Fracture left radius.	May 14, 1865.	Ulnar artery	May 14, 1865.	Left; both ends in wound.	Discharged Aug. 1, 1865.
4	Carter, J., Pt., D, 11th Conn., age 22.	May 16, 1864.	Flesh wound right forearm.	June 2, 1864.	Ulnar artery	June 2, 1864.	Right; in wound. A. A. Surg. O. W. Peck.	Discharged Dec. 21, 1864.
5	Copley, J. G., Capt., E, 86th N. Y.	May 6, 1864.	Fract. left forearm; excision.	May 22, 1864.	Ulnar artery	May 22, 1864.	Left; in wound	May 23, amp. arm. Disch. Sept. 19, 1864.
6	Cranshaw, S., Pt., B, 70th N. Y., age 45	May 31, 1864.	Fracture left radius and ulna; excision.	.....	.....	June 18, 1864.	Left; amp. forearm same day.	Discharged Sept. 13, 1864.
7	Eiger, J. H., Pt., F, 28th Mass., age 20.	May 6, 1864.	Fracture left hand.	May 21, 1864.	.....	May 21, 1864.	Left; ulnar tied; excision.	May 28, amp. forea'm. Disch. Apr. 16, 1865. *Spec.* 2477, A. M. M.
8	Fallon, P., Pt., I, 146th N. Y., age 22.	Dec. 13, 1862.	Wound of wrist joint.	Dec. 24, 1862.	Ulnar artery	Dec 24, 1862.	Left; in continuity..	Discharged Apr. 23, 1863
9	Ford, M., Pt., G, 51st N. Y., age 28.	Sept. 17, 1862.	Fracture of ulna	Oct. 2, 1862.	Ulnar artery	Oct. 3, 1862.	Left; both ends in wound.	Discharged Feb. 2, 1863.
10	Fox, W. H., Pt., F, 16th Wis., age 18.	Aug. 20, 1864.	Fracture of left ulna.	.....	.....	.....	Ligation of ulnar....	Discharged Mar. 22, 1865.
11	*Freeman, J. N.*, Capt., H, 58th Va., age 36.	Sept. 19, 1864.	Flesh w'd right forearm, ulnar severed.	Sept. 19, 1864.	Ulnar	Sept. 19, 1864.	Lig. in wound. Surg. C. W. Todd, 13th Va.	Exchanged Oct. 25, 1864.
12	Harbison, G., Pt., L, 2d Pa. H. A., age 32.	Sept. 29, 1864.	Wound of right forearm.	Nov. 1, 1864.	Ulnar artery	Nov. 1, 3, '64.	Liga. both ends in cont. A. Surg. W. S. G. Elliott, U. S. V.	Duty Dec. 22, 1864.
13	Harrison, W. H., Pt., M, 1st U. S. Art., age 22.	Feb. 20, 1864.	Fracture of left ulna	Mar. 1, 1864.	Distal end of ulnar.	Mar. 1, 1864.	Both ends in wound. Surg. C. L. Allen, U. S. A.	Duty July 12, 1864.
14	*Howell, S. W.*, Pt., E, 6th N. C., age 20.	July 3, 1863.	Fracture of ulna ...	July 13, 1863.	.....	July 13, 1863.	Left; ulnar ligated..	Recovery.
15	Kripps, J. B., Pt., E, 2d Pa. Art., age 40.	Sept. 29, 1864.	Fracture of ulna ...	Oct. 8, 1864.	Ulnar artery	Oct. 8, 1864.	Left; both ends in wound.	Returned to duty Mar. 31, 1865.
16	McColliff, J., Pt., B, 2d Ill. Cav., age 28.	Aug. 11, 1864.	Fracture of radius...	Aug. 24, 1864.	Ulnar artery; 40 oz	Aug. 24, 1864.	One end in w'd. Surg. D. C. Jones, 2d Ill. C.	Returned to duty Nov. 25, 1864.
17	Price, L. H., Pt., G, 86th N. Y.	Aug. 30, 1862.	Fracture of ulna	Sept. 15, 1862.	Ulnar artery; 18 oz.	Sept. 15, 1862.	In continuity	Discharged Dec. 29, 1862.
18	Shaw, G. W., Pt., H, 85th Pa., age 42.	May 20, 1864.	Wound of left arm; gangrene.	June 12, 1864.	.....	June 12, 1864.	Ligation. Act. Asst. Surg. W. C. Pryer.	Discharged Nov. 12, 1864.
19	Wartenbee, W. D., Pt., 100th O., age 23.	Feb. 20, 1865.	Flesh wound right forearm.	Mar. 26, 1865.	Ulnar artery; 20 oz.	Mar. 26, 1865.	Both ends in wound. A. A. Surg. G. Byers.	Discharged July 5, 1865.
20	Wood, D. E., Pt., K, 64th N. Y., age 33.	July 3, 1863.	Fract. of right ulna..	July 24, 1863.	Ulnar artery; 8 oz.	July 24, 1863.	Both ends in wound.	July 29, exc. Disch. Dec. 31, 1863.
21	Bell, G. L., Serg't, E, 10th Conn., age 34.	Dec. 15, 1862.	Flesh wound right forearm.	Dec. 27, 1862.	16 oz	Dec. 27, 1862.	In continuity; also amp. arm.	Died March 11, 1863.
22	Clapper, J. D., Pt., G, 43d N. Y., age 22.	July 12, 1864.	Left forearm	Aug. 8, 1864.	Ulnar artery; 6 oz. A. A. Surg. W. F. Atlee.	Aug. 8, 1864.	Both ends in wound.	Died Sept. 14, 1864.

Of the branches of the ulnar artery the interosseous was ligated in nine instances, of which three, or 33.3 per cent., proved fatal:

Ligations of the Interosseous Artery of Forearm.—Cases 1144-1152.—Private J. J. Boden, B, 45th Pennsylvania; shot fracture of lower extremity of radius September 14, 1862; October 17th, excision of pieces of radius; hæmorrhage; ligation of anterior interosseous in wound by Assistant Surgeon E. W. Brennermann, U. S. A.; discharged, April 18, 1863.—Private I. B. Flint, K, 1st Massachusetts Artillery, age 21; shot fracture right radius May 18, 1864; removal of ball and section of radius on May 28; hæmorrhages May 28, 30, June 1st; ligation of interosseous, June 1, in the wound; no recurrence; duty February 16, 1865.—Private T. Hart, C, 145th Pennsylvania, age 25; shot wound of third finger of left hand June, 1864; amputation of finger; gangrene; interosseous tied to prevent hæmorrhage; duty March 14, 1865.—Private *S. W. Howell*, E, 6th North Carolina, age 20; minié ball entered posterior part of left forearm two and a half inches from wrist joint, fractured the ulna and passed through, July 2, 1863; hæmorrhage July 13, 1863; ligation by A. A. Surgeon J. H. Bartholf; no recurrence of hæmorrhage; transferred August 10, 1863.—Private D. McKennelly, G, 10th Kentucky; shot fracture metacarpal bones of right hand September 19, 1863; September 28th, amputation, three fingers; October 29th, amputation forearm; November 4th, hæmorrhage from interosseous; ligated on face of stump; transferred to V. R. Corps August 20, 1864.—Corporal I. Martz, B, 184th Pennsylvania, age 39; shot fracture of middle finger of right hand June 3, 1864; amputation of finger June 3; gangrene; flap amputation of forearm at lower third; whole stump became diseased June 30, 1864; hæmorrhage from interosseous in July; ligation of artery on face of stump; circular amputation of arm at lower third April 9, 1865; discharged July 26, 1865.—Private J. Archibald, 33d New York, age 50; comminuted fracture of lower extremity of left radius and carpal bones December 13, 1862; amputation of forearm at upper third January 8, 1863; hæmorrhage from interosseous January 10th; artery ligated on face of stump same day; hæmorrhage recurred January 13, artery re-ligated; death from pyæmia January 29, 1863.—Private J. Bowman, K, 20th Indiana, age 25; shot fracture of forearm; hæmorrhages July 16th, August 4th; ligation; September 5th, amputation of arm; death of diphtheria and gangrene September 6, 1863.—Private J. A. Forsyth, G, 9th Maine, age 21; flesh wound of left wrist June 30, 1864; July 19th, hæmorrhage from branch of interosseous; July 20th, ligation of both ends in wound by Assistant Surgeon E. Curtis, U. S. A.; August 13th, hæmorrhage recurred; death ensued on August 13, 1864, from secondary hæmorrhage.

Ligations of Arteries of the Hand.—Of twelve cases, four were ligations of the palmar arch, two of the *dorsalis* and *radialis indicis*, one of the *dorsalis carpi*, one of the *arcus volaris profundi*, and four of the digital arteries. One only terminated in death, from pyæmic irritation of the system.

TABLE CXXXVI.

Condensed Summary of Twelve Cases of Ligations of Arteries of the Hand.

[Recoveries, 1—11; Death, 12.]

No.	NAME. AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF HÆMORRHAGE.	PROBABLE SOURCE OF HÆMORRHAGE.	DATE OF OPERATION.	OPERATION, OPERATOR.	RESULT.
1	Achuff, H. N., Pt., K, 27th Pa., age 20	May 3, 1863.	Fracture 3d finger right hand.	June 4, 1863.	Deep palmar arch.	June 4, 1863.	Branch deep palmar arch ligated.	Recovered.
2	*Gantt, Z.*, Pt., G, 27th S. C., age 36.	June 15, 1864.	Wound right hand..	July 20, 1864.	Digital artery.....	July 20, 1864.	One end 3d digital in wound. A. Surg. E. Curtis, U. S. A.	Recovered.
3	Gripping, I. G., Pt., Oneida N. Y. Cav., age 45.	July 3, 1863.	Fracture 2d met. bone right hand.	July 30, 1863.	Superficial palmar arch.	July 30, 1863.	Branch superfi. palmar arch in wound.	Discharged January 4, 1864.
4	Holdridge, H., Pt., A, 6th O. Cav., age 28.	May 12, 1864.	Wound both hands; fracture fingers.	May 21, 1864.	.....	May 21, 1864.	Both ends arch vol. prof. tied in wd. A. A. Surg. T. Liebold.	Discharged September 9, 1864.
5	Loland, J., Pt., 4th N. Y. Art., age 17.	June 16, 1864.	Fracture right metacarpus.	July 17, 1864.	Dorsalis indicis artery ligated.	July 19, 1864.	Dorsalis carpi, both ends in wound.	Discharged June 16, 1865.
6	McNamara, P., Pt., A, 2d N. Y. Art., age 36.	June 16, 1864.	Fracture metacarpus bone left little finger; amputation.	July 1, 1864.	Digital artery.....	July 1, 1864.	One end dig. art. tied in wound. Hæm. rec. July 6, 8, Aug. 5.	Aug. 11, amp. forearm. Disch. Mar. 27, 1865. *Spec.* 2450, A. M. M.
7	Mullin, D., Pt., K, 16th Mass., age 24.	May 8, 1864.	Fract. 1st 3 met. bones right hand; amp.	May 29, 1864.	.....	May 29, 1864.	Right dorsal indices on face stump.	Duty September 3, 1864.
8	Roberts, R. D., Pt., F, 72d Ill., age 49.	Mar. 9, 1864.	Flesh wound right forearm and hand.	Mar. 22, 1864.	Superficial palmar arch.	Mar. 27, 1864.	Right; superfi. palmar arch tied.	Discharged January 26, 1865.
9	Sylvester, H., Pt., G, 91st N. Y., age 23.	May 4, 1863.	Fract. 2d phal. right ind. finger; amp.	May 17, 1863.	.....	May 18, 1863.	Right radialis indicis on face stump.	Trans. Provo Marshal May 27, 1863.
10	Tucker, N. J., Pt., E, 17th Ky., age 23.	Sept. 2, 1864.	Fracture fingers left hand; amputation.	Sept. 25, 1864.	Superficial palmar arch.	Sept. 25, 1864.	Left; superfi. palmar arch, both ends in wound.	Duty December 7, 1864.
11	Turner, J. W., Pt., A, 126th Ohio, age 24.	May 12, 1864.	Flesh wound right hand.	May 21, 1864.	Digital artery.....	May 22, 1864.	Both ends dig. art. t'd in wound. Surg. N. R. Moseley, U. S. V.	Veteran Reserve Corps January 17, 1865.
12	Moynehan, W., Pt., F, 122d Ohio, age 40.	July 9, 1864.	Fracture bone left hand.	July 18, 1864.	Digital artery.....	July 18, 1864.	Digital artery tied in wound.	Amp. fing. Au. 1 hæ. Died Aug. 15, 1864.

Ligations of the Common Iliac Artery.—Four cases of ligations of the common iliac artery following shot injuries, and one following a bayonet stab, were reported during the war.[1]

TABLE CXXXVII.

Summary of Five unsuccessful Cases of Ligation of the Common Iliac Artery.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF HÆMORRHAGE.	PROBABLE SOURCE OF HÆMORRHAGE.	DATE OF OPERATION.	OPERATION, OPERATOR.	RESULT.
1	Boner, J., Pt., I, 48th Pennsylvania, age 19.	May 31, 1864.	Flesh wound of both thighs.	June 10, 15, 1864.	From small vessels; ligation of femoral June 15; hæmorrhage Jun. 22.	June 22, 1864.	Ligation of common iliac.	Death June 22, 1864. See p. 39, *ante*, CASE 82.
2	Hardy, John, Pt., H, 95th N. Y., age 25.	Aug. 20, 1864.	Shot wound of left gluteal region; ball lodged against right wall of pelvis.	Sept. 5, 1864.	Gluteal artery; hæmorrhages recurred Sept. 6, 8, 11; Sept. 12, ligation of internal iliac.	Sept. 12, 1864.	Ligation of common iliac by Asst. Surg. J. Cooper McKee, U. S. A.	Death Sept. 14, 1864. See *Sec. Surg. Vol.*, p. 334, CASE 976.
3	Preston, J. E., Corporal, G, 119th Penn.	May 4, 1864.	Shot injury of ant. sup. spin. process of left ilium.	May 5, 1864.	.....	May 14, 1864.	Dr. F. H. Hamilton.	Death M'y 14, '64. See p. 39, *ante*, NOTE 1.
4	Scott, J. R., Col., 19th Illinois.	Dec. 31, 1862.	Shot wound of groin, ball grazing inside of femur.	Apr. 9, 10, 1863.	Arrested by compress over femoral; hæmorrhage recurred; ligation of external iliac April 10; bleeding continued.	Apr. 10, 1863.	Ligation of common iliac by Dr. Brainard.	Death July 8, 1863. See CASE 975, *Sec. Surg. Vol.*, p. 333.
5	Tapka, A., Pt., H, 35th Wisconsin, age 25.	Mar. 18, 1864.	Bayonet stab in gluteal region.	Oct. 2, 1864.	Diffuse aneurism..	Oct. 7, 1864.	Ligation of common iliac by A. A. Surg. R. N. Isham.	Death Oct. 11, 1864. See CASE 977, p. 335 of the *Sec. Surg. Vol.*

In one of the five cases the external and in another the internal iliac artery had been ligated without arresting the bleeding.

Ligations of the Internal Iliac Artery.—Three cases were reported; all terminated fatally, from recurring hæmorrhage.

[1] A sixth case of ligation of the common iliac (case of Private G. W. Clark, I, 4th New Jersey) for aneurismal varix has been referred to in the preceding chapter, in the foot-note on page 681, and has been detailed on page 336 of the *Second Surgical Volume.*

TABLE CXXXVIII.

Condensed Summary of Three Ligations of the Internal Iliac Artery.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF HÆMORRHAGE.	PROBABLE SOURCE OF HÆMORRHAGE.	DATE OF OPERATION.	OPERATION, OPERATOR.	RESULT.
1	Fonda, E. R., Serg't-Major, 115th N. Y., age 28.	May 7, 1864.	Shot through right gluteal region.	June 12, 15, 17, 1864.	Sciatic artery	June 17, 1864.	Int. iliac above Poupart's lig't. Surg. A. B. Mott, U. S. V.	Died July 22, 1864. *Sec. Surg. Vol.*, p. 332, CASE 973.
2	Hardy, John, Pt., H, 95th N. Y., age 25.	Aug. 20, 1864.	Shot wound of left gluteal region; ball lodged against right wall of pelvis.	Sept. 5, 6, 8, 11, 12, 1864.	Gluteal artery ...	Sept. 12, 1864.	Lig. of internal iliac. Surg. J. Cooper McKee, U. S. A.	Sept. 12, ligation of com'n iliac. Death Sept. 14, 1864. *Sec. Surg. Vol.*, p. 334, CASE 976.
3	*P——, Thomas*, Pt., 16th Tenn. Cav.	July 10, 1864.	Shot penetration of left buttock.	July 26, 1864.	Gluteal artery	July 26, 1864.	Ligation of internal iliac. Dr. S. N. Denham.	Aug. 1, sudden hæmorrhage follow'd by death in a few minutes. *Sec. Surg. Vol.*, p. 332, CASE 972.

Eight cases of ligations of branches of the internal iliac comprised six ligations of the gluteal and two of the sciatic arteries; four of the former and one of the latter were fatal.

Ligations of the Gluteal Artery.—In four of the six cases the bleeding was the result of the shot injuries. In two instances the gluteal was accidently cut—in one while searching for the missile, in another while excising the head of the femur.

TABLE CXXXIX.

Summary of Six Ligations of the Gluteal Artery.

[Recoveries, 1—2; Deaths, 3—6.]

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF HÆMORRHAGE.	PROBABLE SOURCE OF HÆMORRHAGE.	DATE OF OPERATION.	OPERATION, OPERATOR.	RESULT.
1	Warner, A. J., Col., 10th Penn. Res.	Sept. 17, 1862.	Shot perforation of right ilium.	Feb 6, 1863.	Gluteal cut while searching for ball.	Feb. 6, 1863.	Lig. cardiac end in wound. Surg. J. H. Brinton, U. S. V.	Discharged and pensioned. *Sec. Surg. Vol.*, pp. 232, 329, CASE 678.
2	West, R., Pt., B, 104th Ill., age 31.	Aug. 7, 1864.	Flesh wound of right buttock.	Sept. 19, 1864.	Gluteal artery.....	Sept. 19, 1864.	Cardiac end ligated in wound.	Discharged Feb. 7, 1865. *Sec. Surg. Vol.*, p. 329, CASE 961.
3	Davidson, R. C., Pt., K, 6th Md., age 16.	April 2, 1865.	Shot wound of right hip, fract. of ilium.	Apr. 13, 15, 16, 1865.	Gluteal artery	Apr. 16, 1865.	In continuity. Surg. E. Bentley, U. S. Vols.	Death April 19, 1865. *Sec. Surg. Vol.*, p. 330, CASE 964.
4	*Johnson, G. M. W.*, Pt., I, 32d Tenn., age 20.	Feb. 15, 1862.	Shot wound of left hip.	Mar. 12, 1862.	Gluteal artery; 25 ounces.	Mar. 12, 1862.	Ligated	Death March 24, 1862. *Sec. Surg. Vol.*, p. 329. CASE 962.
5	Melcar, I., Pt., 8th Michigan, age 18.	Nov. 16, 1863.	Shot fracture of head and neck of femur.	Nov. 16, 1863.	Gluteal cut while excising head of femur	Nov. 16, 1863.	Cardiac end ligated. Surg. J. S. D. Cullen, P. A. C. S.	Died Dec. 2, 1863. *See* CASE 232, p. 97, *ante*.
6	Morrison, J., Serg't, A, 102d Ill., age 27.	May 15, 1864.	Shot wound of both buttocks.	June 17, 1864.	Gluteal artery; left.	June 17, 1864.	Ligation of gluteal. Ass't Surgeon B. E. Fryer, U. S. A.	Death from pyæmia July 3, '64. *Sec. Surg. Vol.* p. 329, CASE 963.

Ligations of Sciatic Artery.—The two cases of ligations of the sciatic artery proved fatal, one on the first the other on the third day after the operation.

CASES 1153–1154.—*W. R. Carrington*, H, 2d South Carolina, wounded at Cedar Creek October 19, 1864; comminution of transverse portion of sacrum; admitted on the next day into Prisoner's Hospital at Winchester; hæmorrhage from sciatic artery occurred on November 3d; artery ligated and missile extracted by Dr. Duval (Confederate); death November 4, 1864. — Private H. C. Leslie, M, 7th New York Artillery, aged 18 years, received a shot wound of nates, injuring the sciatic artery, by a minié ball, at Cold Harbor, June 3, 1864. The patient was removed to a field hospital of the Second Corps, and on June 8th was sent to Washington and admitted into Columbia Hospital; hæmorrhage to the extent of twenty-five ounces from the sciatic artery occurred on June 16th; ligation of the artery on the same day; death from gangrene June 19, 1864.

Ligations of the External Iliac Artery.—Of twenty-six cases of ligation of the external iliac artery twenty-three had fatal terminations, a mortality rate of 88.4 per cent. Six were ligations after amputations—one on the face of the stump, five in the continuity (four after amputations in the thigh and two after amputations at the hip); hæmorrhage recurred in six cases, and in one instance the common iliac was afterwards ligated.

TABLE CXL.

Summary of Twenty-six Ligations of the External Iliac Artery.

[Recoveries, 1—3; Deaths, 4—26.]

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
1	Locke, H., Pt., H, 6th Vermont, age 23.	May 5, 1864.	Flesh wound right thigh.	May 12, 1864.	Femoral art. ligated; hæm. rec.	May 16, 1864.	Right; in continuity.	V. R. C. December 3, 1864.
2	Smith, E. E., Pt., A, 11th Maine, age 19.	Aug. 16, 1864.	Fract. head rt. tib.; amp. thigh.	Oct. 17, 1864.	Femoral lig. Jan. 19, 1865; amp. at hip joint; hæm.	Jan. 27, 1865.	Ext. iliac tied. A. A. Surg. J. C. Morton.	Discharged May 27, 1865. *Spec.* 3709, A. M. M.
3	Zeiders, J. K., Serg't, I, 53d Penn., age 19.	July 3, 1863.	Flesh wd. rt. thigh; Aug. 4, fem. art. lig.; Aug. 11, religated.	Oct. 8, 1863.	.....	Oct. 8, 1863.	Right; in continuity.	Discharged May 14, 1864.
4	[1]*Brown, B. B.*, Pt., C, 9th Va. Cav., age 24.	June 24, 1864.	Fract. ramus pubis..	July 14, 1864.	Femoral aneurism	July 18, 1864.	Left; in cont. Ass't Surg. J. C. Baylor, C. S. A.	Died Aug. 22, 1864; exhaustion.
5	[2]Cornwell, R. B., Pt., 25th Ohio, age 23.	Sept. 14, 1862.	Wound right thigh, inj. femoral art.	Sept. 21, 1862.	Aneurism; femoral artery ligated.	Oct. 30, 1862.	Right; in continuity.	Died Nov. 3, 1862.
6	Degolia, J. S., Pt., A, 76th Penn., age 32.	May 16, 1864.	Flesh wounds right hip and left thigh	May 24, 1864.	Femoral artery tied.	May 29, 1864.	Left; in cont. Surg. J. H. Thompson, U. S. V.	Died June 1, 1864; gangrene.
7	Dougherty, M., Pt., E, 49th Pa., age 35.	Sept. 19, 1864.	Fracture left knee; amputation thigh.	Nov. 4, 1864.	Femoral artery ligated 3 times.	Mar. 26, 1865.	Left; in continuity; hæm. recurred.	Died April 8, 1865.
8	[3]*Gatewood, J. H.*, Pt., F, 21st Ga., age 32.	Aug. 28, 1862.	Flesh wounds left hip and right thigh.	.....	Femoral aneurism.	Jan. 31, 1864.	Right; in continuity. Surg. J. Chambliss, P. A. C. S.	Died Feb. 17, 1864.
9	Gentle, G. W., Pt., E, 5th Ohio.	Sept. 17, 1862.	Fracture right femur.	Oct 2, 3, 1862.	.....	Oct. 27, 1862.	Right ext. iliac tied..	Died Oct. 28, '62. *Sp's* 758, 894, A. M. M.
10	Hambrecht, C., Pt., E, 4th New Jersey.	Sept. 14, 1862.	Fract. os pubis and neck femur.	Oct. 18, 1862.	.....	Oct. 18, 1862.	Ext. iliac and fem. arts. tied.	Died Oct. 18, 1862.
11	Heary, P., Pt., E, 73d Ohio, age 25.	Mar. 11, 1862.	Wound in iliac region.	Mar. 27, 1862.	.....	Mar. 27, 1862.	Ext. iliac tied in continuity.	Died April 26, 1862; pyæmia.
12	Husk, G. W., Pt., F, 1st Maryland Cavalry, age 49.	Aug. 16, 1864.	Flesh wound right thigh.	Nov. 10, 1864.	Femoral artery....	Nov. 10, 1864.	Right; in cont. A. A. Surg. J. C. Morton.	Died Nov. 17, 1864; hæmorrhage.
13	[4]*Langford, J. R.*, Pt., F, 10th Ga., age 19.	Sept. 17, 1862.	Wound in rt. groin, injuring fem. art.	Nov. 6, 1862.	Femoral aneurism.	Nov. 6, 1862.	Right; in continuity.	Died Mar. 15, 1863. *Spec.* 3986.
14	McQuillan, J. A., Lt., I, 38th Ohio, age 25.	Aug. 17, 1864.	Flesh wound right thigh.	Sept. 20, 1864.	Femoral art. tied September 20.	Sept. 26, 1864.	Right; in continuity.	Died Oct. 2, 1864.
15	Marshall, W. L., Pt., E, 11th Pa., age 26.	June 27, 1862	Flesh, right thigh, inj. fem. art.	Aug. 23, 1862.	False aneurism; femoral tied.	Sept. 5, 1862.	Right; in continuity.	Died Sept. 16, 1862.
16	O'Neil, M., Pt., E, 58th Mass., age 19.	June 3, 1864.	Fract. right femur; amp. at hip joint.	Aug. 20, 1864.	Femoral artery....	Aug. 20, 1864.	Right; in continuity.	Died Sept. 2, 1864. *Spec.* 3098.
17	Ridge, J., Lieut., B, 13th Iowa.	July 21, 1864.	Wound in left iliac region.	Aug. 26, 29, '64.	Epigastric artery..	Aug. 30, 1864.	Left; in continuity..	Died Oct. 4, 1864; pyæmia.
18	[5]Scott, J. R., Col., 19th Illinois.	Dec. 31, 1862.	Wound in thigh, inj. fem. artery.	April 5, 9, 1863.	Profunda artery...	April 10, 1863.	Ext. iliac tied. Dr. D. Brainard.	Common iliac tied. Died July 8, 1863; diarrhœa.
19	Seaburn, A., Pt., G, 97th Pennsylvania.	July 30, 1864.	Fract. left femur; amp. thigh.	Sept. 22, 1864.	Aneurism.....	Sept. 25, 1864.	Left; in cont. Surg. E. Bentley, U. S. V.	Died Oct. 9, 1864. *Spec.* 3282.
20	Sears, L. C., Sergt. maj., 5th N. H., age 22.	Dec. 13, 1862.	Flesh wound right thigh; profunda inj.	Dec. 22, 1862.	— femoral artery tied.	Jan. 8, 1863.	Right; in cont. Surg. T. Antisell, U. S. V.	Died Jan 11, 1863.
21	Shields, P. J., Pt., D, 6th Wis., age 20.	Apr. 29, 1863.	Fract. left knee jt.; amp. thigh.	June 1, 1863.	Stump; fem. art. tied and relig.	June 9, 1864.	Left; in continuity..	Died June 19, 1864. *Spec.* 1143.
22	Smith, H. F., Corp., 1st Wis., age 25.	Mar. 24, 1862.	Fracture left femur..	Mar. 30, 1862.	Femoral artery....	Mar. 30, 1862.	Left; in cont. Surg. A. H. Thurston, U. S. V.	Died Mar. 30, 1862.
23	[6]Spaulding, J. R., Pt., F, 112th New York, age 23.	Jan. 15, 1865.	Flesh wound left thigh.	Mar. 23, 31, 1865.	.....	April 2, 1865.	Left; in cont. Ass't Surg. S. H. Orton, U. S. A.	Died June 15, 1865.
24	Teel, M., Pt., C, 73d Indiana.	Dec. 31, 1862.	Fract. right thigh...	.....	.....	Jan —, 1863.	Right; in continuity.	Died Jan. 19, 1863.
25	Vogel, F., Pt., G, 74th Penn., age 28.	July 3, 1863.	Fract. rt. fib.; hæm.; amp. leg.	Sept. 8, 1863.	Stump; fem. art. tied Sept. 8.	Sept. 19, 1863.	Right; in cont. A. A. Surg. A. Hewson.	Died Oct. 4, 1863; hæmorrhage.
26	Yockey, P., Pt., D, 29th Ohio, age 29.	July 22, 1864.	Fract. right femur; amp. thigh; reamp.	.....	.....	.....	Right; in cont.; fem. art. prev. tied.	Died April 23, 1865; diarrhœa.

Ligation of the Spermatic Artery.—The only instance of ligation of this artery has been detailed on page 337 of the *Second Surgical Volume:*

CASE 1155.—Color-Sergeant E. W. Crippen, C, 27th Illinois, aged 29, was wounded at Missionary Ridge November 25, 1863; the left testicle was shot away, leaving a ragged wound of the scrotum, also wound of ankle. On November 28 the spermatic artery was ligated and the debris of the testicle removed. Hæmorrhage, which ceased spontaneously, occurred on December 14; on December 19 hæmorrhage from wound of ankle, arrested by persulphate of iron; death on the same day.

Ligations of the Femoral Artery.—Three hundred and seventy-four cases, including ninety-three recoveries and two hundred and eighty-one deaths, are comprised in this group, giving a mortality rate of 75.1 per cent. In one hundred and seventy-nine cases amputation

in the thigh had been performed prior to the ligation; in eighty-two of these cases the vessel was ligated on the face, and in ninety-seven in the continuity of the stump. In nineteen cases, with five recoveries and fourteen deaths, the ligations were followed by amputation.

TABLE CXLI.

Summary of Three hundred and Seventy-four Ligations of the Femoral Artery.

[Recoveries, 1—93; Deaths, 94—374.]

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF HÆMORRHAGE.	PROBABLE SOURCE OF HÆMORRHAGE.	DATE OF OPERATION.	OPERATION, OPERATOR.	RESULT.
1	Askey, J., Pt., F, 200th Penn., age 18.	Mar 25, 1865.	Fract. r't knee joint; March 28, amputation thigh.	Apr. 11, 1865.	Femoral artery....	Apr. 11, 1865.	Right; in continuity. Act. Assist. Surg. J. Tyson.	Disch'd July 28, 1865. *Specimen* 3997, A. M. M.
2	Atchison, J. N., Pt., F, 2d N. J., age. 28.	Aug. 27, 1862.	Fract. left femur; primary amputation thigh.	Sept. 3, 1862.	Femoral artery....	.....	Right; in continuity. Surg. E. Bentley, U. S. V.	Discharged June 3, 1863.
3	Austin, A. H., Pt., B, 106th N. Y.	Apr. 20, 1863.	Fract. left leg; amp. thigh May 22.	June 7, 1863.	Femoral artery ...	June 7, 1863.	Left; in continuity; hæm. rec. June 11.	Discharged August 23, 1863.
4	Barkaloo, J. T., Pt., M, 2d Ohio Cav., age 28.	July 19, 1863.	Flesh wound right thigh.	July 19, 1863.	Popliteal artery ..	July 19. 1863.	Right; in continuity.	Amp. thigh. Disch'd March 17, 1865.
5	Blake, G., Pt., I, 3d W. Va. Mtd. Inf.	Aug. 27, 1863.	Flesh wound left thigh, severing popliteal artery.	Sept. 9, 1863.	....	Sept. 9, 1863.	Left; in continuity. Surg. W. D. Stewart, U. S. V.	Discharged November 12, 1863.
6	Brannan, J., Pt., C, 44th N. Y., age 26.	July 2, 1863.	Fracture right leg; prim. amp. leg.	July 12, 1863.	Post. tib. art.; art. tied.	July 15, 1863.	Right; in continuity; in Scarpa's space.	Recovered.
7	Brown, J., Pt., D, 120th Ohio.	May 28, 1863.	Flesh, left leg	June 9, 10, '63.	.....	June 10, 1863.	Left; in cont. Sur. J. D. Brumley, U. S. V.	Furloughed July 31, 1863.
8	*Brown*, W., Serg't, 1st Md. Art.	Dec. 10, 1863.	Flesh wound left thigh.	.....	....	.....	Femoral artery tied.	Detailed Mar. 16, 1864.
9	Bugbee, S., Corp., E, 14th Conn., age 24.	Oct. 27, 1864.	Wound right knee joint; prim. amp. thigh, lower third.	Nov. 8, 1864.	Stump	Nov. 12, 1864.	Right; on face stump. Surg. W. L. Baylor, C. S. A.	Discharged August 23, 1865.
10	*Cheany*, W. W., Lt., B, 30th Ark.	July 4, 1863.	Wound right knee; prim. amp. thigh.	Aug. 17, 1863.	Femoral artery....	Aug. 17, 1863.	Right; in continuity.	Transferred to prison April 21, 1864.
11	[1]*Cheek*, *M.*, Pt., I, 61st N. C.	July 30, 1864.	Flesh wound thigh.	Aug. 3, 1864.	Femoral artery....	Aug. 3, 1864.	Femoral tied, in continuity. Sur. D. F. Wright, P. A. C. S.	Furloughed August —, 1864.
12	Cleggett, T., Pt., D, 76th Colored troops, age 45	Apr. ?, 1865.	Fracture right knee joint; amp. thigh, lower 3d, April 24.	May 2, 1865.	Femoral artery....	May 2, 1865.	Ligation in continuity, in upper third.	Discharged July 22, 1865.
13	Clover, B., civilian, age 16.	Aug.—, 1864.	Flesh wound thigh, femoral injured.	Sept. 1, 1864.	Aneurism of femoral.	Sept. 1, 1864.	Ligation in cont. just above profunda.	Recovered.
14	*Coble*, *J. A.*, Pt., F, 45th N. C., age 20.	Nov. 27, 1863.	Flesh wound of left thigh, lesion of femoral.	Jan. 23, 1864.	Aneurism of femoral.	Jan. 23, 1864.	Both ends in wound. Surg. J. G. Dudley, C. S. A.	Recovery.
15	Cockburn, W., Serg't, H, 2d New Jersey Cav., age 38.	Dec. 28, 1864.	Shot fracture left knee joint; amp. Dec. 29.	Jan. 7, 1865.	Femoral artery....	Jan. 7, 18, 23, 1865.	Three consecutive ligations in continuity.	Mustered out May 11, 1865.
16	Collins, M., Pt., K, 13th Kansas, age 27.	Dec. 7, 1862.	Left knee joint; amp. thigh Dec. 10	Dec 25, 1862.	Femoral artery....	Dec. 25, 1862.	In cont., in middle..	Discharged May 13, 1864.

241	Lapp, C., Pt., I, 22d Wisconsin, age 21.	July 20, 1864.	Left thigh, femoral artery cut.	Aug. 11, 1864.	Femoral	Aug. 11, 1864.	Femoral. A. A. Surg. J. M. Browne.	Died August 11, 1864.
242	Larabee, J., Pt., E, 75th Ohio, age 19.	July 1, 1863.	Left leg; amputation of leg.	July 18, 20, '63.	Posterior tibial artery.	July 21, 1863.	Femoral, in continuity.	Died August 20, 1863.
243	Lawson, L. B., Pt., F, 128th New York.	Sept. 19, 1864.	Left knee j'nt; Sept. 26, amp. thigh.	Oct. 1, 1864.	From stump	Oct. 1, 1864.	On face of stump	Died October 4, 1864.
244	*Layne, J. H.*, Pt., B, 19th Virginia, age 18.	April 6, 1865.	Flesh, lower third right thigh.		Femoral vein	April 25, 1865.	Artery and vein. A. A. Surg. J. Morris.	May 6, lig. above profun. Died May 7, 1865; exhaustion.
245	Lazier, W., Pt., M, 5th Cav., age 25.	Aug. 1, 1863.	Fracture right ankle	Aug. 17, 18, '63.	Tibial	Aug. 18, 1863.	In cont. A. Surg. W Thomson, U. S. A.	Died Aug. 19, 1863; pyæmia.
246	Leake, W. G., Pt., K. 6th New Jersey.	May 5, 1862.	Leg and thigh				In continuity	Died May 20, 1862.
247	Leline, G., Serg't, C, 8th Mich., age 27.	Nov. 30, 1864.	Flesh, right thigh, femoral artery.			Dec. 5, 1864.	In cont. A. A. Surg. S. T. Williams.	Died Dec. 5, 1864; hæmorrhage.
248	Linn, H., Pt., A, 6th Pennsylvania Reserves, age 25.	Sept. 17, 1862.	Left fibula; Dec. 3, exc.; 4th, amp.; Jan. 15, amp. thigh.			Feb. 4, 1863.	Ligation	Died March 31, 1863. *Specs.* 748, 3818, 3983.
249	Loetsch, H., Pt., G, 9th N. J., age 56.	Dec. 14, 1862.	Fracture right knee; 14th, amp. thigh.	Jan. 14, 17, '63.		Jan. 17, 1863.	In cont. Surg. C. A. Cowgill, U. S. V.	Died Jan. 31, 1863; rec. hæmorrhage.
250	Loutz, J., Pt., D, 94th New York, age 17.	April 2, 1865.	Fracture lower third left femur; amp.			May 19, 1865.	On stump; May 25, relig. in cont. A. A. Surg. H. M. Bellows.	Died May 26, 1865.
251	Lund, E. F., Pt., C, 4th New Hampshire, age 20.	July 30, 1864.	Flesh, left thigh, right knee joint.	Aug. 12, 1864.		Aug. 12, 1864.	Both ends in wound. A. Surg. W. Thomson, U. S. A.	Died Aug. 23, 1864; pyæmia. *Spec.* 3592, A. M. M.
252	Lutz, J., Pt., B, 1st Pa. R., age 17.	Dec. 13, 1862.	Fracture left femur; 20th, amp. thigh.	Dec. 22, 1862.	Femoral	Dec. 22, 1862.	On face of stump	Died December 22, 1862.
253	Lynn, J. B., 83d Ohio, age 19.	April 9, 1865.	Fracture right tibia, knee; May 30, amp.	June 5, 1865.	Femoral	June 5, 1865.	In continuity	Died June 7, 1865; exhaustion.
254	McCarthy, J., Corp'l, E, 76th N. Y., age 31.	Oct. 1, 1864.	Neck of right femur	Nov. 5, 1864.	Profunda	Nov. 5, 1864.	In continuity, below Poupart's lig.	Hæm. recurred. Died Nov. 13, 1864.
255	*McDaniel M.*, Pt., K, 48th Virginia.	May 23, 1863.	Fractured leg; June 9, amputation leg.			June 27, 1863.	In continuity	Died July 8, 1863.
256	McGuire, T., Pt., D, 53d Penn, age 19.	Dec. 13, 1862.	Fractured left leg, upper third.	Dec. 31, 1862.	Post. tibial	Dec. 31, 1862.	In continuity; two ligatures; excision.	Died Jan 3, '63; gangrene.
257	McMahon, J., Pt, A, 61st New York.	Sept. 17, 1862.	Fractured left knee joint; Sept., amputation thigh.			Oct. 3, 1862.	Ligation	Died Oct. 16, 1862.
258	McReynolds, J., Corporal, 9th Co., 60th Ohio, age 20.	Aug. 19, 1864.	Both thighs			Sept. 5, 1864.	In continuity. A. A. Surg. H. B. Mabon; Sept. 11, relig.	Hæm. recurred. Died Sept. 17, 1864; hæm.
259	*Madden, C. B.*, Pt., 3d S. C. Bat., age 17.	Sept. 14, 1862.	Fract'd right knee; Oct. 2, amputation.	Oct. 15, 1862.	Femoral	Oct. 15, 1862.	In continuity	Died Oct. 28, 1862; exhaustion.
260	*Martin*, ——, C, 16th Ga.	Sept. 14, 1862.	Upper part of thigh.			Sept. 28, 1862.	In wound, both ends	Died Sept. 28, 1862.
261	*Mask, M.*, Pt., A, 23d N. C., age 24.	Sept. 14, 1862.	Right thigh; Sept. 20, amputation.	Oct. 6, 1862.		Oct. 6, 1862.	On face of stump	Hæm recur'd. Died Oct. 9, '62; exha'st'n.
262	Mason, J. W., Pt., I, 12th N. Y., age 21.	Aug. 30, 1862.	Shot wound				Ligation of femoral	Died Sept. 28, 1862.
263	Maxfield, D., Pt., E, 97th N. Y., age 20.	Sept. 17, 1864.	Head left tibia; Oct. 22, amputat'n thigh.	Oct. 25, 1864.	Femoral	Oct. 25, 1864.	In continuity	Died Oct. 27, 1864.
264	Mellott, F. L., Pt., K, 12th Penn.	Sept. 14, 1862.	Fractured left knee joint.			Sept. 16, 1862.	In continuity, to prevent inflammation.	Died Oct. 28, 1862.
265	Meranville, R. E., Corporal, F, 2d N. Y. C.	Aug. 29, 1862.	Thigh; primary amputation.	Sept. 5, 6, 1862.		Sept. 7, 1862.	In continuity, above profunda.	Hæm. recurred. Died Sept. 12, 1862.
266	Merriott, E., Pt., D, 6th Mo C. S. M., age 23.	May 3, 1865.	Left knee joint; 4th, amputation.	May 4, 1865.	Femoral	May 4, 1865.	On face stump; two muscular branches also tied.	Died May 29, '65; exhaustion.
267	Metzer, W., Serg't, E, 1st La., age 26.	Apr. 23, 1864.	Left thigh; Apr. 29, amputation.		Femoral	May 15, 1864.	In continuity, Scarpa's space.	Died May 15, 1864; exhaustion.
268	Miller, A., Pt., E, 95th Penn., age 18.	May 3, 1863.	Fract'd cond. right femur; 14th, amputation.	May 25, 1863.		May 28, 1863.	In continuity	Died June 6, 1863; pyæmia.
269	Miller, G. H., Pt., F, 3d Iowa, age 23.	May 18, 1863.	Right thigh, profunda artery.	June 3, 1863.	Profunda	June 3, 1863.	In continuity, above profunda.	Hæm. recurred. Died June 10, 1863.
270	Mills, J., Pt., D, 4th Missouri Cav.	Jan. 16, 1864.	Left femoral artery.	Feb. 7, 1864.			Ligation	Died Feb. 17, 1864.
271	Moan, F. H., Corp'l, F, 6th Me., age 22.	May 3, 1863.	Right knee joint; 14, amputation thigh.	May 16, 18, 1863.	Stump	May 18, 1863.	In continuity	Died May 23, 1863.
272	Mohre, A., Pt., K, 104th Penn.	June 1, 1862.	Fract'd left femur; June 9, amp. thigh.	June 15, 1862.		June 15, 1862.	Ligation	Died June 19, 1862.
273	Monaghan, M., Pt., C, 2d Mich., age 43.	June 17, 1864.	Fractured left leg; 17, amputation leg.	July 20, 1864.	Tibial	July 20, 1864.	In continuity. A. A. Surg. W. H. Ensign.	Died July 25, 1864; gangrene.
274	*Morris, W. C.*, Pt., E, 4th Alabama, age 24.	May 19, 1864.	Fracture right leg; primary amputation thigh.	June 12, 1864.	Femoral	June 29, 1864.	On face of stump	Died July 2, 1864.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
275	Moscrip, W. S., Serg't, 19th Wisconsin, age 33.	Aug. 22, 1864.	Flesh, middle third left thigh.	Aug. 27, 1864.	Femoral	Aug. 27, 1864.	In continuity, Scarpa's triangle.	Sept. 8, hæm. Died Sept. 14, 1864; exhaustion.
276	Mullin, F. H., Pt., F, 3d Penn., age 17.	Nov 14, 1863.	Muscles of r't thigh, severing femoral.			Nov. 14, 1863.	Ligation	Died Nov. 14, 1863; nervous depression.
277	Murphy, D., Pt., F, 62d Penn., age 18.	Dec. 13, 1862.	Right knee-joint; int. amp. thigh.	Jan. 4, 1863.	Femoral	Jan. 4, 1863.	On face of stump	Died January 4, 1863; exhaustion.
278	*Myers, G. R.*, Pt., E, 6th Va. Cavalry.	1864.	Left knee joint; amp. thigh.		Femoral	Oct. 8, 1864.	Ligation	Oct. 9, hæm. Died October 10, 1864.
279	O'Keefe, J., Maj., 2d N. Y. C., age 24.	Apr. 1, 1865.	Flesh, right popliteal space.	Apr. 1, 1865.	Femoral	Apr. 1, 1865.	Within adductor mag.; relig. in cont.	Died May 31, 1865.
280	Osgood, T. J., Pt., A, 39th Ill., age 20.	Aug. 16, 1864.	Fracture head right tibia; Sept. 15, amputation thigh.	Sept. 23, 1864.	Femoral	Sept. 23, 1864.	Ligated by A. A. Surg. J. C. Morton.	Died September 28, 1864; exhaustion.
281	*Pack, J. R.*, Pt., D, 39th N. C., age 17.	Apr. 8, 1865.	Flesh, right thigh, lower third, injuring artery.	Apr. 20, 27, 1865.		Apr. 27, 1865.	In cont., in Scarpa's space. A. A. Surg. H. B. Cole.	Died April 27, 1865; congestive chill.
282	Paddock, D. G., Pt., G, 83d Penn., age 23.	May 8, 1864.	Fracture right knee j't; 16th, amp.; lig. muscular branches.	May 23, 1864.	Femoral	May 24, 1864.	In continuity, below Poupart's ligament.	Died May 24, 1864; exhaustion.
283	Paden, W., Corp'l, G, 10th Penn. Reserves, age 22.	May 23, 1864.	Popliteal space, right thigh.	May 29, 31, 1864.	Popliteal	May 31, 1864.	In continuity. Surg. G. L. Pancoast, U. S. V.	Gangrene; amputation leg. Died June 26, 1864.
284	Parker, J., Corp'l, H, 58th Mass., age 38.	June 3, 1864.	Fracture middle third left femur.	June—, 1864.		June 27, 1864.	Ligation	Died July 12, 1864.
285	[1] *Parker, N.*, Corp'l, B, 51st (?)	May 16, 1864.	Fracture left tibia; May 29, lig. post. tibial.	June 1, 1864.	Sloughing	June 1, 1864.	In continuity where it passes under sartorious.	Hæm.; amputation. Died June 2, 1864.
286	Parks, J., Pt., E, 91st Penn., age 38.	June 18, 1864.	Fracture, and amp. up. third left leg.	June 30, 1864.	Stump	June 30, 1864.	In continuity; religated July 6.	Died July 12, 1864.
287	Parry, T., Serg't, D, 16th Mich., age 30.	Sept. 30, 1864.	Flesh, right thigh	Nov. 19, 1864.	Femoral	Nov. 19, 1864.	Both ends in wound. A. A. Surg. G. R. B. Robinson.	Died November 21, 1864; exhaustion.
288	Payne, D., Pt., H, 2d Conn. H. A., age 25.	Oct. 19, 1864.	Left knee jt.; Nov. 2, amputation thigh.	Nov. 13, 1864.	Femoral	Nov. 13, 1864.	On face of stump	Died Nov. 17, 1864.
289	Payne, G. H., Pt., K, 64th New York, age 18.	Oct. 12, 1864.	Fracture left fibula; 21st, lig. popliteal.	Oct. 28, 1864.	Femoral	Oct. 29, 1864.	In continuity, low down.	October 29, amputation. Died Dec. 4, 1864; exhaustion.
290	Pencil, E., Pt., H, 93d Pennsylvania.	May 31, 1862.	Femoral artery			June 16, 1862.	In continuity, four inches below Poupart's ligament.	Died July 5, 1862; pyæmia.
291	Peters, W. C., Pt., C, 68th Penn.	July 2, 1863.	Flesh, left thigh, lower third.	July 15, 1863.	Femoral	July 15, 1863.	Ligation	Died July 15, 1863.
292	Pope, P. P., Pt., M, 67th Ohio, age 22.	May 9, 1864.	Flesh, right thigh	May 21, 1864.	Femoral	May 21, 1864.	In continuity	Died May 22, 1864; exhaustion.
293	Pope, W., Pt., I, 2d N. Y. A., age 19.	June 3, 1864.	Flesh, lower third left thigh.	June 20, 1864.	Femoral	June 20, 1864.	One end in wound	Died June 24, 1864.
294	Pulhemus, J., Pt., E, 1st Mich., age 20.	Dec. 13, 1862.	Fract. tib. ant. tibial artery; 26th, hæm.; amp. thigh.	Dec. 30, 1862.		Dec. 30, 1862.	On face of stump	Died Jan. 15, 1863; nervous prostration.
295	Rairdon, W., Pt., I, 40th Ind., age 35.	June 27, 1864.	Fracture right foot; July 9, amp. thigh.	July 23, 1864.		July 23, 1864.	In continuity	Died July 23, 1864; exhaustion.
296	Rapp, D., Pt., K, 7th Indiana, age 20.	Nov. 30, 1863.	Flesh, left thigh, fem. art. and vein.	Dec. 9, 1863.	Femoral	Dec. 9, 1863.	Both ends in wound. A. Surg. W. Thomson, U. S. A.	Femoral vein also ligated. Died Dec. 13, 1863; gangrene.
297	*Rayner, G. W.*, Pt., G, 12th Alabama.	Apr. 6, 1865.	Fracture left femur; April 17th, amp.	Apr. 27, 1865.	Femoral	Apr. 27, 1865.	On face of stump	Died May 6, 1865; exhaustion.
298	Reed, J., Pt., C, 15th W. Va., age 26.	June 18, 1864.	Left knee j'nt; 20th, amp. thigh.	Nov. 1, 1864.	Femoral	Nov. 1, 1864.	On face of stump; Nov. 8, hæm.; amp.	Died Nov. 14, 1864; exhaustion.
299	*Reed, J. P.*, Pt., B, 19th Ala., age 20.	Apr. 6, 1862.	Right thigh	May 29, 1862.		May 29, 1862.	Ligation	Died June 30, 1862.
300	Reed, W. H., Pt., H, 10th Vt., age 31.	Oct. 19, 1864.	Right knee j'nt; 21st, amp. thigh.	Oct. 24, 1864.		Oct. 24, 1864.	Ligation; hæm. recur. Oct. 29.	Died Nov. 21, 1864; pyæmia.
301	Reigle, J., Pt., A, 88th Penn., age 23.	May 8, 1864.	Right knee; 28th, amp. thigh.	June 8, 12, 1864.		June 12, 1864.	In cont.; hæm. June 16, 24.	24th, religated. Died June 24, 1864.
302	Riley, E., Pt., G, 98th Illinois.	June 25, 1863.	Flesh, both thighs.	July 6, 8, 1863.		July 8, 1863.	In continuity, one end.	Died July 11, 1864.
303	Ringer, O., Pt., C, 60th Ohio, age 21.	July 6, 1864.	Right thigh; flesh.	Aug. 22, 1864.		Aug. 22, 1864.	In cont., one end. A. A. Surg. J. F. Holt.	23d, hæm. Died Aug. 25, 1864.
304	Roberts, J., Serg't, 9th W. Va., age 31.	July 20, 1864.	Upper third femur	July 29, 1864.	Femoral	July 29, 1864.	Ligation. Surg. J. B. Lewis, U. S. V.	Aug. 4, hæm. Died August 24, 1864.
305	Roberts, A., Pt., I, 127th Ill., age 20.	May 19, 1863.	Flesh, left popliteal space.	June 3, 1863.	Popliteal	June 5, 1863.	In continuity, upper third.	Died June 7, 1863.
306	Robinson, J., Pt., D, 12th Conn., age 34.	Oct. 19, 1864.	Right knee joint; Nov. 4, amp.	Nov. 11, 1864.	Femoral	Nov. 11, 1864.	On face of stump	Died Nov. 23, 1864.
307	Robinson, S., Serg't, 3d N. H., age 23.	May 12, 1864.	Left hip and root of penis.	May 28, 29, 1864.	Profunda, or pudic	May 29, 1864.	In cont. ¾ inch below Poupart's lig.	June 1, hæm. Died June 2, 1864; hæm.
308	Rodgers, S. J., Pt., A, 2d Mich., age 21.	June 17, 1864.	Mid. right thigh		Aneurism	July 26, 1864.	In cont., both ends. A. A. Surg. O. W. Peck.	Died July 30, 1864; hæm.
309	Roe, J., Pt., B, 42d New York.	Sept. 17, 1862.	Fract. low. left fem.; October 27, amp.	Oct. 29, 30, 1862.	Femoral	Oct. 30, 1862.	Ligation	Died Oct. 30, 1862; exhaustion.
310	Root, J. L., Pt., H, 77th New York.	Oct. 19, 1864.	Fracture left femur			Oct. 19, 1864.	Ligation	Died Nov. 1, 1864.
311	Rope, S., Pt., A, 140th Penn., age 43.	June 16, 1864.	Frac. left leg; 17th, amp. thigh.	July 26, 1864.		July 26, 1864.	In cont., in Scarpa's space. Surg. R. B. Bontecou, U. S. V.	Died Aug. 10, 1864; exhaustion.
312	Rosenfelt, N., Serg't, D, 26th Pa., age 22.	July 2, 1863.	Head of fibula; 19th, amp.	Aug. 13, 14, 1863.	Femoral	Aug. 14, 1863.	On face of stump	Died Oct. 2, 1863.
313	Ruhling, F. J., S'g't, E, 112th New York, age 29.	June 1, 1864.	Left tibia knee joint; 11th, amp. thigh.	June 11, 14, 1864.	Mus. branch and femoral.	June 14, 1864.	On face of stump; June 17, religation in continuity.	Died July 8, 1864; gangrene.
314	Sager, W., Serg't, E., 188th N. Y., age 19.	Apr. 1, 1865.	Flesh, middle, right thigh.	Apr. 15, 20, 21, 22, 1865.	Femoral	Apr. 22, 1865.	Both ends, in cont. A. Surg. W. F. Norris, U. S. A.	Died April 29, 1865; pyæmia.

363	Williams, L., Pt., C, 26th Mich., age 23.	May 12, 1864.	Left knee; June 13, amp. thigh, middle.	July 18, 1864.	Femoral; recurred	July 19, 1864.	On face of stump....	Died July 19, 1864.
364	Willis, A., Pt., I, 7th R. I., age 25.	Dec. 13, 1862.	Femoral artery.....	Dec. 22, 25, 1862.	Femoral.....	Dec. 25, 1862.	Ligation	Died Dec. 28, 1862.
365	Wilson, C. M., Pt., F, 4th N. Y., age 35.	May 5, 1864.	Lower 3d left femur; June 2, amputation.	June 5, 1864.	.....	June 5, 1864.	In continuity above profunda.	Died June 5, 1864; exhaustion.
366	Wilson, G. S., Adj. 17th N. Y., age 24.	Dec. 13, 1862.	Right knee joint; Jan. 3, amputation.	Jan. 12, 1863.	Femoral	Jan. 12, 17, 1863.	On face of stump....	Died Feb. 17, 1863; pyæmia.
367	*Wilson, J*, Pt., B, 5th Texas, age 32.	July 2, 1863.	Fracture right fem.; July 4, amp. thigh.	July 15, 1863.	Femoral.....	July 15, 1863.	In continuity, Scarpa's space.	Hæm. recur'd. Died July 23, 1863.
368	Wipfelder, F., Pt., C, 52d N. Y.	June 1, 1862.	Fracture right fem.; 2d, amp. middle.	June 9, 1862.	From stump	June 9, 1862.	Ligation	Died June 17, 1862.
369	Witham, A., Pt., A, 1st Maine Heavy Artillery, age 20.	May 19, 1864.	Flesh, left thigh, upper third.	June 29, 1864.	Profunda	June 29, 1864.	In cont. just below Poupart's lig. A. A. Surg. J. Newcombe.	Died July 2, 1864.
370	Woolsey, A., Pt., H, 20th N. Y. S. M.	Aug. 30, 1862.	Left knee; Oct. 1, amputation thigh.	Oct. 2, 1862.	Profunda.....	Oct. 2, 1862.	In continuity, Scarpa's triangle.	Died Oct. 5, 1862; exhaustion.
371	Worley, S., Pt., A, 139th Penn., age 20.	May 5, 1864.	Right thigh	.....	.....	May 20, 1864.	Ligation	Died June 2, 1864.
372	Wynne, W. G., Pt., F, 66th New York.	Sept. 17, 1862.	Fracture left knee; Oct. 16, amp. thigh.	.....	From stump	Oct. 25, 1862.	In continuity, Scarpa's triangle.	Died Nov. 3, 1862. *Spec.* 746, A. M. M.
373	Yockey, P., Pt., D, 29th Ohio, age 29.	July 22, 1864.	Fract. right femur; prim. amp. thigh; reamp. middle.	... .	From stump	.....	Ligation of femoral; subsequent lig. of external iliac.	Died April 23, 1865.
374	Young, A., Pt., F, 1st Missouri Cavalry.	Apr. 26, 1863.	Lower 3d, left thigh, flesh.	May 11, 1863.	.....	May 17, 1863.	Both ends in wound.	Died May 20, 1863.

Of the branches of the femoral artery the external pudic was ligated in one, the profunda in twenty-two, and the perforating artery in six instances.

Ligation of the External Pudic Artery.—Case 1156.—Sergeant J. H. Warford, A, 124th New York, age 23, was wounded at Sailor's Creek, Virginia, April 6, 1865, in the right thigh about two inches below Poupart's ligament; June 12th, hæmorrhage from external pudic artery; ligation of artery in wound; no recurrence of hæmorrhage. Patient was discharged August 26, 1865. (*Second Surg. Vol.*, page 326, Case 940.)

Ligation of the Profunda Femoris.—Twenty-two cases, with five recoveries and seventeen deaths were reported. Fourteen were ligations, after amputations, on the face of the stump.

Table CXLII.

Summary of Twenty-two Cases of Ligations of the Profunda Femoris.

[Recoveries, 1—5; Deaths, 6—22.]

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
1	*Bedingfield, R. W.*, Serg't, I, 60th Ga., age 18.	July 9, 1864.	Flesh wounds of both thighs.	Aug. 16, 1864.	False aneurism r't thigh.	Aug. 16, 1864.	Profunda, both ends in wound. A. A. Surg. J. H. Barthelf.	Exchanged October 25, 1864.
2	Casey, P., Pt., H, 1st Col. Troops.	July 10, 1863.	Fracture of right femur; prim. amp.	July 16, 21, 25, 26, 1863.	From stump.	July 26, 1863.	On face of stump. A. A. Surgeon J. C. Shimer.	Discharged December 10, 1863.
3	Crawford, E., Pt., F, 105th Ohio, age 20.	Sept. 19, 1863.	Right ankle jt.; Oct., amp. leg; Aug. 5, 1864, amp. thigh.	Aug. 14, 15. 1864.	From stump	Aug. 15, 1864.	Profunda on face of stump.	Discharged Mar. 18, 1865.
4	Michaelis, T., Corp'l, B, 140th New York, age 27.	May 8, 1864.	Right thigh, upper third.	July 4, 1864.	Profunda	July 4, 1864.	Profunda, proximal end in wound.	Discharged May 31, 1865.
5	Shawgo, G., Pt., A. 121st Penn., age 21.	Apr. 1, 1865.	Right femur; prim. amp. thigh.	Apr. 7, 1865.	Profunda.....	Apr. 7, 1865.	On face of stump ..	Discharged June 15, 1865.
6	Bodley, E., Pt., 39th Indiana, age 28.	Sept. 19, 1863.	Left leg; amputation thigh September 21.	Sept. 28, 1863.	Profunda....	Sept. 28, 1863.	Profunda on face of stump.	Died September 28, 1863.
7	Carlton, C. C., Pt., B, 1st Massachusetts Artillery, age 35.	May 19, 1864.	Left knee joint; amputation thigh May 22.	May 26, 1864.	Anastomotic	May 27, 1864.	Profunda on face of stump.	Died May 30, 1864.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
8	Clark, J., Pt., H, 7th N. Y. Heavy Artillery, age 24.	June 16, 1864.	Right knee joint; primary amp. thigh.	June 27, 1864.	Profunda	June 27, 1864.	Profunda on face of stump.	Died October 9, 1864.
9	Dawson, F., Bugler, I, 1st Cavalry, age 24.	Oct. 19, 1864.	Fracture left knee joint; Oct. 22, amp. thigh.	Oct. 26, 1864.	Profunda..... ..	Oct. 26, 1864.	Profunda on face of stump.	Died November 9, 1864.
10	Doty, N., Pt., E, 102d Penn., age 33.	Sept. 19, 1864.	Condyle of left fem.; Sept. 28, amp. thigh.	Sept. 30, 1864.	Branch of profunda	Sept. 30, 1864.	Ligated on face of stump.	Died November 7, 1864.
11	Folensbee, C. M., Pt., B, 157th New York, age 16.	Dec. 6, 1864.	Right knee joint; Dec. 9, amp. thigh.	Dec. 19, 1864.	Branch of profunda	Dec. 19, 1864.	Artery tied on face of stump.	Died December 26, 1864.
12	Galiger, M., Serg't, G, 73d N. Y., age 22.	July 2, 1863.	Fracture left femur; July 5, amp. thigh.	July 6, 1863.	Profunda.....	July 6, 1863.	Profunda on face of stump.	Died July 8, 1863.
13	Gibson, E. H., Pt., A, 14th New Jersey, age 15.	July 8, 1864.	Fracture of right femur, upper third.	July 19, 1864.	Circumflex	July 19, 1864.	Circumflex branch of prof., both ends in wound. A. A. Surg. T. J. Dunott.	Died July 20, 1864.
14	Gilkey, E., Pt., C, 17th Maine, age 27.	June 19, 1864.	Right thigh, upper third.	July 5, 1864.	.....	July 5, 1864.	Profunda in wound. Ass't Surg. A. Delany, U. S. V.	Vein also lig. Died July 7, 1864; recurrence of hæm.
15	Jenkins, J. H., Serg't, B, 89th Ohio, age 24.	Feb. 25, 1864.	Left knee j't; amp. thigh February 29.	Mar. 12, 1864.	Profunda.....	Mar. 12, 1864.	Profunda on face of stump.	Died March 16, 1864; pyæmia.
16	Labrie, O., Pt., H, 126th Ohio, age 23.	July 9, 1864.	Left thigh; amputation July 12.	July 15, 1864.	Branch of profunda	July 15, 1864.	On face of stump ..	Died July 22, 1864.
17	Lowe, J. T., Lieut, D, 12th N. Jersey.	Oct. 14, 1863.	Wound of left thigh	.....	.....	.....	Profunda, both ends in wound.	Died October 30, 1863.
18	Murphy, M., Pt., G, 5th Kentucky.	Nov. 25, 1863.	Left thigh, flesh, gangrene.	Jan. 26, 1864.	Profunda.....	Jan. 26, 1864.	Profunda. Surgeon A. H. Stephens, 6th Ohio.	Died Jan. 27, 1864.
19	Pattison, T., Corp'l, D, 5th Mich., age 32.	May 5, 1864.	Flesh wound of left thigh.	July 13, 1864.	Branch of profunda	July 13, 1864.	One end in wound; hæm. recurred.	Died July 20, 1864.
20	Sturgis, J., Corp'l, G, 85th Pennsylvania.	Aug. 16, 1864.	Both thighs, right femur injured.	Nov. 1, 1864.	Profunda.....	Nov. 1, 1864.	Profunda, in continuity. A. A. Surg. J. C. Morton.	Died November 6, 1864.
21	Weiler, J., Corp'l, K, 40th N. Y., age 20.	May 24, 1864.	Fracture right thigh; prim. amputation.	May 31, 1864.	Branch of profunda	May 31, 1864.	On face of stump....	Died May 31, 1864.
22	Wells, E., Pt., I, 12th Iowa.	Dec. 16, 1864.	Right knee; amp. thigh Dec. 16.	Dec. 21, 1864.	Profunda.....	Dec. 21, 1864.	On face of stump....	Died December 21, 1864.

Of the branches of the profunda the perforating arteries were ligated in six instances; all the cases terminated in death:

Cases 1157-1162.—Private T. B. Benedict, D, 7th Connecticut, age 32; received a shot flesh wound of right thigh May 10, 1864; hæmorrhage occurred from one of the posterior perforating arteries on June 9th, which was ligated; no recurrence of hæmorrhage; death May 3, 1865, of pneumonia.—Lieutenant *J. Coote*, F, 10th Alabama; wounded May 5, 1862, through left knee joint; May 20th, amputation of thigh; May 23d, hæmorrhage from branch of inferior perforating artery; vessel ligated; death May 25, 1862.—Private T. Hagleman, D, 41st Ohio, age 49; wound of right thigh December 16, 1864; hæmorrhage from superior perforating artery December 29, 1864; vessel ligated at proximal end by A. A. Surg. S. W. Blackwood; died January 15, 1865.—Private J. J. Smith, F, 11th Virginia; fracture of left femur October 19, 1864; amputation of thigh October 20th; November 1st, secondary hæmorrhage; perforating artery ligated on face of the stump on the same day; death November 9, 1864.—Surg. H. S. Wheeler, B, 2d Connecticut H. Artillery, age 29; fracture of condyle of femur October 19, 1864; amputation October 26th; hæmorrhage November 1st from perforating artery, which was ligated on face of the stump; death November 11, 1864.—Private W. F. Young, A, 114th New York, age 26; wound of left knee October 19, 1864; amputation on same day; October 30th, hæmorrhage from inferior perforating artery; October 31st, ligated on face of stump; died November 27, 1864.

Twenty-four cases of ligations of muscular and other minor branches of the femoral artery were reported; twenty-two were ligations on the face of the stump.

Table CXLIII.

Summary of Twenty-four Ligations of Muscular and other small Branches of the Femoral Artery.

[Recoveries, 1—6; Deaths, 7—24.]

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
1	Atkins, C. S., Serg't, D, 6th Kansas, age 22.	July 27, 1864.	Right knee j't; prim. amputation thigh.	Aug. 2, 1864.	Muscular branch ..	Aug. 2, 1864.	Muscular branch tied on face of stump.	Discharged in 1865.
2	Cole, E., Pt., F, 120th New York, age 24	July 2, 1863.	Right leg; prim. amputation leg.	July 11, 1863.	Muscular branch ..	July 11, 1863.	Muscular branch on face of stump.	Discharged April 20, 1864.
3	Dunlap, W., Pt., I, 9th N. H., age 24.	July 30, 1864.	Right thigh; prim. amputation.	Nov. 22, 1864.	Branch of femoral..	Nov. 22, 1864.	Branch of femoral on face of stump.	Discharged May 15, 1865.
4	James, J., Pt., I, 2d Iowa, age 20.	Nov. 19, 1864.	Through left knee; Nov. 28, amp. thigh.	Dec. 3, 1864.	.....	Dec. 3, 1864.	Branch of femoral ..	Discharged April 20, 1865.
5	Schrabaskie, M., Pt., B, 183d Pennsylvania, age 46.	Apr. 1, 1865.	Through right patella; April 8, amputation thigh.	June 7, 1866.	.....	June 7, 1866.	Muscular artery tied.	Recovered.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
6	Swayne, W., Colonel, 43d Ohio, age 30.	Feb. 2, 1865.	Right knee; prim. amputation thigh.	Feb. 13, 1865.	Branch of femoral	Feb. 13, 1865.	On face of stump....	Recovered.
7	Anderson, W. G., Pt., G, 114th Pennsylvania, age 16.	Dec. 13, 1862.	Right knee j't; January 11, amp. thigh.	Jan. 13, 15, 17, 1863.	From stump	Jan. 17, 1863.	Muscular branch on face of stump.	Died Jan. 17, 1863.
8	Carroll, L., Serg't. H, 1st Delaware, age 33.	Oct. 27, 1864.	Fracture femur, upper third.	.....	....	.....	Branches of femoral; hæmorrhage.	November 11, amp at hip. Died Nov. 19, 1864.
9	Davis, H. C., Pt., I, 46th Indiana.	May 1, 1863.	Fract. of femur, profunda injured; amp.	May 17, 1863.	From stump	May 17, 1863.	Small branch on face of stump.	Died May 18, 1863.
10	Fisher, G. A., Pt., A, 8th New York Artillery, age 19.	June 2, 1864.	Right knee j't; June 15, amputa'n thigh.	June 22, 1864.	Muscular branch..	June 22, 1864.	On face of stump. A. A. Surg. D. L. Haight.	Died June 23, 1864; pyæmia.
11	Foster, R., Capt., K, 1st New Jersey, age 39.	May 10, 1864.	Left knee joint; May 27, amputa'n thigh.	June 4, 1864.	Muscular branch..	June 4, 1864.	On face of stump. A. A. Surg. F. H. Colton.	Died June 14, 1864.
12	*Foust, J.*, Pt., N. C. Artillery, age 37.	Mar. 27, 1865.	Left knee; June 17, amputation thigh.	June 17, 1865.	From stump	June 17, 1865.	Small branch on face of stump.	Died July 25, 1865.
13	Geller, M., Pt., D, 48th N. Y., age 37.	June 30, 1864.	Left knee j't; July 4, amputation thigh.	Aug. 5, 1864.	Muscular branch..	Aug. 5, 1864.	Muscular branch on face of stump.	Died August 29, 1864.
14	Hammond, A., Pt., H, 111th New York, age 47.	Apr. 2, 1865.	Left knee joint; Apr. 6, amputat'n thigh.	Apr. 11, 1865.	Muscular branch..	Apr. 11, 1865.	Muscular branch on face of stump.	Died April 16, 1865; pyæmia.
15	Hayer, G., Pt., K, 6th New York Heavy Artillery, age 27.	May 19, 1864.	Left knee j't; June 16, amputa'n thigh.	June 28, 1864.	Muscular branch..	June 28, 1864.	Muscular branch on face of stump.	Died June 29, 1864; pyæmia.
16	Hays, A. H., Pt., B, 142d Penn., age 23.	Dec. 13, 1862.	Fracture left tibia; Dec. 25, amp. thigh.	Jan. 7, 1863.	Branch of femoral.	Jan. 7, 1863.	Small branch on face of stump.	Died January 10, 1863.
17	Knowlton, A. W., Pt., F, 93d N. Y., age 22.	May 5, 1864.	Left knee joint; May 14, amputa'n thigh.	June 1, 1864.	Muscular branch..	June 1, 1864.	On face of stump. Ass't Surg. W. F. Norris, U. S. A.	Died June 4, 1864; pyæmia.
18	Mars, H., Pt., G, 5th New York, age 24.	Mar. 31, 1865.	Right knee joint; Apr. 9, amp. thigh.	Apr. 10, 1865.	Muscular branch..	Apr. 10, 1865.	Muscular branch on face of stump.	Died April 22, 1865; pyæmia.
19	Michaelis, S., Pt., E, 9th Maine, age 21.	June 25, 1864.	Flesh wound of both thighs.	July 30, 1864.	Branch of femoral.	July 30, 1864.	Both ends in wound. Ass't Surg. E. Curtis, U. S. A.	Died August 4, 1864.
20	Spencer, J., Pt., G, 48th Penn., age 19.	May 9, 1864.	Right knee j't; May 16, amputa'n thigh.	May 24, 1864.	From stump	May 24, 1864.	Branches ligated on face of stump.	Died May 31, 1864.
21	Sterling, E. E., Corp'l, E, 143d Pennsylvania, age 32.	May 9, 1864.	Right leg; May 10, amputation thigh.	May 22, 1864.	Branch of femoral.	May 22, 1864.	Small branch on face of stump.	Died Aug. 12, 1864; pyæmia.
22	Townsend, E., Pt., F, 5th N. H., age 35.	June 2, 1864.	Left knee j't; June 21, amputa'n thigh.	June 4, 1864.	Small branch of femoral.	June 4, 1864.	On face of stump ...	Died July 1, 1864.
23	Weismiller, C., Pt., B, 12th Penn. Res., age 22.	Dec. 13, 1862.	Head of left tibia; Dec. 25, amp. thigh.	Dec. 26, 1862.	Branches of femoral.	Dec. 26, 1862.	Branches ligated on face of stump.	Died December 27, 1862.
24	Yeagher, F., Corp'l, C, 26th Mich., age 44.	June 17, 1864.	Right knee joint; prim. amp. thigh.	July 2, 1864.	Muscular branch..	July 3, 1864.	On face of stump....	Died July 5, 1864.

Ligations of the Popliteal Artery.—Thirty-six cases, with eight recoveries and twenty-eight deaths, a mortality rate of 77.7 per cent., were reported. Six of the operations were performed, after amputations, on the face of the stump.

Table CXLIV.

Summary of Thirty-six Ligations of the Popliteal Artery.

[Recoveries, 1—8; Deaths, 9—36.]

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
1	Ditters, W., Pt., H, 42d Illinois, age 27.	May 14, 1864.	Right popliteal space	June 6, 1864.	Popliteal	June 6, 1864.	Both ends in wound. Asst. Surg. B. E. Fryer, U. S. A.	Discharged August 16, 1865.
2	*Fields, B.*, Pt., C, 27th N. C., age 21.	Sept. 17, 1862.	Fracture right leg; Nov. 28, amp. leg.	Dec. 1, 1862.	Popliteal....	Dec. 1, 1862.	On stump. Surg. H. S. Hewit, U. S. V.	Hæm. recur'd. Exch. February 28, 1863.
3	Kansche, G. D., 20th New York, age 35.	Sept. 17, 1862.	Shot laceration of popliteal space.	Sept. 17, 1862.	Popliteal.....	Sept. 17, 1862.	Card. end in wound; hæms. rec'd.	Discharged August 13, 1863.
4	Kracher, J. P., Pt., D, 6th N. Y. H. Art., age 35.	June 1, 1864.	Grapeshot, left thigh, near knee.	July 24, 1864.	Popliteal	July 24, 1864.	One end ligated in wound; no recurrence.	Discharged March 15, 1865.
5	Lo[illegible]z, J., Pt., I, 105th Pa., age 26.	Mar 25, 1865.	Fracture of left fibula.	Apr. 7, 10, 11, 12, 1865.	Posterior tibial and peroneal.	Apr, 12, 1865.	Pop. above its bifurcation. Surg. B. B Wilson, U. S. V.	Discharged August 4, 1865.
6	Maher, C., Pt., A, 64th N. Y., age 20.	Mar. 25, 1865.	Upper third of tibia, post. tibial injured.	Apr. 5, 1865.	Posterior tibial ..	Apr. 5, 1865.	Popliteal, in cont. Surg. T. R. Crosby, U. S. V.	Discharged October 4, 1865.
7	Smith, P. D., Pt., C, 8th Iowa.	Mar. 19, 1864.	Right ankle; gangrene in wound.	May 6, 1864.	Posterior tibial....	May 6, 1864.	In lower portion popliteal, in cont. A. A. Surg. D. McLean.	Discharged March 21, 1865.
8	Taft, E. P., Lt. Col., 9th N. Y. H. Art., age 32.	July 9, 1864.	Tibia and fibula, middle third; July 22, amputation leg.	July 24, 1864.	Popliteal	July 24, 1864.	Popliteal, on face of stump.	Mustered out November 28, 1864.
9	Bartholomew, J. C., Lieut., K, 20th Ind., age 30.	May 16, 1864.	Fracture of left leg	May 16, 1864.	Popliteal.....	May 16, 1864.	Popliteal.....	Died May 29, 1864; tetanus.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
10	Bernhard, A., Pt., K, 4th Ohio Cav., age 35.	Feb. 25, 1864.	Fracture right leg; prim amp. leg.	Mar. 5, 1864.	Anterior tibial	Mar. 5, 1864.	Popliteal, in middle. A. Surg. J. G. Buchanan, 125th Ohio.	Died March 22, 1864; pyæmia.
11	*Brennan, J.*, Capt., A, 16th Va., age 29.	Oct. 27, 1864.	Cond. of femur and right pop. artery.	Nov. 10, 1864.	Popliteal.....	Nov. 14, 1864.	In w'nd, pop. space. A. A. Surg. C. Eberhardt.	Died Nov. 25, 1864, during amp. thigh.
12	*Burnham, W., G*, 8th Louisiana, age 35.	Oct. 19, 1864.	Right tibia	Oct. 19, 1864.	Popliteal.....	Oct. 19, 1864.	In wound; Nov. 5, amp. thigh.	Died November 21, 1864.
13	Corrigan, H. McQ., Major, 9th N. Y. Cav., age 27.	May 12, 1864.	Right tibia, anterior tibial injured; amp. at knee, prim.	May 18, 1864.	Popliteal.....	May 18, 1864.	On face stump. Surg. A. Heger, U. S. A.	Died May 28, 1864.
14	Elliott, J. E., Corp'l, E, Pa. Cav., age 24.	Apr. 2, 1863.	Through left leg ...	Apr. 19, 1863.	Recurred 5 times.	Apr. 29, 1863.	Popliteal; hæm. recurred; amp. thigh.	Died May 5, 1863.
15	Fletcher, J. M., C'p'l, C, 39th Mass., age 28.	June 18, 1864.	Flesh wound of right knee.	Aug. 14, 1864.	Popliteal	Aug. 14, 1864.	Both ends in wound. A. A. Surg. J. M. McGrath.	Died Aug. 14, 1864; typhoid fever.
16	Gray, W., E, 18th Infantry, age 26.	Dec. 30, 1862.	Popliteal region....	Jan. 12, 1863.	Popliteal artery ..	Jan. 12, 1863.	Both ends in wound	Died January 22, 1863.
17	Gwinn, E., Pt., B, 138th Pa., age 21.	July 9, 1864.	Left knee joint; July 12, amputation.	July 22, 1864.	Popliteal.....	July 22, 1864.	Popliteal, on face of stump.	Died July 22, 1864; pyæmia.
18	Knight, A., Pt., L, 2d Ill. Cav., age 24.	May 4, 1862.	Left femur, popliteal wounded.	Sept. 6, 1862.	.....	Sept. 10, 1862.	Popliteal, both ends in wound.	Died September 29, 1862.
19	Lee, A. F., Corp'l, A, 24th Ohio, age 22.	Feb. 25, 1864.	Upper third right tibula.	Mar. 1, 2, 1864.	Peroneal artery ...	Mar. 2, 1864.	Pop. ligated. A. S'rg. T. A. McGraw.	Relig. Mar. 5. Died Mar. 8, 1864; gang.
20	Leonard, J., Pt., L, 7th N. Y. H. Art., age 21.	May 30, 1864.	Flesh wound upper portion of left leg.	July 3, 1864.	Posterior tibial ..	July 3, 1864.	Popliteal; hæmorrhage recurred.	Amputation thigh. Died July 23, 1864.
21	Lynch, J., Corp'l, K, 146th N. Y., age 34.	May 10, 1864.	Flesh w'd popliteal region left leg.	May 17, 1864.	.....	May 17, 1864.	Poplit'l lig'd. Ass't Surg. C. A. McCall, U. S. A.	Died May 23, 1864; pyæmia.
22	McNulty, J., Pt., E, 22d Michigan.	Sept. 20, 1863.	Both knee joints	.....	.....	October, 1863.	Poplit'l and branch, with popliteal vein.	Died October 15, 1863.
23	Mathews, S., Pt., A, 93d Pa., age 28.	May 15, 1864.	Left leg; prim. amp. at knee joint.	May 30, 1864.	Repeated hæm. to June 12.	June 12, 1864.	Popliteal ligated on base of stump.	Died June 17, 1864; pyæmia.
24	Powers, T., Pt., G, 140th New York.	May, 1864.	Right leg and left foot.	May, 1864.	.....	May, 1864.	Popliteal ligated, in cont.	Died May 14, 1864.
25	Reynolds, H. H., Pt., F, 1st Mich. Cav., age 25.	Sept. 4, 1864.	Left knee j'nt; Sept. 18, amp. thigh.	Sept. 19, 1864.	Popliteal	Sept. 19, 1864.	Popliteal on face of stump.	Died September 30, 1864; pyæmia.
26	*Seldon, B.*, Pt., H, 9th Virg. Cav., age 23.	July 8, 1863.	Popliteal space, popliteal artery divided; left.	July 17, 27, 1863.	Popliteal artery...	July 27, 1863.	Proximal end in w'd. A. A. Surg. W. S. Adams.	Died August 2, 1863; pyæmia.
27	Sharon, P., Pt., I, 153d New York.	Sept. 19, 1864.	Fracture of head of tibia.	Oct. 1, 5, 12, '64.	Anterior tibial	Oct. 12, 1864.	Popliteal; hæm. recurred.	Oct. 18, amp. thigh. Died Oct. 18, 1864.
28	Smith, A. M., Serg't, F, 20th Maine.	May, 1864.	Poplitealart'y w'ded	May, 1864.	Popliteal.....	May, 1864.	Popliteal ligated on field.	Died May 22, 1864.
29	Smith, F., Pt., B, 1st Mass. Art., age 28.	May 23, 1864.	Right leg and left thigh.	June 17, 1864.	Post. tib.; art'y ligated; hæm. recurred.	June 29, 1864.	Poplit'l. A. A. Surg. H. M. Dean.	Died June 29, 1864.
30	Taber, J. A., Pt., E, 5th Mich., age 23.	Mar. 31, 1865.	Right leg in middle third.	Apr. 10, 1865.	Post. tib. or interosseous.	Apr. 12, 1865.	Poplit'l lig'd; hæm. recur'd. Surg. J. C. McKee, U. S. A.	Died April 18, 1865.
31	Thompson, J. A., Corp'l, K, 10th Indiana, age 27.	Aug. 3, 1864.	Left leg; Sept. 3, amp. upper third.	Oct. 4, 1864.	Popliteal.....	Oct. 4, 1864.	Popliteal, in continuity.	Died Oct. 4, 1864.
32	Vann, D., Pt., B, 8th N. Y. H. Art., age 18.	June 3, 1864.	Left knee, popliteal artery injured.	.....	.....	June 16, 1864.	Popliteal. Surg. R. B. Bontecou, U. S. V.	June 20, amp. thigh. Died June 22, 1864.
33	Walker, M. K., colored servant, 58th Pa., age 13.	June 3, 1864.	Popliteal space, popliteal art. wounded.	June 25, 26, '64.	Popliteal.....	June 26, 1864.	Popliteal, one end in wound. Surg. R. B. Bontecou, U. S. V.	Died July 3, 1864.
34	Wick, J. C., Pt., C, 155th Penn., age 22.	Mar. 25, 1865.	Flesh wounds of both thighs.	May 23, 1865.	Popliteal.....	May 23, 1865.	Both ends in wound. Ass't Surg. A. Delany, U. S. V.	June 14, amp. thigh. Died June 20, 1865.
35	Wild, C. B., Corp'l, E, 114th New York.	Sept. 19, 1864.	Right pop. space	Oct. 1, 1864.	Popliteal.....	Oct. 1, 1864.	Popliteal; hæm. rec. Oct. 12.	Oct. 12, amp. thigh. Died Oct. 13, 1864.
36	*Wilkins, T. E.*, Corp'l, A, 49th Virginia.	Oct. 19, 1864.	Fracture of fibula, tibial arteries inj'd.	.....	Ant. tibial; tibial ligated.	... .	Popliteal lig.; amp. thigh Oct. 23.	Died Nov. 12, 1864.

Of the branches of the popliteal the articular artery was ligated in three instances; two of the cases terminated in death:

Ligations of the Articular Branch.—Cases 1163–1165.—Private A. Shaw, I, 16th Massachusetts, aged 19, wounded May 3, 1863; ball entered external condyle of right femur and was cut out at a point three inches above; hæmorrhage; June 11, ligation of articular branch; admitted into Armory Square Hospital, Washington; discharged December 14, 1863.—Sergeant J. W. Long, I, 8th Kansas, aged 23; shot fracture right leg, December 16, 1864; Dec. 17, amputation at knee joint; Dec. 18, hæmorrhage from internal articular artery; ligation on face of stump on same day; Dec. 25, hæmorrhage external articular; death Dec. 26, 1864.—Private S. Lyon, C, 84th Indiana, age 23; shot fracture of right tibia, Chickamauga, September 19, 1863; hæmorrhages October 2d, 3d, probably from popliteal artery; ligation of articular branch October 3; great prostration from extensive loss of blood; gangrene; October 6, amputation of thigh at junction of middle and lower thirds; death October 8, 1863.

Ligations of the Anterior Tibial Artery.—Forty-seven cases come under this group; twenty-six patients survived the operation, twenty-one perished, a mortality rate of 44.6 per cent. In seven cases with four recoveries and three deaths the posterior tibial artery was likewise tied. Fifteen were operations on the face of the stump after amputation in the leg.

TABLE CXLV.

Summary of Forty-seven Ligations of the Anterior Tibial Artery.

[Recoveries, 1—26; Deaths, 27—47.]

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF HÆMORRHAGE.	PROBABLE SOURCE OF HÆMORRHAGE.	DATE OF OPERATION.	OPERATION, OPERATOR.	RESULT.
1	Bartley, J. P., Pt., B, 38th Ind., age 20.	Mar. 3, 1864.	Fracture bones left foot.	.....	....	Mar. 9, 1864.	Ant. and post. tibial. A. A. Surg. J. Grant.	Discharged Apr. 11, 1865.
2	Boebme, C., Pt., E, 52d N. Y., age 33.	Apr. 2, 1865.	Fracture left ankle; 4th, amp. leg.	Apr. 10, 11, 1865.	Anterior tibial	Apr. 11, 1865.	Both tibials, on face of stump.	Discharged Nov. 14, 1865.
3	Brewster, C. C., Capt., D. 10th Conn., age 45.	May 16, 1864.	Flesh, left leg	May 21, 1864.	Anterior tibial ...	May 21, 1864.	Anterior tibial, one end in wound.	Discharged Sept. 19, 1864.
4	[1] *Bullet, R. W.*, Pt., H, 22d N. C.	May 23, 1864.	Fracture right foot; gangrene.	June—, ——.	.....	June 3, 1864.	Ant. tibial in wound. A. Surg. R. O'Leary, P. A. C. S.	Recovered July 23, 1864.
5	Condon, T., Corp'l, C, 2d New York Artillery, age 21.	Aug. 16, 1864.	Flesh, right leg, middle third.	.....	.....	Aug. 26, 1864.	Anterior tibial, both ends in wound. A. A. Surg. W. F. Atlee.	Discharged July 26, 1865.
6	Elmer, A., Pt., I, 69th Pa., age 21.	June 18, 1862.	Fract. tibia, ant. tibial artery divided.	... .	.....	.....	Anterior tibial	Discharged Jan. 7, 1865.
7	Furrow, G., K, 10th Mass., age 20.	May 5, 1864.	Fracture right tibia, middle third.	June 8, 9, 1864.	Anterior tibial	June 9, 1864.	Anterior tibial, both ends in wound.	Discharged Dec. 6, 1864.
8	Galliger, M., Pt., L, 1st W. Va. Cav., age 31.	Apr. 6, 1865.	Right ankle	.....	.....	Apr. 20, 1865.	Ant. tib., one end in wound. A. A. Surg. J. Sweet.	Discharged Aug. 25, 1865.
9	Goodrich, L. H., Pt., B, 6th Vt., age 30.	May 4, 1863.	Fract. left leg, middle; 7th, amp.	May 10, 1863.	.....	May 10, 1863.	Ant. tibial, on face of stump.	Discharged Mar. 19, 1864.
10	Gould, J., Pt., C, 105th Pa.	July 30, 1864.	Fracture left foot ...	.....	.....	On field.	Anterior tibial	Discharged Mar. 18, 1865.
11	Hoar, J., Pt., G, 144th N. Y., age 17.	July 24, 1863.	Fracture right foot..	July 31, 1863.	Metatarsal	July 31, 1863.	Both tibials. Ass't Surg. W. Thomson, U. S. A.	Duty Apr. 11, 1864.
12	Johnson, W. H., Capt., F, 144th New York, age 27.	Feb. 10, 1865.	Left external malleolus.	Feb. 17, 1865.	Anterior tibial	Feb. 17, 1865.	Ant. tib., in continuity. Asst. Surg. J. G. Murphy, U. S. V.	Hæmorrhages recurred; Feb. 23, amp. Disch. May 15, 1865.
13	McCracken, R. W., Serg't, C, 170th New York, age 32.	June 17, 1864.	Right fibula, laceration anterior tibial artery; excision.	.. ..	.....	June 22, 1864.	Anterior tibial ligated; July 25, slight hæmorrhage.	Discharged Jan. 20, 1865.
14	Mangan, J., Pt., F, 61st Ohio, age 28.	July 20, 1864.	Flesh, left leg; 22d, amputation.	.....	.....	Aug. 15, 1864.	Ant. tibial, on face of stump.	Discharged 1865; re-amputation 1866.
15	Matters, B., Pt., A, 108th N. Y., age 18.	July 3, 1863.	Fracture right ankle joint; 4th, amp.	July 8, 1863.	.....	July 10, 1863.	Ant. tibial, on face of stump.	Discharged Nov. 3, 1864.
16	Palmer, A., Pt., G, 3d Mich., age 34.	July 3, 1863.	Fracture left ankle; Aug. 15, amp.	Sept. 2, 1863.	.....	Sept. 2, 1863.	Ant. tibial, on face of stump.	Discharged May 31, 1864.
17	Renshaw, J. L., Pt., H, 2d Pa. R., age 28.	June 24, 1864.	Flesh, left leg.....	Aug. 2, 1864.	Anterior tibial	Aug. 2, 1864.	Both ends in wound.	Discharged May 18, 1865.
18	Riley, S., H, 92d Pa., age 19.	June 1, 1864.	Left leg, upper third.	July 8, 1864.	Anterior tibial	July 8, 1864.	Ant. tibial, in wound.	Discharged Feb. 9, 1865.
19	Sampson, I., Corp'l, F, 1st Mass. Cav., age 35.	May 11, 1864.	Right leg; gangrene.	June 28, 1864.	Anterior tibial	June 28, 1864.	Both ends in wound. A. A. Surg. T. Liebold.	Discharged Oct. 16, 1864.
20	Sargent, C., Pt., B, 4th Vt., age 24.	Dec. 13, 1862.	Fracture middle third tibia; Dec. 14, amp.	Feb. 7, 1863.	Both tibials	Feb. 7, 1863.	On face of stump ...	Discharged Aug. 25, 1863.
21	Saulsbury, W., Pt., K, 39th C. T., age 36.	July 30, 1864.	Flesh, lower third right leg.	Sept. 10, 1864.	Anterior tibial	.....	One end in wound; religation.	Hæm.; Jan. 9, 1865, amputation. Disch'ged May 26, 1865.
22	Schmidt, C., Corp'l, K, 39th N. Y., age 36.	May 5, 1864.	Right tibia, middle third.	.....	.....	May 23, 1864.	Anterior tibial. Surg. E. Bentley, U. S. V.	1865, amputation leg. Disch. July 14, 1865.
23	Smith, H., Pt., E, 11th Vt., age 19.	Sept. 13, 1864.	Left leg; prim. amp.	Sept. 26, 1864.	Stump	Sept. 26, 1864.	Anterior tibial, on face of stump.	Gangrene. Disch'ed Sept. 14, 1865.
24	Stabenfe'd, J., Pt., A, 3d Wis., age 30.	Sept. 17, 1862.	Fracture right foot; Oct. 3, amp. leg.	Oct. 8, 1862.	Anterior tibial	Oct. 8, 1862.	On face of stump ...	Discharged March 6, 1863.
25	Summers, P., Pt., A, 2d Vermont, age 29.	May 5, 1864.	Fracture tibia, right.	June 26, 1864.	Anterior tibial ..	June 26, 1864.	One end in wound. A. A. Surg. J. F. Strawbridge.	Discharged May 13, 1865.
26	*Weaver, L.*, Pt., G, 4th Virginia, age 23.	July 2, 1863.	Both legs (also face).	July 14, 1863.	Anterior tibial	July 14, 1863.	Both ends in wound.	Paroled Nov. 12, 1863.
27	Babcock, E., Pt., K, 1st Mich. C., age 39.	July 3, 1863.	Fract. fibula, left; excision; gangrene.	Oct. 19, 1863.	Anterior tibial; sloughed.	Oct. 19, 1863.	Both ends in wound. A. A. Surg. J. H. Jamar.	Died Oct. 19, 1863. *Spec.* 2611, A. M. M.
28	Boobar, J., Pt., K, 8th Maine, age 49.	May 20, 1864.	Middle third, left fibula.	July 10, 1864.	Anterior tibial	July 10, 1864.	Both ends in w'd. A. A. Surg. T. Liebold.	Died Aug. 28, 1864.
29	Brommel, W., E, 15th N. Y. Art., age 30.	Mar. 31, 1865.	Left leg, flesh, lower third.	.....	Anterior tibial ...	.....	Anterior tibial. A. A. Surg. S. W. Briggs.	Died May 2, 1865; hæmorrhage.
30	Bumpus, M., Pt., A, 5th Maine, age 29.	May 10, 1864.	Right ankle joint....	May 19, 1864.	Branch tibial.....	May 19, 1864.	One end in wound ...	May 24, amputation. Died May 29, 1864; toxæmia.
31	Clark, E. J., Pt., I, 8th Mich., age 36.	May 10, 1864.	Fracture left foot; June 4, amp. leg.	June 6, 1864.	Anterior tibial	June 16, 1864.	On face of stump ...	Hæm. Died June 16, 1864; hæm.; gang.
32	Clark, J. W., Serg't, I, 129th Ind., age 37.	July 19, 1864.	Fracture left leg; prim. amp. upper third.	July 19, 1864.	.....	July 19, 1864.	Anterior tibial, on face of stump. Surg. A. M. Wilder, U. S. V.	Gangrene. Died Sept. 19, 1864.
33	Deuer, C., Pr., B. 6th Connecticut, age 32.	June 3, 1864.	Fracture right leg...	June 12, 1864.	Anterior tibial	June 12, 1864.	One end in wound. A. A. Surg. S. Coloosdian.	Hæm.; amp. of thigh. Died June 18, 1864; exhaustion.
34	Glass, M. C., Serg't, F, 16th Mich., age 24.	Feb. 17, 1865.	Right anterior tibial artery.	Feb. 20, 1865.	Ulceration anterior tibial.	Feb. 20, 1865.	In continuity	Died Feb. 28, 1865; hæmorrhage.
35	Hardfelter, G., Pt., D, 104th Pa.	Sept. 27, 1863.	Foot; prim.; Syme's amputation.	Oct. 3, 1863.	Anterior tibial	Oct. 3, 1863.	In continuity, two inches above stump.	Died Oct. 12, 1863.
36	Jones J., Pt., I, 27th Ind.	Aug. 9, 1862.	Fracture left leg; Aug. 15, amp.	Aug. 18, 1862.	Anterior tibial; interosseous.	Aug. 18, 1862.	Anterior tib., and interosseous, on face of stump.	Died Aug. 20, 1862.
37	Kane, J. A., Corp'l, C, 6th C. T., age 33.	Sept 29, 1864.	Lower third, right fibula.	Oct. 8–12, 1864.	Anterior and posterior tibials.	Oct. 12, 1864.	Both tibials, both ends in wound. A. A. Surg. O. Warner.	Died Oct. 13, 1864.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
38	Kercher, J., D, 7th Mich. Cav.	July 2, 1863.	Right leg, wound of both tibial arteries.	.....	.....	July 29, 1863.	Both tibial arteries ligated.	Hæmorrhage recurred. Died Aug 10, 1863.
39	McCauley, S. E., Pt., H, 28th Iowa, age 19.	Oct. 19, 1864.	Fracture right tarsus; Nov. 7, amp. leg.	Nov. 11, 1864.	Anterior tibial artery.	Nov. 11, 1864.	On face of stump....	Died Nov. 19, 1864; hæmorrhage.
40	Partridge, G. V., Saddler, B, 4th Massachusetts Cav., age 21.	April 2, 1864.	Fracture left tibia, and injury ant. tibial artery.	April 9, 1864.	Anterior tibial	April 9, 1864.	In wound, one end; April 27, hæmorrhage recurred.	Died May 2, 1864; hæmorrhage; pyæmia.
41	*Poiten, W. F.*, Pt., C, 9th Miss., age 24.	Nov. 30, 1864.	Right tibia, middle third; Mar. 19, '65, amputation.	Mar. 23, 1865.	Anterior tibial	Mar. 23, 1865.	On face of stump....	March 24, 1865, amp. thigh. Died April 20, 1865.
42	Robbins, E. H., Corporal, F, 15th Massachusetts, age 29.	May 6, 1864.	Fracture fibula, inj. ant. tibial artery.	May 31, 1864.	Anterior tibial	May 31, 1864.	In continuity. A. A. Surg. J. Ransom.	June 2, amputated thigh. Died July 15, 1864.
43	Schreiber, A., Pt., A, 50th Penn., age 17.	May 10, 1864.	Fracture right tibia.	May 19, 1864.	.....	May 19, 1864.	Tibial, in wound....	May 19, amp. knee jt. Died June 9, 1864; pyæmia.
44	Skiffington, J., Pt., I, 2d New York H. A., age 28.	June 16, 1864.	Flesh, right leg.....	July 28, 1864.	Anterior tibial ...	July 28, 1864.	Both ends in wound. A. A. Surg. W. F. Atlee.	Died Aug. 29, 1864; pyæmia.
45	*Wilkins, T. E.*, Corp'l, A, 49th Virginia.	Oct. 19, 1864.	Fract. fib., sev. ant. and post. tib. arts.	.....	.....	.....	Both tibials; Oct 31, amputated thigh.	Died Nov. 12, 1864; hæmorrhage.
46	Williams, E., Pt., F, 136th Penn., age 45.	Dec. 13, 1862.	Ant. tibial art.; Dec. 28, hæm.; amp.	Jan. 1, 1863.	Anterior tibial	Jan. 1, 1863.	On face of stump....	Died Jan. 1, 1863; pyæmia.
47	Williams, H. M., Pt., D, 19th Maine.	July 2, 1863.	Fracture tibia and fib., lower third.	July 12, 1863.	Anterior tibial	July 12, 1863.	In continuity. A. A. Surg. F. T. Maury.	Died July 18, 1863.

Ligations of the branches of the anterior tibial artery were reported—one of the *dorsalis pedis* and two of the interosseous; one of the latter was fatal:

Cases 1166–1168.—Private J. Johnson, D, 4th U. S. Artillery, age 36; fracture of metatarsal bone of great toe May 14, 1864; gangrene; July 20th, ligation of dorsalis pedis, both ends being tied in wound by Surgeon A. Hegner, U. S. A.—Sergeant H. S. Foster, E, 104th New York, age 22; fracture of left os calcis July 1, 1863; amputation of leg July 8th; hæmorrhage from interosseous July 10th; interosseous ligated on face of stump; discharged March 22, 1864.—Captain J. Brown, H, 92d Ohio; shot wound of right foot September 19, 1863; amputation of leg September 27th; hæmorrhage from interosseous September 29th; artery ligated on face of stump on the same day; died October 5, 1863, from effects of hæmorrhage.

Ligations of the Posterior Tibial Artery.—Forty-eight cases were reported in which the posterior tibial artery alone was ligated; twenty-nine ended in recovery, nineteen in death, a fatality rate of 39.5 per cent. Ten were operations on the face of the stump after amputation of the leg.

Table CXLVI.

Summary of Forty-eight Ligations of the Posterior Tibial Artery.

[Recoveries, 1—29; Deaths, 30—48.]

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.
1	Ball, J. D., Corp'l, A, 125th N. Y., age 24.	May 18, 1864.	Flesh, right leg, dividing post. tibial.	May 28, 1864.	Post. tibial.....	May 28, 1864.	Both ends in wound. Asst. Surg. A. Ingram, U. S. A.	Discharged Dec. 29, 1864.
2	Bowers, G., Pt., B, 77th N. Y., age 31.	Sept. 19, 1864.	Fract. right fibula; excision.	Nov. 13, 1864.	Post. tibial.....	.....	Ligation by Asst. Surg. R. F. Wier, U. S. A.	Discharged June 5, 1865.
3	Brazzle, J., Pt., G, 23d Mo., age 18.	Sept. 1, 1864.	Fractured left fibula.	Jan. 1, 3, 9, 1865.	Post. tibial.....	Jan. 9, 1865.	One end in wound. A. A. Surg. A. A. Greene.	Discharged July 26, 1865.
4	*Buckner, J. F.*, 1st C. S. A., age 21.	Apr. 6, 1862.	Right leg	Apr. 16, 1862.	.....	Apr. 16, 1862.	Ligation	Recovery.
5	Cashdollar, L. W., Pt., C, 128th N. Y., age 21.	Sept. 19, 1864.	Fract'd right tibia; 20th, amputated.	Oct. 27, 1864.	.....	Oct. 27, 1864.	On face of stump....	Discharged May 30, 1865.
6	Clark, P., Pt., D, 140th N. Y., age 28.	July 2, 1863.	Right ankle; 3d, amputated.	July 10, 1863.	Post. tibial.....	July 10, 1863.	On face of stump....	Recovery.
7	Collins, O., Pt., D, 151st N. Y., age 32.	Nov. 27, 1863.	Fractur'd left fibula; excision.	Dec. 9, 1863.	Post. tibial.....	Dec. 9, 1863.	In wound, both ends. Surg. E. Bentley, U. S. V.	Discharged Feb. 25, 1865.
8	Copas, W. A., Serg., B, 36th Ohio, age 28.	Sept. 19, 1864.	Fract. middle, right leg; Oct. 26, amp.	Oct. 27, 1864.	Post. tibial.....	Oct. 27, 1864.	On face of stump ...	Discharged June 5, 1865.
9	Dorr, J. A., Pt., E, 136th N. Y., age 20.	May 20, 1864.	Right ankle, severing post. tibial art.	.....	Post. tibial.....	May 20, 1864.	Below int. mallolus. Surg. I. N. Himes, 73d Ohio.	Discharged June 13, 1865.
10	Du Bois, L. A., Lt., I, 120th N. Y., age 24.	Sept. 20, 1864.	Right foot, lacerating post. tibial.	.....	Post. tibial.....	Sept. 20, 1864.	Ligation. Surg. H. F. Lyster, 5th Mich.	Discharged Jan. 10, 1865.
11	Emory, R., Pt., D, 5th Vt., age 33.	May 5, 1864.	Left leg; gangrene..	Aug. 4, 1864.	Post. tibial..... ..	Aug. 4, 1864.	Both ends in wound. A. A. Surg. J. B. Randall.	Discharged Dec. 16, 1864; Aug., 1865, amp.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Hæmorrhage.	Probable Source of Hæmorrhage.	Date of Operation.	Operation, Operator.	Result.

Ligations of Plantar Arteries.—CASES 1169–1171.—Private D. Bailey, G, 3d Iowa Cavalry, age 26; shell wound of right foot June 10, 1864; June 14th, removal of metatarsal bones; external plantar ligated by A. A. Surgeon J. N. Sharp; February, 1865, amputation of leg at lower third; discharged September 11, 1865.—Private J. Betts, K, 2d New Hampshire, age 25; wound of toes of left foot May 27, 1864; May 28, amputation of three toes; June 9, hæmorrhage from plantar; vessel ligated on face of stump; returned to duty July 4, 1864.—Private W. Mockler, G, 81st Pennsylvania, age 47; shot fractune of right foot December 13, 1862; December 26, Chopart's amputation; December 31, hæmorrhage from external and internal planter arteries; ligation on face of stump on the same day; death January 10, 1863.

Of four ligations of the peroneal artery three had fatal terminations; the operation was on the face of the stump after amputation in the leg in one case.

Ligations of the Peroneal Artery.—CASES 1172–1175.—Private O. F. Nash, K, 12th Wisconsin, age 21; shot wound of leg August 23, 1864; August 27, resection of four inches of middle third of left fibula; artery ligated by Surgeon A. J. Miller, 13th Iowa; discharged June 30, 1865.—Private J. E. DeWitt, A, 9th New York Cavalry, age 23; shot fracture of fibula June 21, 1864; bleedings from peroneal June 24, 25; June 25, fractured portion of fibula excised and peroneal artery ligated by A. A. Surgeon O. P. Sweet; death June 25, 1864.—Private C. E. Eastman, F, 9th Maine; shot fracture of left leg July 18th; amputation of leg July 23d; sloughing; hæmorrhage from peroneal; artery ligated on face of stump by Surgeon D. Merritt, 55th Pennsylvania.—Private S. Mitchell, D, 188th Penn., age 23; shot fracture of left fibula June 3, 1864; hæmorrhage from peroneal June 27th; ligation of peroneal and removal of two inches of fibula by A. A. Surgeon A. W. Merrill; death August 17, 1864.

General Remarks on Hæmorrhages and Ligations.—It has been found most convenient in dealing with the cases of hæmorrhage to classify them simply as primary and secondary. While undoubtedly some of these bleedings occurred a short time after the injury and before the period of suppuration had commenced, it was found impossible, from the nature of the records, to eliminate these cases with certainty and accuracy; and inasmuch as such hæmorrhages partook more or less of a primary or secondary character they have been assigned to one or the other of these groups. In the following table are indicated the days on which hæmorrhage first occurred:

TABLE CXLVII.

Table indicating the days on which the first hæmorrhage occurred.

Day after injury on which the hæmorrhage occurred.	Cases.	Head, chest, and upper extremities.	Abdomen, pelvis, and lower extremities.	Day after injury on which the hæmorrhage occurred.	Cases.	Head, chest, and upper extremities.	Abdomen, pelvis, and lower extremities.	Day after injury on which the hæmorrhage occurred.	Cases.	Head, chest, and upper extremities.	Abdomen, pelvis, and lower extremities.
1st day	153	68	85	Forward	788	425	363	Forward	1,166	644	522
2d day	17	5	12	15th day	51	36	15	27th day	13	8	5

12th day	68	43	25	25th day	14	6	8	91 to 100 days	6	.....	6
13th day	64	33	31	26th day	20	13	7	Above 100 days	22	4	18
14th day	52	30	22		1,166	644	522		1,480	780	700

The number of bleedings on the first day was one hundred and fifty-three (153), of which one hundred and ten (110) were hæmorrhages immediately following the injury (strictly primary, see TABLE CXXIV, p. 763), while forty-three (43) occurred at some period within the first twenty-four hours succeeding the injury. Should it be deemed desirable to make a group of intermediary cases, these forty-three cases with those occurring on the second and third days should probably be so classified. Those of the first day undoubtedly

partook of the character of primary hæmorrhage and were results of reaction; as to those of the second and third days the data are insufficient to determine their proper classification. By the fourth day sufficient time had elapsed to allow such changes as result from inflammatory action and which are recognized as productive of secondary hæmorrhage, and it will be noticed that from this day the bleedings perceptibly increase and steadily maintain an upward tendency until the tenth and eleventh days, when the greatest number of hæmorrhages occurred. From this point their frequency gradually and somewhat regularly diminishes until the thirtieth day; after this time they lose their regularity and occur at various intervals, subject to infectious diseases or other peculiar conditions attending each case. Examples of long-deferred hæmorrhages were not rare. In the case of Mullan, cited in TABLE XLIX, on page 650 of the *Second Surgical Volume*, hæmorrhage did not occur until the 264th day, and in the following case the first bleeding took place on the 122d day:

CASE 1176.—J. Brazzle, Co. G, 23d Missouri, aged 18 years, was wounded in both legs, at the battle of Jonesboro', September 1, 1864. He passed through several hospitals, lastly entering No. 8, at New Albany, on December 2d. Assistant Surgeon S. M. Horton, U. S. A., in charge of the latter, reported: "The wound was caused by a minié ball, which entered the left leg at the inner edge of the gastrocnemius muscle, three inches below the knee joint, and passed out at the opposite side of the leg, splintering the fibula in its course. No hæmorrhage took place at the time the wound was received, but three attacks occurred in this hospital, the first on January 1st, the second on January 3d, and the third six days later. The entire loss of blood amounted to about a quart, and its source was the posterior tibial artery, the cardiac extremity of which was ligated at the bottom of the wound, on January 9th, by Acting Assistant Surgeon A. S. Greene. Chloroform constituted the anæsthetic. At the time of the operation the wound was in a healthy condition and the patient was in good health, but looked exsanguineous from the repeated losses of blood. No recurrence of hæmorrhage followed after the operation. Erysipelas, in a mild degree, subsequently attacked the leg, leaving it œdematous. By March 31st the wound had not yet healed, but was discharging unhealthy pus, giving evidence of caries of fibula at the site of the wound." The patient was subsequently transferred as a convalescent to Joe Holt Hospital, and on July 26, 1865, he was discharged from service and pensioned. Examiner G. W Newman, of Bethany, Mo., May 8, 1867, certified to the injury, and added: "From appearance there is yet some detached pieces of the fibula in the wound. The wound is running, the leg is considerably enlarged, and the gastrocnemius muscle contracted so that he cannot bend the foot forward, and walks with difficulty." Two years later the same examiner stated: "The wound has not discharged for ten or twelve months. I think the leg will gradually improve," &c. Examining Surgeon J. Walker, at subsequent dates, reported the wound of the right leg, made by the missile passing through the calf of that limb before entering the left leg, produced no disability, but that the left leg is wasted and its motion much impaired, flexure being confined to a right angle, and the limb requiring to be bandaged to prevent swelling. In May, 1877, the exit wound was reported to be suppurating occasionally. The pensioner was paid September 4, 1880.

In another instance—a case of fracture of the humerus—hæmorrhage from sloughing did not occur until the one hundred and twenty-ninth day, necessitating, at that late period, amputation of the arm:

CASE 1177.—Sergeant M. Bumgardner, Co. B, 9th Iowa, was wounded in the right arm during the assault on Vicksburg, May 22, 1863. He was treated at a field hospital for some weeks, and subsequently at Jefferson Barracks. Surgeon J. F. Randolph, U. S. A., in charge of the latter hospital, made the following report: "The injury consisted of a fracture of the humerus, lower third, and was caused by a round ball. The wound became gangrenous and sloughing, causing hæmorrhage from the brachial artery to the amount of three pints on September 28th. The bleeding was checked, but recurred on October 2d, when circular amputation of the arm was performed at the upper third by Assistant Surgeon H. R. Tilton, U. S. A. Equal parts of ether and chloroform were used as an anæsthetic, from which the patient reacted tardily. At the conclusion of the operation but little hope was entertained of his recovery, and for several days afterwards he continued very weak. Under a treatment, however, of tonics and stimulants, and cold water applications to the stump, the patient subsequently rapidly improved." On December 3, 1863, he was discharged from service and pensioned, and subsequently he was supplied with an artificial arm of the "Lincoln" pattern. In his application for commutation the pensioner described the stump as being in a sound condition. The pensioner was paid June 4, 1881.

Not unfrequently the hæmorrhage following immediately upon the injury ceased spontaneously only to return at a later period, generally in the evening or during the night, at times when the reactionary process, or the wound fever, were most pronounced:

CASE 1178.—Sergeant Christian Geisel, Co. H, 6th Pennsylvania Cavalry, aged 25 years, was wounded at Spottsylvania, May 12, 1864. On May 16th he was admitted into Hammond General Hospital, Point Lookout, Maryland, whence Surgeon A. Heger, U. S. A., reported: "Gunshot wound right side of chest; ball entered in front near the armpit, fracturing the right shoulder blade at the middle; the missile was cut out on May 16th. Secondary hæmorrhage occurred on May 27th, to the extent of eight ounces, from the axillary artery. The fractured lower angle of the shoulder blade was removed. The hæmorrhage did not come from the subscapular artery; the operation to ligate the axillary artery was therefore commenced May 27th, but he

died before it was finished. His comrade said that hæmorrhage to the amount of a gallon occurred immediately after being wounded, but that it ceased spontaneously; the pulse was very low before the operation was commenced; he lost no blood during the operation. Though he was very carefully and slightly put under the influence of chloroform, the same may have hastened his end. No *post-mortem* examination was made; the body was given to his father."

In several instances one or more slight bleedings—"warning bleeding"—preceded the actual hæmorrhage, as in the case of J. Lightfoot, 25th Massachusetts, detailed on page 443 of the *Second Surgical Volume*, and in the example here adduced:

CASE 1179.—Private *A. M. Buzhardt*, Co. K, 14th South Carolina, aged 23 years, received a shot fracture of the upper third of the right femur at the battle of Malvern Hill, July 28, 1864. He was captured and conveyed to hospital at City Point, whence he was transferred to hospital at Alexandria on August 10th. Surgeon E. Bentley, U. S. V., recorded the following result of the injury: "The fracture was very high up and the femur was much shattered. The limb was placed upon a double-inclined plane and the fragments were placed in apposition as nearly as possible. The patient was worn out with exposure and anxiety and had some diarrhœa. Slight hæmorrhages occurred on September 4th and 7th, which readily yielded to pressure. On September 8th a severe hæmorrhage took place, exhausting in amount, from which the patient sank rapidly, and died the same day. The *post-mortem* examination showed the heart to be exsanguineous and without clot; pus in body of the sternum; lungs sound; liver pale and anæmic; other organs sound. Evidences of hæmorrhage from branches of the profunda artery were found."

Instances of hæmorrhage from the distal ends of arteries after ligations of the cardiac end are reported and will be referred to hereafter; but there were also a few instances in which the bleeding occurred from the farther extremity of the wounded blood-vessel, either as primary or secondary hæmorrhage, before operative interference. In the case of Harrison (*Second Surgical Volume*, p. 926, CASE 1869), hæmorrhage from the distal end of the ulnar artery was noted on the tenth day after the injury. In the following case bleeding from the distal end of the anterior tibial artery occurred on the seventh day after the injury:

CASE 1180.—Saddler G. V. Partridge, Co. B, 4th Massachusetts Cavalry, aged 21 years, was wounded in the left leg during a skirmish near Jacksonville, April 2, 1864. The missile, a ball, passed directly through from back to front, fracturing the tibia, comminuting a portion of the internal surface of the bone, and cutting the anterior tibial artery at the middle of the limb. Five days after being wounded the man was admitted to hospital No. 3, at Beaufort, where hæmorrhage occurred to the amount of four ounces from the distal end of the injured vessel on April 9th, on which day the fractured bone was excised and the artery was ligated. The operation was performed by Acting Assistant Surgeon W. A. Greenleaf, who made an incision five inches in length along the line of the internal surface of the tibia and removed eleven pieces of bone, cutting off the points with the chain-saw. At the time of the operation the edges of the wound looked dry and red, and the parts were swollen, very painful, and discharging some. The patient was in good spirits and had a good appetite, but was exhausted from previous loss of blood; pulse 65. Only the lower extremity of the anterior tibial artery was ligated, the vessel having been so extensively destroyed that it was impossible to reach the upper end. Chloroform was used during the operation, from which the patient reacted well. He did well for three days, when chills came on and the wound sloughed. On December 17th sloughing ceased, healthy granulations appeared, and pus discharged freely. Stimulants were duly administered. On April 20th chills were more frequent and at times severe. Decided symptoms of pyæmia developed on April 27th, when a slight hæmorrhage also recurred from the superficial arteries, which was easily controlled by pressure and the application of persulphate of iron. Death resulted from pyæmia May 2, 1864. The history of the case was reported by Assistant Surgeon J. F. Huber, U. S. V.

In the case of Calef, 2d New Hampshire (see CASE 1101, page 756, *ante*), in which a round ball had occluded the proximal end of the divided carotid artery, a false aneurism formed at the distal extremity.

The form of hæmorrhage known as capillary or parenchymatous was occasionally seen, and was marked by a steady leakage of blood from the capillary vessels, often great in amount and frequently resulting in syncope or exhaustion. The discharge had neither the bright scarlet of arterial nor the darker hue of venous blood; it flowed without jets and was often difficult to arrest. When observed as a primary condition, or after a primary operation, it was generally the result of what is known as hæmorrhagic diathesis. In other cases it was due to paralysis of the capillary vessels from inflammatory action. It was most frequently noticed as an accompaniment of pyæmia and osteomyelitis, and was caused by interrupted venous circulation, assisted by the leucothycemic condition of the blood in such cases.

Fifteen cases of this form of hæmorrhage were reported. In the cases of recovery

the bleeding was comparatively slight, and easily controlled by cold, compression, or styptics. Of the nine fatal cases death occurred either as a direct result of the hæmorrhage or from the complications which probably gave rise to the bleeding, as pyæmia, gangrene, erysipelas, and diarrhœa. Of the fifteen cases, capillary hæmorrhage followed amputation in seven instances—with three recoveries and four deaths; and excision in six cases—with one recovery and five deaths.

Four cases of medullary hæmorrhage were noted. Two, occurring from medullary arteries of stumps in pyæmic cases, resulted in death. One appears to have been a case of recurring hæmorrhage from medullary artery of tibia of a patient much debilitated—who finally recovered. The fourth was a case of osteomyelitis of tibia and fibula further complicated by diarrhœa; it ultimately terminated in recovery.

Traumatic Aneurism.—In seventy-four cases the injuries were followed by traumatic aneurism. Twenty-three cases terminated in recovery and fifty-one in death, a mortality rate of 68.9 per cent. Thirty-four, or nearly one-half of all the cases, were aneurisms of the femoral or axillary arteries—twenty of the former and fourteen of the latter.

TABLE CXLVIII.

Summary of Seventy-four Cases of Traumatic Aneurism.

ARTERIES.	Cases.	Recoveries.	Deaths.	TREATMENT.			
				Ligation.		No ligation.	
				Recoveries.	Deaths.	Recoveries.	Deaths.
Common Carotid	5	1	4	.....	3	1	1
External Carotid	1	.....	1	.....	.....	.....	1
Subclavian	3	.....	3	.....	.....	.....	3
Suprascapular	2	1	1	1	1	.....	.....
Axillary	14	3	11	2	10	1	1

Peroneal	2	2	.....	.....	.....	2	.....
Aggregates	74	23	51	13	29	10	22

The aneurisms were either diffuse or circumscribed, and in one instance, the case of Click, detailed on page 541 of the *First Surgical Volume*, time had been given for anastomotic communication. In the case of Hickey (*First Surgical Volume*, page 539), in which ligation of the subclavian was performed for aneurism of the axillary, an aneurism again developed after his discharge from the service; the man is a pensioner and was living in April, 1882; the last report of the pension examiners, in September, 1877, states that he has now "aneurism involving the innominate artery; the thrill is very distinct; radial pulse cannot be felt; he suffers from pain in the chest and can do no labor."

Forty-two of the seventy-four cases were treated by ligation, of which thirteen recovered and twenty-nine died. In the following interesting case of shot wound in the axillary region unattended by fracture, an aneurism appeared three months after the injury, which increased very rapidly. The subclavian was ligated, but on opening the sac the tissues were found infiltrated with blood and disorganized, and the arm was amputated at the

shoulder joint. In PLATE LXXVII, opposite page 808, the anterior as well as the posterior appearance of the tumor is illustrated after a photograph contributed by the operator, Assistant Surgeon J. C. McKee, U. S. A.

CASE 1181.—Private *F. M. Denton*, Co. H, 4th South Carolina Cavalry, aged 34 years, was wounded at Hanovertown, May 28, 1864. Surgeon L. W. Read, U. S. V., reported the patient's admission into the field hospital of the 3d division, Fifth Corps, with "gunshot wounds of abdomen and arm; sent to general hospital." On June 5th he was admitted into Lincoln Hospital, Washington. Assistant Surgeon J. C. McKee, U. S. A., reported: "Minié ball entered three inches below left shoulder joint anteriorly, passed through the axilla under the scapula, and emerged one inch to the right of the vertebral margin. July 1st, suffers much pain in the hand and region of the wound. July 4th, arm easy; hand very painful. The daily use of hypodermic injections of morphia, etc., relieved the pain a little. August 28th, swelling in region of wound, extending over pectoral and axillary regions, to vertebral border of scapula, left side, continuing to increase from day to day. Upon consultation it was determined to be an aneurismal tumor, and pressure by spiral bandage advised, which was continued until September 1st, when the tumor increased very rapidly. The patient was quite irritable and weak. Chloroform was administered and ligation of the subclavian artery was performed. On opening the sac the tissues were found so diffused with blood and disorganized that amputation at the shoulder joint was advised and performed. Two ligatures were placed on the external jugular vein and three at the shoulder. About eighty ounces of blood, mostly coagulated, were removed from the aneurism. After the operation the patient rallied considerably. He died September 2, 1864, at 10 o'clock A. M., from exhaustion." The operator, Dr. McKee, contributed to the Army Medical Museum photographs of the anterior and posterior appearances of the aneurismal swelling, which have been accurately copied in PLATE LXXVII.

Causes of Hæmorrhage.—The earlier cases of hæmorrhage were due to the force of the blood current in the returning circulation during reaction; to commencing inflammatory action in which the swelling had been sufficient to force out the protective coagulum; to weakened arterial walls, and to a depraved condition of the blood in persons suffering from exhausting or depressing diseases. Not unfrequently the hæmorrhage of the earlier days had its source in the injury of some vessel of considerable size unnoticed in the primary examination of the wound. Cases have been cited in which no excessive hæmorrhage was noticed until attempts were made to effect the removal of a lodged missile or foreign body which had prevented bleeding by acting as a plug or tampon.

Regarding secondary hæmorrhage in its usual acceptation, as embracing all cases of bleeding from wounded vessels occurring after the establishment of suppuration, including cases of rupture of the sacs of traumatic aneurisms, we find that by far the greater number are due to the separation of a slough, the result of a contusion of the walls of the vessel and the inflammatory action consequent upon it. The time required for this process varies within very wide limits, as shown in TABLE CXLVII, p. 805, and appears to be dependent upon the size of the artery, the extent of the contusion, and somewhat upon its proximity to the heart. Ulcerative action extending from neighboring parts may attack a vessel with similar results.

Scorbutic diathesis, fevers, gangrene, pyæmia, osteomyelitis, and all conditions which lower the vital forces or alter the elements of the blood as well as the general condition of the patient and his physical health largely influence this complication. Hygienic surroundings must also be taken into consideration as playing an important part in the maintenance of a good physical status and enabling the wounded man to successfully resist the insidious attacks of disease.

Thrombosis of veins will cause great pressure on the arteries of wounded parts and re-open vessels temporarily closed:

CASE 1182.—Private J. A. Campbell, Co. H, 81st Illinois, was wounded during the Vicksburg campaign, May 22, 1863, receiving a gunshot wound of the left hand. He was admitted into Church Hospital, Memphis, whence Acting Assistant Surgeon C. H. Cleaveland reported: "Patient of a nervous, bilious temperament; had gangrene of left hand and arm. He was very deaf, and no particulars could be obtained from him except that his hand was 'bruised by a cannon shot.' An ulcer had formed at the wrist just above the annular ligament; another in the palm of the hand, commencing one inch below the wrist, laying open almost the entire palmar surface of the hand and fingers; the first and second fingers hung only by shreds from their articular surfaces, the whole surface being covered with fœtid sloughs, which were removed as effectually as possible and

bromine applied at once. A subcutaneous cavity was also found extending from the wound to near the elbow; the integument was divided upon a director and bromine freely applied. August 10th, wound cleaning rapidly at both extremities; patient troubled with anorexia and diarrhœa. At two A. M., August 14th, hæmorrhage to the extent of thirty ounces occurred from the radial artery while the patient was asleep, and soon resulted fatally. The autopsy revealed thrombi of various sizes in the circulating vessels leading both to and from the heart."

Diseases of the coats of the arteries, as atheroma, etc., will hasten hæmorrhage, and in such cases the conditions will render operative interference doubtful or uncertain.

Transportation of the wounded during the process of suppuration has been mentioned as a not infrequent cause of hæmorrhage by surgical writers, and cases recorded in the late war justify its enumeration as an exciting cause:

CASE 1183.—Private W. F. Lepper, Co. H, 148th Pennsylvania, was wounded at the Wilderness, May 6, 1864, receiving a gunshot compound fracture of the right knee joint. Surgeon J. H. Brinton, U. S. V., referring to this case,[1] remarks: "I amputated at the knee joint, at a hospital in Fredericksburg. This man did well for three days. At the expiration of this time orders were received to remove all patients from the temporary hospitals and to vacate Fredericksburg. I was subsequently informed that as this soldier was being lifted into the ambulance for transportation to the boat a sudden and uncontrollable hæmorrhage occurred, which proved almost immediately fatal. Owing to the pressing exigencies of the occasion, opportunity was not afforded for an examination of the stump after death."

Accidental causes will be found to be not uncommon, as falling out of bed, the pulling off of ligatures during delirium, falling upon stumps, and spasmodic twitchings of muscles:
